The first ironworks in America dates to the mid-1600s, but the arrival of a viable manufacturing sector awaited the fuller development of the economy in the eighteenth century. Even then, the British often suppressed the expansion of ironworks and other competitive industries in the colonies. (New York Public Library, New York)

Another of the largest American manufacturing efforts in the seventeenth century began around 1688, when the first large colonial pottery was set up in Burlington, New Jersey. The proprietor of New Jersey, physician Daniel Coxe, claimed to have spent about 2,000 pounds on the plant and planned to export stoneware to the neighboring colonies, as well as Barbados and Jamaica. The project was abandoned shortly afterward, when Coxe sold his interest in New Jersey.

Local, Household, and Plantation Manufacturing

More modest manufacturing activities serving local needs emerged in the first decades of colonization, and persisted throughout the colonial period. Kilns for the manufacture of crude earthenware appeared shortly after colonization, and home-based industry was common in the American colonies, as it was in Britain and Europe.

In textiles, the most important category of expenditure in household goods, domestic American household production coexisted with imports from Europe. The two most important textiles in colonial America were wool and linen, the latter being made from the flax plant. (Not all American flax was processed locally; much of it was exported to Ireland, the center of fine linen production.) In addition to use as clothing or bedding, textiles were also used to make sacks, wagon covers, and other essential items.

Textile production was generally a gendered activity. Women spun wool or flax into yarn. In New England and the Chesapeake in the early eighteenth century, women also took over weaving, previously a task performed by men. In the Middle colonies, however, where many male weavers from continental Europe emigrated, weaving remained a man's trade.

In all cases, spinning was a much more widely dispersed trade than weaving. Studies of wills and inventories in Chester County, Pennsylvania, a center of flax culture, from 1773 to 1776 reveal that two-thirds of the households possessed spinning wheels, while less than 8 percent owned looms.

Much of the cloth and garments produced by Americans were either worn by members of the household or exchanged with neighbors as part of a local barter economy. By the period immediately before the American Revolution, capitalist production for the market had begun to transform household textile manufacture. The development of communication and transportation networks between colonial communities in the eighteenth century also enabled more centralized household production. Certain communities were identified with a particular kind of manufactured good, which was then sold over a wide area. For instance, Germantown, Pennsylvania, became known for "Germantown stockings," of which many thousands of pairs were made annually. Lynn, Massachusetts, was a center of shoemaking.

While women worked on household textile production, European and Native American men found productive ways to occupy themselves during periods when the demands of agriculture were low. They availed themselves of America's abundance of trees to make potash from wood ash, cedar roofing shingles, and barrel staves of red and white oak, although the barrels themselves were made by specialists known as coopers. (In addition to their use in American storage and shipping, barrels and casks were also exported to the West Indies.) Gourds were dried and made into containers and vessels.

Among specialized local producers were shoemakers, who, unfortunately, left few records. In New England and the Middle colonies, blacksmiths made items as varied as nails, door hinges, andirons, simple locks, latches, tongs, trivets, wrought-iron candlesticks, pothooks, horseshoes, and harness parts.

The slaveholding societies of the colonial South followed a different pattern. Much of the limited manufacturing that took place was carried out by slaves, often providing only necessary goods for a plantation and its owners rather than items intended for trade. Southern blacksmiths, for example, whether indentured servants or, increasingly, slaves, made a more limited range of goods than their Northern counterparts, and many Southerners imported the iron products they needed.

The vast majority of slaves' work was in the areas of agriculture and domestic service, but slaves were also spinners, weavers, tanners, shoemakers, coopers, wheelwrights, and cabinetmakers. Slaves were industrial laborers as well. Maryland and Virginia iron foundries in the eighteenth century relied on slave workers. In the North, some Pennsylvania iron enterprises used slave labor and petitioned for a reduction of the tariff on slaves in 1727.

Expansion of Manufacturing

The development of the American economy in the late seventeenth and eighteenth centuries led to the expansion and diversification of manufactures. The growth of printing meant that printers had to have paper. The first American paper mill was constructed at Germantown, Pennsylvania, in 1690. The limiting factor for American papermakers was the shortage of rags, the basic material for paper in the eighteenth century.

Another industry that emerged in the eighteenth century was coppersmithing. This had little to do with the opening of American copper mines, the first being established near Simsbury, Connecticut, in 1705. American copper mines usually exported their ore to England to be refined. American coppersmiths then imported the refined copper in the form of sheets, which they made into teapots, warming pans, bells, and brass surveying instruments. Like blacksmiths, coppersmiths also recycled metal goods.

In addition to the establishment of new industries, old ones continued to grow. In 1739, German immigrant Caspar Wistar, using German workers, built the most successful colonial glass factory in Alloway, New Jersey. Wistar was also one of the few early American buttonmakers.

Britain and Colonial Manufacturing

In the seventeenth century, British authorities' principal motivation for regulating American production was to retain the American and West Indian markets for British manufacturers. A 1699 law forbade the export of raw wool, yarn, and finished fabrics from the colonies by ship, as well as the transportation of these materials by horse or cart from one colony to another. In fact, few American manufactured goods could compete with British products at this point, although the colonial shipbuilding industry had begun to establish itself as a force.

When it came to the development of American industry, British authorities preferred shipbuilding to the establishment of a colonial textile industry. The board of trade refused to intervene against colonial shipbuilders, when so requested by Thames shipwrights in 1724. The board feared that suppressing colonial shipbuilding would force Americans to develop an export textile business to pay for imports from Britain. British industrialists were also concerned about the lure of America's high-wage economy for their most skilled workers. The development of American ceramics was pronounced enough that the English pottery magnate Josiah Wedgwood was concerned about both the potential emigration of his company's skilled craftspeople and the possible loss of the American market.

Britain did not oppose all American manufactures. It did support American industries that complemented rather than competed with British industries or those that filled British needs. For instance, Britain encouraged the colonies to produce naval necessities, such as pitch and turpentine. Policy also could be influenced by different interests. British iron producers attempted to suppress colonial competition, while manufacturers who used iron welcomed colonial supplies.

The Royal Society of Arts, a group founded in London in 1754 that included some American members, particularly encouraged a revival of the old project, going back to the Virginia Company, of an American silk industry. Silk was a product Britain itself could not effectively produce. The society concentrated its efforts on the far Southern colonies, particularly Georgia, where it cooperated with the colony's proprietors. A group of Italian silk workers was established at a Savannah filature, where the silk cocoons would be wound into thread. Although the workers successfully produced silk thread, the project proved economically unviable and was abandoned by 1771. South Carolina silk was even less successful. The Society had more success in encouraging the development of the colonial potash industry, an effort encouraged by Parliament, which lifted the tariff on American potash in 1751.

Politicization of Manufacturers

Although colonial manufacturers had always had to reckon with the British government's insistence that home industries not be harmed by colonial ones, the question of manufacturing was even more politicized during the decades before the American Revolution. Repressive British legislation, such as the Townshend Acts, was answered with a series of nonimportation movements, designed to discourage Americans from paying for British goods and to encourage American manufactures. In 1767, a Boston town meeting coupled a call to lobby Parliament to repeal the acts with a call for American authorities to provide bounties for domestic manufactures. This call was heard from many other quarters as well.

The effort to promote American manufacturing in the decades before the Revolution took many forms. In New England and Pennsylvania, there was an attempt to revive and expand domestic spinning. Ministers, newspaper proprietors, and local societies for the promotion of arts sponsored spinning bees and competitions for young women, often imbued with a patriotic flavor. More than sixty spinning parties were reported in local New England newspapers in the 1760s. These meetings usually took place at ministers' houses and were put forth as examples of women's patriotism.

Harvard students flaunted their patriotism by appearing at commencement in outfits entirely American in origin (although America had always produced much of its own clothing). Patriotic colonists in New England, New York, and Pennsylvania were encouraged not to eat lamb, so as to increase the supply of wool. The duty on the importation of paper also led to efforts to encourage the gathering of rags for use by colonial papermakers.

Other efforts to strengthen American industry were on a larger scale and organized on a more capitalistic basis. The earliest surviving American porcelain was made at Southwark in Philadelphia from 1770 to 1772 by the firm of Gousse Bonnin and George Anthony Morris. Bonnin, the leader of the venture, the American China Manufactory, associated his enterprise with American liberty and patriotism, pointing out that Philadelphians were spending 15,000 pounds a year on imported porcelain. He recruited English workers and produced soft-paste porcelain in the manner of the English Bow factory. The firm's failure may have been due to a deliberate effort to sabotage it by dumping British and Dutch porcelain on the American market, although labor difficulties also contributed to its woes. Despite the efforts of Bonnin and other ceramicists, American ceramics were still not of the quality to compete with Wedgwood and other leading British producers—efforts to duplicate Wedgwood's popular creamware or queensware in America were unsuccessful—and imports continued to dominate the market.

There also were several attempts to address the needs of American shipbuilders for sailcloth and cordage by encouraging Americans to raise hemp. The Society for the Promotion of Arts, Agriculture, and Oeconomy (also known as the New York Society of Arts) was founded in New York in late 1764 by merchants of the city's patriot faction. It focused principally on the development of linen manufacture. The Society succeeded in employing 300 people in the industry and attracted the unfavorable notice of the Board of Trade.

Philadelphia's American Philosophical Society was less successful in its alliance efforts with Philadelphia merchants and the Pennsylvania legislature to promote the silk industry. The society also requested that clays be submitted to it to determine the best deposits for different kinds of ceramics, offered premiums for rags for papermaking, and supported one of the few American glassmakers attempting to make a superior product, Henry William Stiegel.

Stiegel founded a glassworks at Manheim, Pennsylvania, in 1768. He planned to manufacture the highest-quality glass, known as flint glass, and the society gave its official approval. One important advantage of flint glass was its superior optical qualities, which the American Philosophical Society, the country's leading scientific organization, was in a position to certify. The society's efforts were in vain, however, as high labor costs and foreign competition forced Stiegel to close his glassworks in 1774.

Another, more effective Philadelphia organization was the United Company of Philadelphia for Promoting American Manufactures, headed by Benjamin Rush. Founded in 1775, it concentrated on textiles and soon employed 700 people. This company survived until the occupation of Philadelphia by the British in 1777.

The British response to the development of American industry in the late eighteenth century concentrated particularly on textiles, the basis of the British export economy—in 1772, woolen textiles comprised over 30 percent of British exports to the thirteen colonies. In 1766 and 1768, the Board of Trade required colonial governors to submit reports on all colonial manufactures established since 1734, though most governors described the manufacturing activity in their colonies as negligible. In 1774, Parliament prohibited the export from Britain of tools used in textile manufacture.

Benjamin Franklin, in an interview before the House of Commons, had pointed out that colonists might produce their own manufactured goods if Britain imposed tariffs on exports to America. Therefore, textile manufactures, along with other products of British industry, were omitted from the Townshend duties of 1767. As with the restriction of other freedoms, the quarrels between Britain and the colonies over regulating manufactures contributed to the outbreak of the American Revolution.

Maps and Surveys

Maps of the Americas made by Europeans and colonists progressed from crude outlines, based on dead reckoning and observation, to precise works reflecting the efforts of professional surveyors and cartographers.

Early Maps

European expansion in the fifteenth and sixteenth centuries was accompanied by a rising concern with accurate mapping, which was complicated by the difficulty of reconciling several accounts into a single map. The *Casa de Contratación*, founded in 1503 to oversee and regulate Spanish movements to the New World, emphasized accurate cartography and navigation. In 1512, the “royal pattern,” a continuously updated cartographic pattern, was established. The Spanish could not maintain a monopoly on New World cartographic information, however, and maps circulated widely in the sixteenth century.

The first published map to include the word “America” and to depict North and South America with a continuous coastline was the German scholar Martin Waldseemüller's *Cosmographica* (1507). New World maps also were included in the first known atlas, Abraham Ortelius's *Theatrum Orbis Terrarum* or

Theater of the World (1570).

Latecomers to the New World, the English were also latecomers to New World mapping. The first published map of the New World originally produced (as opposed to maps that were adapted from Continental ones) by an English cartographer was John White's map, which was included in the 1590 edition of Thomas Harriot's book *A Briefe and True Report of the New Found Land of Virginia*. John Smith was another early English mapper.

Maps and Politics

Maps served many functions in colonial society. One of the most significant functions was expressing—and advancing—political claims. The French cartographer Guillaume Delisle published a technically excellent *Map of Louisiana and the Course of the Mississippi* (1718), which was particularly influential in its treatment of the Gulf of Mexico. The map also aggressively advanced the French position in North America, restricting the English holdings in the Southeast to the territory east of the Alleghenies. (French cartographers had the advantage over English of much more knowledge of the interior of North America.) Herman Moll fired back in 1720 with *A New Map of the North Parts of America Claimed by France*, minimizing French claims and expanding English ones.

Politically speaking, the most important map produced in the colonial era was one by Dr. John Mitchell. The first edition of the map appeared in London in 1755, with the title *A Map of the British and French Dominions in North America*. Sponsored by the Lords Commissioners for Trade and Plantations, the Mitchell map precisely delineated the maximum extent of English claims, even to the Pacific. The fourth edition of this map, published in 1775 after the British conquest of Canada in the French and Indian War, was titled *A Map of the British Colonies in North America with the Roads, Distances, Limits and Extent of the Settlements*. This map later became the cartographic basis of the territorial negotiations between Britain and America at the conclusion of the Revolutionary War.

In addition to being used in political struggles between empires, maps also influenced what happened within nations. Poor understanding of local geography meant that grants of land made in London often had vaguely defined boundaries or overlapped with other grants. Colonies produced maps that supported their boundary claims against those of their neighbors.

Maps also made economic claims. New York officials, in communicating with the government in England, used deceptive maps that showed easy access from New York to Iroquois country, claiming that this meant the government should put more resources into the colony to support the fur trade with the Native Americans of the North.

A map also helped to reinforce ownership. The second Lord Baltimore, proprietor of Maryland, rewarded the Prague-born Augustine Herrman with a manor of 13,000 acres for his map *Virginia and Maryland as It Is Planted and Inhabited This Present Year 1670* (1673).

Surveying

Mapping was part of the Europeans' great endeavor to know the strange new lands. Mappers drew on Native American knowledge, as well as their own observations and European cartographic techniques. As more land in the Americas was conquered, settled, and explored by Europeans, there was an increased need for accurate, or at least mutually agreeable, boundary lines to demarcate individual properties.

The work of surveyors included establishing boundaries, laying out towns, plotting the course of roads, dividing properties between heirs or purchasers, and a host of other tasks. Surveying had developed in Europe in the mid-sixteenth century as a mathematical and astronomical discipline. In America, surveyors were handicapped, relative to their European counterparts, by the dense woods in some areas, which made taking a long view difficult if not impossible. European surveyors often used church spires, usually the highest point in a village or town, as a landmark; again, this was impossible in less developed parts of the colonies.

The bulky theodolite, a standard tool for taking the azimuth in Europe, was less popular in America, where the more portable circumferentor or surveyor's compass was better adapted. The first basic text specifically adapted for American surveying, John Love's frequently reprinted *Geodaesia, or the Art of Surveying and Measuring of Land Made Easy* (1688), recommended against the theodolite based on Love's surveying experience in Jamaica and North Carolina.

Simple surveying, establishing property lines, was a common profession for landowners and sons of the landowning class, the most famous example being George Washington. Surveying also could be a lucrative profession: In Virginia, surveyors were allowed to charge forty pounds of tobacco per 100 acres surveyed. In addition to these private surveyors working for landowners, individual colonies also appointed surveyors general for government work, and some counties did the same. An early example was Richard Norwood, employed by the Bermuda Company to survey its newly acquired islands in 1610. Thomas Holme, surveyor general of Pennsylvania, planned and laid out the city of Philadelphia.

Important eighteenth-century surveyors general included Cadwallader Colden in New York and Nicholas Scull and William Parsons in Pennsylvania. In Virginia, the position of surveyor general was a perquisite of the College of William and Mary.

Late-Colonial-Era Mapping and Surveying

The growing sophistication of American surveying helped improve cartography. The mid-eighteenth century saw an outburst of maps published by professional surveyors. Peter Jefferson and Joshua Fry's *Map of the Inhabited Parts of Virginia* (1754), commissioned by the colonial government, was a frequently reprinted example and one of the sources of John Mitchell's map. Jefferson was a leading Virginia surveyor (and Thomas Jefferson's father), and Fry was a former professor of mathematics and natural philosophy at William and Mary who had previously worked with Jefferson tracing the border between Virginia and North Carolina in 1747. The Welsh-born Lewis Evans was another significant American surveyor, mapper, and cartographer, who created *General Map of the Middle British Colonies in America* (1755).

Despite the growing sophistication of American cartographers, however, printing maps was a different matter. Because of superior skills and technology, the best maps of America continued to be published in London or elsewhere in Europe throughout the colonial period. In fact, many of the most expert

surveyors and cartographers in the decades preceding the American Revolution continued to be immigrants or visiting experts from Europe.

The most famous and technically most sophisticated boundary line drawn in colonial America, the Mason-Dixon Line, which established the boundary of Pennsylvania and Maryland, was named after two Englishmen. The boundary between the original royal grants to the Calverts of Maryland and the Penns of Pennsylvania had never been clear, leading to a dispute that lasted for many decades. American surveyors lacked the technical skill to resolve the issue, and English surveyors had the advantage of impartiality between the contenders. The astronomer Charles Mason and the surveyor Jeremiah Dixon, along with their equipment, came from England to Philadelphia in November 1763.

Before getting to the main business of tracing the Maryland-Pennsylvania boundary, the two Englishmen fixed the southern limit of Philadelphia and traced the boundary between Pennsylvania and Delaware. They began their main task in 1765, accompanied by axemen, clearing a corridor about 10 yards wide and employing a recently invented instrument, the zenith sector, which the Mason-Dixon expedition had introduced into American surveying. They faced bad weather, geographical barriers, including the Susquehanna River and the Blue Ridge Mountains, and suspicion from local Native Americans. The line, over 233 miles long, was concluded on October 9, 1767. Mason and Dixon's effort raised the level of American surveying.

The British acquisition of Florida following the French and Indian War (known as the Seven Years' War in Europe) led to a burst of surveying and cartographical activity, at first more associated with the British government in London than with American cartographers. The German immigrant William Gerard de Brahm, a surveyor and military engineer, had already produced important maps of the Southern colonies, beginning with the frequently reprinted *Map of South Carolina and a Part of Georgia* in 1757. Appointed surveyor general for the new Southern Department, de Brahm and his assistant, the Dutchman Bernard Romans, surveyed the coasts of Florida in the 1760s and early 1770s. Romans established contacts with American scientists and mariners and combined natural history with cartography, publishing the *Concise Natural History of East and West Florida* in 1775.

Marquette, Jacques (1637–1675)

Father Jacques Marquette, also known as Père Marquette, was a French explorer and Jesuit missionary. He spread Christianity among Great Lakes Native American tribes from 1666 to 1675 and accompanied Louis Jolliet as chaplain on the first European expedition to extensively explore the Mississippi River.

Jacques Marquette was born on June 1, 1637, to a prominent family at Laon in the north of France. He entered a Jesuit school at Nancy in 1654. Marquette studied and taught at various Jesuit schools in France, where he earned mediocre marks but gained expertise in many languages. He dreamed of overseas missionary work in the pattern of his role model, the great Jesuit proselytizer Francis Xavier.

Marquette realized his dream in 1666 when he received orders to become a missionary in New France, France's North American colony. Three weeks after arriving in Quebec, Marquette traveled to the Jesuit mission at Three Rivers, where he began a course of study that resulted in his mastery of six native dialects. In 1668, he began working for the Ottawa mission at Sault Sainte Marie, and he succeeded Father Claude Allouez at La Pointe in Chequamegon Bay in 1669. Unpleasant relations with the Sioux forced Marquette and his converts to flee to the St. Ignace mission at Mackinac in 1671.

While imbued with a strong work ethic and a devout sense of mission, Marquette met with limited missionary success among the native peoples. Generally, only the very young, elderly, or ill accepted Christian baptism. Other efforts to convince Native Americans to become less nomadic, plant fields, and save surplus food for famine times also yielded discouraging results.

Despite the small number of converts, Marquette enjoyed as much or more success than other missionaries. The efforts of Jesuit missionaries such as Marquette also made for amicable relations between most Native American tribes and the French. The Jesuit practices of accepting native culture, learning native languages, and living among the native population created a sense of trust between the two cultures. This allowed for a flourishing fur trade and less direct hostility as compared to other European colonization efforts.

In 1673, Marquette further satisfied his yearning to spread Christianity to people who had never encountered it when he agreed to be chaplain on Louis Jolliet's expedition to explore the Mississippi River and discover its mouth. On May 17, 1673, the two men, accompanied by five oarsmen, set off across Lake Michigan from St. Ignace. They traveled to Green Bay and through Wisconsin, arriving at the Mississippi River on June 17, 1673, thus becoming the first Europeans to explore the river at any significant length.

They followed the waterway south until they were a few miles downstream of the mouth of the Arkansas River. Their journey ended there after an encounter with a village of Quapaws. At first hostile toward the Europeans, the Native Americans befriended the party after a native translator was found who communicated with Marquette in the Illinois dialect. Convinced that they were close to the mouth of the Mississippi River, and that the river definitely flowed south into the Gulf of Mexico and not west to the Gulf of California, the explorers turned back to avoid entanglements with the Spanish.

Marquette's duties on the adventure included translating, spreading the word of God, being a symbol of goodwill (it was believed that the "black robes," as they were known, had a peaceful reputation among native peoples), and keeping a detailed journal. Since a canoe accident destroyed Jolliet's journal and forced him to recount his trek from memory, Marquette's journal became the only original account of the expedition; it was published in 1681.

The French Jesuit missionary Jacques Marquette accompanied Louis Jolliet as a chaplain on his exploration of the Mississippi River, the first by white men, in 1673. (Brown Brothers, Sterling, Pennsylvania)

The arduous return journey began on July 17, 1673. Instead of retracing their steps, the group was convinced by a band of Illinois encountered on the return trip to travel the shorter route up the Illinois River to present-day Chicago. Winter's approach eventually halted the group at Green Bay, where Marquette took ill. Realizing that he would not survive the trip back to Montreal, he received permission to return to work with the Illinois, which he did until his health failed again.

Marquette died at the mouth of the Père Marquette River at present-day Ludington, Michigan, on May 18, 1675, as he endeavored to return to St. Ignace. Christianized Native Americans exhumed his remains two years later and interred them at Mackinac.

Marriage and Divorce

Marriage was a common state for most people in the seventeenth and eighteenth centuries, whether European, African American, or Native American. The primary differences between these marriages lay in how the marriage ceremonies were conducted and the specific roles of the two spouses once married.

English, Dutch, and Scottish Traditions

The original thirteen colonies were governed by English law, derived from Anglo-Saxon tradition. Following settlement, each colony then modified English law to create its own marital codes.

Marriage was seen as a choice made by both partners. As part of that choice, the woman agreed to have her legal identity become part of her husband's. This act was called *coverture* and the wife was referred to as a *feme covert*—terms borrowed from the archaic French still used in English law. Her husband became owner of all her property, both land and movable (as objects were called). He also received the right to manage and collect rents on any property she owned.

Any children resulting from the marriage could not inherit land from their mother until their father's death. If the husband consented, however, a marriage contract written before the ceremony could specify property to remain in the woman's possession. Wealthy families often did this as a means of protecting their investment in a dowry.

In eastern Virginia, Maryland, Georgia, and the Carolinas, the process of being married in the Anglican church often took several weeks or months. Following engagement, the marriage was officially announced by calling the banns in church on three successive Sundays. The ceremony was conducted in the church and was followed by a celebration and the consummation of the marriage. All five components were considered necessary for the wedding to be legal. Vows could not be taken during Lent, Advent, or the three weeks prior to the Feast of Saint John.

Marriage among Quakers in the Mid-Atlantic colonies also followed a specific process. Quakers were expected to marry other members of the Quaker faith. They also could not marry first cousins or, sometimes, even second cousins. Finally, the couple had to be approved by the community. As a result of these restrictions, many Quakers chose not to marry. The average marital age was also higher than among other cultural groups.

Once the marriage was approved, the wedding was officially announced to the community. During the ceremony, the group gathered together in silence. As was common to Quaker religious meetings, the members were given time to speak upon the marriage as they wished. Finally, the couple declared their intention to marry in their own words. After the marriage, they settled in their home and continued their lives as part of the Quaker community.

Marriage for the Puritans of New England—like that between Dr. Francis Le Baron and Mary Wilder of Plymouth—was a civil contract rather than a religious one. The couple established a covenant between themselves and the state. (Library of Congress, LC-USZ62-12716)

According to the Pilgrims and Puritans of New England, marriage was a civil contract rather than a religious one. Courtship was usually a lengthy process in order to enable the couple to become fully acquainted. Following courtship, the couple agreed to form the marriage as a covenant between themselves and the state. As in the other cultural groups, the service was followed by a meal. While the civil marriage custom was unique among English colonists, similar practices were conducted in the Protestant low countries, where the Pilgrims had lived prior to coming to North America. Dutch colonists in New York also conducted civil marriages.

Marriages in unsettled areas all over the colonies reflected the customs of their inhabitants. As legal and religious officials were rare, marriage could be as simple as having the man and woman agree publicly to live together. Regardless of who officiated, marriages were usually occasions for much celebrating. Scottish and Scots-Irish colonists often followed the Scottish tradition of "handfasting," by which the couple would agree before two witnesses to live together for a year and a day. If they were content with the agreement at the end of this time, they would seek out official religious or legal status. If not, they were free to separate.

French and Spanish Traditions

The other two countries primarily involved in European colonization of North America were France and Spain. Both took their code of law from Roman tradition, which recognized the husband and wife as separate persons who could continue to own property separately after marriage. Any property acquired during the marriage was owned jointly, and land was passed down to their heirs. Despite these legal protections, French and Spanish households functioned very much as English households did, with the husband or head of the household making the primary decisions.

These laws were employed in the regions settled by the French and Spanish: Florida, Louisiana, California, Acadia, and Quebec. Following the acquisition of Louisiana in 1803, the United States allowed local property customs to continue.

Another difference between France, Spain, and England was the Catholic tradition of celibacy for monks, nuns, and priests. Several religious groups settled in the French and Spanish colonies, setting up communities similar to their European counterparts. Following their captivity by the French during the colonial wars of the early eighteenth century—including Queen Anne's War, King George's War, and the French and Indian War—some English women chose to live as Catholic nuns in New France rather than to marry.

African American and Native American Marriage

As formal, legal marriages were usually forbidden between African American slaves, weddings between slaves often followed traditions brought from Africa. One such custom consisted of the couple leaping over a broom together in the presence of other slaves. If possible, the ceremony was followed by a celebration of some form.

Native American marriage customs varied from tribe to tribe. These marriages followed a formal process and had to be sanctioned by other members of the tribe. As in most cultural groups of the period, marriage was as much about the community as it was about the couple.

Divorce

While divorce was not impossible under English law, it was almost unheard of in the Southern colonies. Physical separation was possible for wealthy women who could appeal to the courts for separate maintenance by their husbands in cases of abuse or neglect. In 1681, William Fitzhugh sought a legal separation for his abused sister-in-law, Rose Blackston. The separation was denied, and she eventually eloped with another man in 1697. Poor women were dependent on their family or friends for help, although sheltering a runaway wife was grounds for punishment.

Divorce was also almost nonexistent among the Quakers and the various European Protestant sects living in the Mid-Atlantic colonies. Settlers in the backcountry colonies, where formal marriages were less common, were more likely to desert a bad marriage, provided that it was financially possible.

In contrast, divorce under certain conditions was allowable in the colonies of Connecticut, Massachusetts, and Rhode Island. A married person seeking divorce had to be able to clearly prove willful desertion, adultery, bigamy, or impotence to a court of law.

Bigamy and desertion were relatively easy to prove, and most successful divorce cases involved either situation. Desertion was defined as three years of neglect of duty or seven years' absence. In 1680, Elizabeth Wade Stevens successfully demonstrated that her husband, Thomas Stevens, already had wives in Boston, England, and Barbados. She was given a divorce and granted the right to marry again. A common penalty for divorce was to require that neither party marry again.

Demonstrating adultery or impotence as grounds for divorce required personal testimony and so was much harder to prove. Martha and John Hewitt of Plymouth Colony were married in 1667. Shortly afterwards, it became evident that Martha Hewitt was four or five months pregnant. Faced with fornication charges, John Hewitt refused to acknowledge paternity. Circumstantial evidence suggested that Martha Hewitt's father, Christopher Winter, was the father of the child. In March of 1668, Martha Hewitt and Winter were brought to court in Plymouth County on an incest charge. Citing lack of concrete evidence, the case against Winter was dropped, and his daughter was whipped for fornication before marriage. In June of 1669, John Hewitt attempted to divorce his wife Martha on grounds of adultery. As the charge against her father had never been conclusively proven, the divorce suit was turned down.

Following a rejected divorce suit, Massachusetts colonists had the same options as their counterparts in the other colonies. Wealthier colonists could set up separate households in one form or another. Desertion was another possibility, leaving the other spouse to appeal again for divorce after the required seven years waiting period. Most, like John and Martha Hewitt, were left to make the best of a bad situation. In nearly all cases of separation or divorce between European colonists, the husband maintained ownership of land and house and was given custody of the children.

As formal marriages were rare between African Americans, divorce usually consisted of the couple simply agreeing to separate. A couple also might be parted because one member had been sold to a different plantation. Most Native American tribes allowed for divorce as a means of maintaining stability within the tribe. The couple quietly agreed to separate, and their lives continued without penalty. As the United States became a country, both African Americans and Native Americans became more subject to marital codes and practices based on European laws and traditions.

Mary I (1516–1558)

Mary Tudor, born February 18, 1516, in London, was the only surviving child of Henry VIII of England and his first wife, Catherine of Aragon. As the heir to the English throne, Mary received a careful education supervised by the Spanish humanist Vives, during the course of which she developed a deep Roman Catholic piety and began to take great pride in her descent from Ferdinand and Isabella of Spain.

Until the beginning of Henry VIII's divorce proceedings in 1529, Mary was treated as princess of Wales, with a court at Ludlow. As a desirable royal bride, she was courted by Francis I of France and Charles V of the Holy Roman Empire. After Henry's marriage to Anne Boleyn, however, Mary was declared a bastard and became a servant in her stepsister Elizabeth's household. Throughout her exile, Mary continued to be a practicing Roman Catholic. She also was protected by Charles V's ambassador and supported by many English people, who had loved Catherine of Aragon and respected Mary as the king's legal daughter.

Jane Seymour, Henry VIII's third wife, reconciled Mary and her father. She also persuaded Mary to acknowledge the Act of Succession recognizing Henry VIII as head of the church. In 1544, shortly before his death, Henry VIII restored both of his daughters, Mary and Elizabeth, to the succession, after their brother Edward. Mary had close and affectionate ties to her younger brother, and her position throughout his reign remained privileged, despite attempts by the Seymours and John Dudley, duke of Northumberland, to hide her Catholicism and curtail her popular charitable donations. When Edward VI died in 1553, Northumberland and leading Protestants attempted a coup on behalf of Lady Jane Grey, who ruled for nine days before Mary rallied support in England's central counties and marched on London to overthrow Jane in July 1553.

Queen Mary I is known as “Bloody Mary” for her execution of Protestants in the mid-sixteenth century, yet her efforts to restore Catholicism to England ultimately proved unsuccessful. Nor did she advance the nation's colonial interests or sea trade for fear of intruding on Spanish claims. (Brown Brothers, Sterling, Pennsylvania)

As queen, Mary I enjoyed early support from even Protestant subjects, who acknowledged her as Henry's daughter and looked forward to her reign, especially after she retained most of the council, making the government inclusive and widely representative. The new queen also moved slowly to restore Catholicism, retaining the Act of Supremacy placing herself at the head of the church in England, and making no move to reverse the dissolution of the monasteries and sale of church property. However, Mary I inherited a huge debt of 700,000 pounds from Edward VI's reign and confronted poor harvests across England.

In 1554, Mary I married her cousin Philip II of Spain, son of Emperor Charles V. In response, Sir Thomas Wyatt and several thousand Protestants rebelled in favor of her younger sister, Elizabeth. The rebels were crushed when Mary I led troops out of London against them. The queen ordered the execution of Wyatt, as well as Jane Grey, her husband, Guildford Dudley, and the duke of Suffolk for their part in the rebellion.

The return of Cardinal Reginald Pole to England with absolution from the pope saw the return of medieval heresy laws and their swift implementation. Mary I burned as heretics more than 300 English subjects, including Archbishop Thomas Cranmer, while hundreds of Protestant families fled to Calvinist Geneva. The burnings were quickly memorialized in John Foxe's *Book of Martyrs*, which became a classic colonial text, propagandizing anti-Catholicism and the villainy of Queen Mary I and the Spanish.

Much to the disappointment of the English merchant community, Mary I did not advance English sea trade and colonial interest for fear of infringing on Spanish claims, nor did she push England to fight for more of the wealth of the Americas. Instead, the Spanish involved Mary I in declaring war on France in January 1557. English campaigns in France were a fiasco, losing England's last continental possessions, Ham, Guines, and the port at Calais.

Mary I suffered two false pregnancies, the second probably an ovarian tumor. At the time of her death on November 17, 1558, having failed to join England to Spain, produce an heir, or restore Catholicism to the nation, she was succeeded by her half sister, Elizabeth I.

Maryland

Maryland's founding represented an early example of a shift in English colonial policy. While joint-stock companies had established colonies such as Virginia and Massachusetts Bay, England's King Charles I granted Cecilius Calvert, Lord Baltimore, a proprietary charter for the colony of Maryland. The Calvert family remained proprietors of the colony until the American Revolution, except for a period from 1691 until 1715, when the British Crown administered Maryland as a royal colony.

Throughout its existence, the colony witnessed a power struggle between the elected colonial legislature and proprietary officials. Although there was some ebb and flow in this contest, in general, the proprietor maintained a strong hold on the colony until the 1770s.

Origins of European Settlement

In 1632, King Charles I awarded land on both sides of Chesapeake Bay to the Calvert family. At the time of the grant, a diverse Native American population resided in the area. The Doeg, Mattawoman, Choptico, Patuxent, and Piscataway comprised a confederation on the western shore of the bay; the Nanticoke, Choptank, Pocomoke, and Wicomico resided on the eastern side; and the powerful Susquehanna lived at the north end of the bay. All told, at least 8,000 Native Americans lived in the region in the 1630s.

In the second half of the seventeenth century, these various populations declined sharply as many died from European diseases such as smallpox. As the number of Native Americans shrank, Europeans drove them from the land to establish farms for the cultivation of tobacco. By 1700, the European immigrant population controlled the bay area.

In 1634, Leonard Calvert, Lord Baltimore's brother, sailed into the Chesapeake as the first governor of Maryland. On board also were twenty gentlemen, most of whom, like the Calverts, were Roman Catholic, and approximately 130 artisans and laborers, most of whom were Protestant. They established the colony's first capital, St. Mary's, along the western shore. Lord Baltimore envisioned Maryland as a refuge for England's persecuted Catholics, but also as a profitable venture.

Catholic emigration to the colony remained slight, and the Protestant population soon dominated Maryland. To protect the Catholic minority, Baltimore drafted the Act Concerning Religion in 1649, which ensured religious freedom. Although limited to Christians, it was an early expression of religious toleration in European North America.

Agriculture

Taking their cue from Virginia, early Marylanders began growing tobacco for sale in Europe. Lord Baltimore initially encouraged the creation of large medieval manors, but the availability of land in Maryland created staffing problems for these large estates, as tenants left to establish their own farms.

In 1640, Lord Baltimore adopted the headright system to spur population growth: the proprietor granted 100 acres of land for each man, another 100 acres if he brought his wife, and fifty acres for each child brought to the colony. Colonists could gain additional acres if they brought indentured servants. In return for passage to America, these servants worked for the planters for some number of years, often four, at the end of which the planters provided them with freedom dues—that is, land, tools, and seed, and/or money to purchase these. Many servants did not live until the end of the indenture due to diseases such as malaria and dysentery. As planters relied on indentured servant labor, slavery was rare in Maryland in the seventeenth century.

Government

In 1635, Maryland settlers called for a representative assembly. The Calverts reluctantly agreed and formed the House of Delegates. Beginning in 1639, all free men became eligible to elect members to this body, which became the lower house of the legislature. The governor collected a group of advisors, which evolved into the colonial council or upper legislative house. Initially, wealthy Catholics and Protestants sat on the council, while less wealthy Protestants dominated the assembly.

Despite the toleration act, early Maryland experienced considerable religious tension. In 1688, while England was in revolution, the smaller planters seized the colony in the name of King William and Queen Mary. Maryland became a royal colony in 1691, and the Anglican Church became its official church in 1702. Catholics lost the right to vote and worship in public.

In 1715, the fourth Lord Baltimore joined the Anglican Church and regained the proprietorship of Maryland. During royal rule, the assembly had increased its power at the expense of the governor. Gradually, the proprietor and his governor reasserted their control over the colony, culminating in the fifth Lord Baltimore's trip to Maryland in 1732. During this visit, the proprietor stripped the assembly of much of the legislative power it had assumed during the previous fifty years. Although this initially produced some grumbling, a rebound in the price of tobacco between 1740 and 1770 sparked the Maryland economy and quieted discontent.

Population

Maryland's population remained small and egalitarian through much of the seventeenth century. The colony contained few women, hindering natural population growth. By 1675, Maryland contained roughly 13,000 colonists.

The first Africans arrived in Maryland in 1642. Their legal status seems to have been similar to that of indentured servants. Slavery only began to develop as an institution in late seventeenth-century Maryland, and adoption of slave labor was slow. In 1697, slaves comprised just 10 percent of the colony's 30,000 non-Native American inhabitants.

In the eighteenth century, a permanent economic and social elite formed in the colony. Many of these gained their riches from tobacco production and added to that wealth by purchasing slaves. By 1710 Maryland contained 8,000 slaves, and, by 1762, slaves constituted 30 percent of the total population. Most slave owners had fewer than five slaves, though a few large plantations had more than 100. Maryland's free black population remained quite small and could not vote, hold office, or testify in court.

After 1700, Maryland saw considerable growth. Annapolis had become the capital in 1694, Scots-Irish and German immigrants established inland settlements, and bay area towns such as Chestertown, Joppa, and Baltimore prospered.

While Maryland's total population and the number possessing moderate wealth grew, wealthy elites dominated colonial offices until the American Revolution. The colonists loosely adhered to the social deference common in Europe; however, Maryland elites increasingly distinguished themselves from their social counterparts in England. The influx of women augmented the natural birthrate, and the adoption of slavery created a fixed social elite.

Wars

Beginning in 1754, the French and Indian War (known as the Seven Years' War in Europe) resurrected religious tension in the colony as some suspected Maryland Catholics of aiding Catholic France against them. The war also afforded the assembly an opportunity to assume greater control of the colonial budget, arguing that additional funds would strengthen the colony against French attack. In fact, Maryland provided little assistance to the British war effort.

Like other British colonies, Maryland experienced the distinct change in British imperial policy following the end of the French and Indian War in 1763. Most Marylanders were hardly bothered by the Sugar Act and Currency Act of 1764, but they loudly protested the Stamp Act of 1765. Assemblymen led demonstrations at which colonists burned in effigy the royal stamp distributor. Local chapters of the Sons of Liberty formed to coordinate protests. Daniel Dulany, Jr., published an inflammatory pamphlet asserting that Parliament had erred when it issued the Stamp Act.

Opposition to parliamentary rule in Maryland was less than in other colonies. Protestors belatedly drafted a nonimportation agreement in 1769 and, a year later, formed the Baltimore Association to enforce adherence to this agreement. The relative quiet of the early 1770s ended in 1774 when colonists learned that Parliament had closed Boston Harbor. A new nonimportation association formed, and, in October of that year, Marylanders burned the ship *Peggy Stewart* and its cargo of tea.

Anti-British radicals created an illegal convention to administer the colony, created Committees of Correspondence, and named delegates to the Continental Congress. For the next two years, Maryland experienced dual government as the convention legislated for the colony, and the governor, Robert Eden, continued to direct colonial officers. In 1775, the convention created a militia to defend the colony against the British military. Governor Eden left Maryland in June 1776 as fighting increased throughout the colonies.

After the Revolution

Following the Declaration of Independence, Maryland held a constitutional convention to create a state government. Men owning fifty acres of land or property worth 40 pounds were given the opportunity to select delegates to this convention. The constitution they produced resembled in structure the colonial government minus the proprietor. It also reflected the conservative nature of the delegates.

All white men possessing property worth at least 20 pounds could vote, but only those worth 500 pounds could hold office in the lower house of the new state legislature. Seats in the upper house, in the executive council, as delegates to the Continental Congress, and as local sheriffs were open only to those worth 1,000 pounds, and the governor's chair was available only to those worth 5,000 pounds. Finally, the convention did not ask Maryland voters to ratify the constitution but issued the document as already in force.

The less affluent agreed to these restrictions because the first state assembly designated as legal tender for all debts the paper money that had already lost a portion of its original value. This eased payment of debts for the poor, and they acquiesced to the state constitution.

Massachusetts

From its inception, Massachusetts was a uniquely religious settlement. The impetus behind the founding of the Massachusetts Bay Company in 1629 was the belief that the Anglican Church of England was corrupt and should be purified. John White, a leading Puritan, secured the royal charter for the company, gaining rights to lands in New England that had earlier been held by the Dorchester Company.

Establishing the Bay Colony

There were 110 original investors in the Massachusetts Bay Company, and John Winthrop, a prominent Puritan, joined their ranks a year later. Some members of the company, under the guidance of Winthrop, moved to gain control of the settlement; they voted to transfer the land patent and government to those who actually settled the colony rather than to all investors. Under these new rules, Winthrop was elected governor.

In the spring of 1630, the Puritans departed for their colony with a fleet of eleven ships, including the *Arabella*, which transported Winthrop to the colony. Over 1,000 passengers and significant amounts of supplies and livestock made the journey. The colonists arrived in New England in June and July and began to build Winthrop's "city upon a hill," a community that would exemplify Christian values.

The colony experienced rapid growth, attracting mostly Puritan settlers, who numbered between 1,000 and 2,000 each year. This rapid expansion encroached on Native American lands, and, in 1637, the Bay Colony's inhabitants found themselves engaged in war with the Pequot. The war resulted in the near extinction of the tribe.

A similar pattern of expansion into Native American lands precipitated the 1675–1676 King Philip's War. The Wampanoag in Plymouth Colony joined with the Narragansett, Pocumtuck, and Nipmuc in Massachusetts, raiding colonial settlements. Because the conflict affected its frontier, Massachusetts joined with Plymouth Colony in its effort to end raids by the natives. In the course of the war, three Massachusetts towns were burned. The white colonists successfully subdued the tribes after chasing them throughout New England, finally capturing and killing the Wampanoag leader Philip in 1676.

Society

The colonists who populated Massachusetts were mostly from the middle and lower ranks of English society, a group composed of yeoman and tenant farmers, as well as skilled artisans. Servants immigrated to Massachusetts, as did a fair number of the gentry. Much of the colony was composed of white settlers; however, Native Americans and African Americans were also members of Massachusetts society.

The first blacks arrived in Massachusetts as early as 1633; by 1680, there were between 100 and 200 black residents in the colony. In 1715, it was home to 2,000 blacks in an overall population of 96,000. Slavery in Massachusetts was low as compared to other colonies, largely due to the lack of a labor-intensive crop that required numerous workers. Massachusetts residents were well aware of the presence of blacks in their community, however, and established extensive laws to govern black residents' behavior.

By the 1770s, when this map was drawn, nearly a century had passed since the termination of the Puritan commonwealth. Religious influences in the Massachusetts Bay Colony had waned in favor of a commercial spirit and thriving trade economy, and the population exceeded 250,000. (Library of Congress, g3760 ar088100)

The colonists placed a great emphasis on the importance of education in the community. In 1636, they established Harvard to provide the necessary education for ministers. Education of children was also of primary importance. In 1647, the General Court adopted legislation that required all towns with 50 or more families to provide for the education of the town's children by supporting a public school. Larger towns, those with 100 families or more, were required to establish more extensive grammar schools that included training in Latin.

This emphasis on education resulted in high literacy rates throughout Massachusetts. A result of this widespread literacy was the establishment of a printing press in Cambridge, begun in 1638. In 1640, the press produced *The Bay Psalm Book*.

Religion

The Puritans worked diligently to build a Christian colony, and there was little room for dissent within the community. In 1635, the Puritans faced a conflict with Roger Williams, the minister at Salem. Williams called for absolute separation of church and state, and he also believed that the Puritans should separate from the Anglican Church. Williams was brought before the General Court and subsequently banished from the colony. Other dissenters faced similar punishments.

In 1636, Anne Hutchinson began holding prayer meetings in her home and claimed that she heard directly from God. John Wheelwright, a Boston minister who supported Hutchinson, publicly challenged the religious and political leadership of the colony. Wheelwright and Hutchinson were both banished in 1637.

Despite the emphasis on religion during its formative years, devotion to the church waned as the colony developed. The second and third generations of Puritan settlers joined the church in far fewer numbers than had their ancestors.

In 1662, several ministers met to discuss the declining church membership. In an effort to bolster shrinking congregations, they voted to extend the Halfway Covenant to churches. This compromise allowed the children of church members to become members in their own right, without presenting evidence of their conversion to the congregation for approval. It was left up to the local churches to decide whether or not they would accept this policy. In this, as in their ability to elect their own clergy and manage their own affairs, church members exercised autonomy.

The accusations of witchcraft at Salem in 1692 are perhaps the best-known religious episode in the colony's history. Samuel Parris, the local minister, was at the center of the fray. His daughter and her friends claimed that they had been attacked by witches and began naming their tormenters. In the ensuing furor, hundreds of people in Salem and nearby towns were accused of being witches.

The hysteria prompted Governor Phips to appoint a special court to try the accused. Twenty villagers were executed, having been convicted of practicing witchcraft. Accusations of witchcraft continued until the General Court disbanded the special court later that year, but the episode left its mark on the colony.

In the wake of the Salem witch trials, and with increasing numbers of non-Puritans and non-church members in the colony, secularism increased through the late seventeenth century. This decline in the importance of religious faith was challenged by a revival movement that began in 1734. Known as the Great Awakening, this increased religious fervor spread from Massachusetts throughout much of colonial North America. Sparked by the preaching of Jonathan Edwards, the revival was fueled by the young English preacher George Whitefield.

The revival meetings that characterized the Great Awakening were marked by boisterous, emotional sermons that elicited equally passionate responses from the congregation. This ardor in worship and repentance contrasted with the traditionally dignified order of services in the Puritan churches. Reactions to the revivals resulted in a split of many congregations. Those who accepted the new religious fervor came to be known as "New Lights," while the traditionalists were referred to as "Old Lights." This breach of church congregations resulted in plural churches in many Massachusetts towns.

Government

The colony's charter provided a framework for the government that included an executive in the form of a governor, a deputy to the governor, a board of advisers known as magistrates, and the members of the company, the freemen. These constituted the colony's General Court. Although initially a select few, in 1632, freemen were defined as all male heads of household who were also church members. In 1634, they began electing town delegates to represent the communities in establishing colonial laws.

The General Court not only set wages and prices on goods but also passed laws requiring church attendance and sumptuary laws intended to maintain the social hierarchy. In 1690, the General Court approved the introduction of paper money; in 1751, it authorized the return to hard money.

In 1685, James II undertook a reorganization of the New England colonies begun by his brother, Charles II. This plan gathered all of the New England colonies under the Dominion of New England and the rule of a royal governor, Edmund Andros. Andros established a central government in Boston and proceeded to exert absolute authority. New taxes were imposed. Town meetings, excepting the annual election of officers, were forbidden. And churches were prohibited from collecting tithes to pay ministers' salaries.

In April 1689, following the news that James II would soon be replaced by William and Mary, Massachusetts citizens formed the Council for the Safety of the People. This ad hoc group overthrew the Dominion leadership and reinstated colonial rule.

Massachusetts continued to operate under the established colonial system until 1691, when King William issued a new charter, consolidating the Bay Colony and Plymouth Colony under the rule of a royal governor. The new charter restored the Massachusetts General Court as a legislative and judicial

body. It also provided for deputies in the legislature's lower house to nominate members of the upper house, known as the Governor's Council. In addition, the Puritan church and Harvard were allowed to remain; the charter, however, instituted an official policy of religious toleration. King William appointed William Phips as the first royal governor. Phips, a Massachusetts resident and Puritan, was a follower of Increase Mather, who led the Boston church.

In the early part of the eighteenth century, Massachusetts maintained a steady rate of growth, a stable economy, and domestic peace. When called upon to support the English efforts against the French in King George's War, however, the colonists responded with little hesitation. In 1745, Massachusetts deployed 4,000 men and successfully captured the French settlement at Louisbourg, a major victory that allowed the British to control access to Canada.

Massachusetts again supported an imperial war in 1754 with the French and Indian War (the counterpart to the Seven Years' War in Europe). The treaty that ended the war in 1763 prohibited westward expansion for the colony. In addition, the superior attitude of the regular British troops offended the volunteer militia companies who fought alongside them. These issues would find expression in Revolutionary Massachusetts in the 1770s.

Economy

The Massachusetts economy developed around agriculture and maritime trade. In addition, shipbuilding and its associated trades served as a mainstay of its economy.

Much of the land was split into family farms that produced crops such as corn and wheat. Agricultural surpluses were shipped primarily to the West Indian colonies of Barbados and St. Kitts. In exchange, Massachusetts imported sugar, tobacco, salt, indigo, cloth, and household goods. Large amounts of the sugar imported to the colony were converted into rum; by 1750, Massachusetts boasted more than sixty distilleries and exported over 2 million gallons of rum.

As families grew and towns expanded, it became harder to obtain land. By the eighteenth century, there was little room for Massachusetts to grow, given its French and Native American neighbors. This lack of opportunity for growth frustrated later generations and further fed the rebellion against England.

Revolutionary Massachusetts

Revolutionary activity in Massachusetts centered on the question of taxation and representation. The first spark of rebellion began with the Stamp Act of 1765. Boston's response was the Braintree Instructions, a listing of the ways in which the act violated the rights of Englishmen. Drafted by John Adams, the Braintree Instructions declared that the taxes imposed would drain cash from the colony and that it violated the principles of the Magna Carta by taxing freemen without their consent. Adams also objected to the enforcement of the tax by a single judge of the Vice-Admiralty Court. This response to the Stamp Act was adopted throughout Massachusetts.

Boston residents also reacted with actions that included vandalizing the home of the royal governor, Thomas Hutchinson. Hutchinson was a native of Massachusetts, but his friendships with English officials, his connections to the Anglican Church, and his wealth all separated him from the colonial activists. He soon became a symbol of all that was wrong with English control of the colony.

Further violence included the 1770 Boston Massacre, in which British troops fired into a mob and killed an 11-year-old boy and several others. This was followed by the Boston Tea Party, Massachusetts's response to the Crown's decision to grant a monopoly on tea imports to the colonies to the nearly bankrupt East India Company. While this decision actually lowered the price that colonists would pay for tea, it was interpreted as another attempt at illegal taxation and a threat to American tea merchants. When ships carrying 45 tons of tea docked at Boston Harbor, a group of radicals known as the Sons of Liberty disguised themselves as Native Americans, marched aboard the ships, and dumped the tea, valued at more than 10,000 pounds, into the harbor.

The destruction of property brought Massachusetts to the forefront of England's response to colonial rebellion. The Crown ordered the Boston ports closed until the tea had been paid for. Other acts, known in Massachusetts as the Coercive Acts, included a nullification of the 1691 Massachusetts charter and a requirement that the colonists quarter British soldiers. The Coercive Acts significantly expanded the power of the royal governor and his appointees, and limited towns to one meeting annually—if it was approved by the governor.

In the summer of 1774, Massachusetts's committees of correspondence framed the colony's reaction to the Coercive Acts. The response urged the governor's appointees to resign their positions, requested citizens to gather in order to prevent courts from sitting, and recommended that town militias be activated and military supplies stockpiled. The first shots of the American Revolution were fired in Massachusetts at Lexington and Concord on April 19, 1775.

At the same time as the colonies declared their independence, Massachusetts residents also sought reforms in their own government. After years of attempts to revise the state constitution, in the spring of 1779, a constitutional convention was held, and Massachusetts voters approved a new government framework in 1780.

The basic form of government, drafted in large part by John Adams, included an upper legislative body known as the Senate, whose members were chosen annually and apportioned according to the local tax districts. Initially, senators were required to own land valued at 300 pounds or more or a combination of personal and real property worth 600 pounds.

Each incorporated town was allotted one delegate in the lower house of the legislature. In order to be eligible for this office, delegates were again required to be property owners, although the requirement was substantially lower than that for the Senate. In addition, the state agreed to pay for one round-trip journey to the legislative session in order to ensure widespread participation. All elected officials served terms of 1 year.

The governor was required to be a Massachusetts freeholder with property valued at 1,000 pounds. As defined, the position of governor was a weak one. The governor's powers were limited to the ability to call and dismiss the legislature, command the state militia, and veto legislation. Massachusetts elected its first governor, John Hancock, under the terms of the new state government, in 1780.

Massachusetts Bay

For most of its human history, the area that became known as the Massachusetts Bay was Native American territory. The native peoples who came to the bay area, following game as glaciers receded, built sophisticated cultures based on its physical characteristics and animal life. English settlement on the bay dates from the early years of the seventeenth century. By the late eighteenth century, Massachusetts Bay was the location of one of colonial America's largest cities.

Although they were mainly Algonquin, the native peoples of southeastern New England spoke a number of distinct languages, many of which were mutually unintelligible. The Massachusett, Wampanoag, and Nauset established semipermanent villages and relied on the rich marine life of the bay for food and other resources. In precolonial times, the bay was home to large numbers of cod, herring, haddock, giant tuna, and swordfish. Closer to shore, clams, scallops, and some oysters could be obtained as well. Generally speaking, deep-sea fishing was a male task, while women, also in charge of agriculture, gathered shellfish.

Just prior to English colonization, particularly between 1616 and 1619, European disease decimated native populations. The Massachusett were hit particularly hard; about nine in ten Massachusett may have died in the epidemics. At the time he encountered the Pilgrims, Wampanoag sachem Massasoit presided over a shattered world.

Forays by Giovanni da Verrazano and Esteban Gómez—the latter a Portuguese mariner in the employ of Spain—along the Massachusetts coast in the 1520s piqued European interest in the region but did not alter native lifeways significantly. The same cannot be said for intensive English efforts at colonization, which began about a century after the earliest European explorations. Beginning with the small band of separatist Pilgrims led by William Bradford that established Plymouth in 1620, English interest in, and immigration to, the land surrounding Massachusetts Bay continued to grow. The Massachusetts Bay Company, a joint-stock trading venture, eventually came to be dominated by Puritans, whose troubles in England seemed more serious every day. The leadership of the company obtained a liberal charter from Charles I, which gave them a great deal of local decision-making power, and they made it even more liberal by removing it to New England.

On the shores of Massachusetts Bay, under the guidance of John Winthrop, the Puritans set about the business of establishing a holy example for the Anglican Church: a "city upon a hill." While the dream of establishing a godly society eluded Puritan leaders, the towns they founded, such as Rockport, Salem, and Boston, grew rapidly. In a period known as the Great Migration, roughly 10,000 Puritans came to the Massachusetts Bay Colony between 1630 and 1640, along with about 10,000 other settlers. Many thousands more followed them as the seventeenth century progressed. Englishmen fished the waters of the bay, and a fledgling shipbuilding industry took hold. In the marshes that grew alongside the bay, cattle grazed, further sustaining the remarkable population explosion.

While seaside towns founded by the English prospered, native communities in the Massachusetts Bay area suffered correspondingly. Native peoples struggled at first to survive as autonomous political entities, but after King Philip's War (1675–1676), as sovereignty vanished, cultural survival and ethnic identity became more important than political independence.

Boston became one of the most important English seaports in the Americas. It counted 3,000 inhabitants by the 1660s; the population approached 20,000 on the eve of the War for Independence. While English capital had financed the earliest shipbuilding and mercantile ventures, Americans operating out of Boston and Salem took over these activities as settlements expanded.

In the 1760s and 1770s, Boston became a hotbed of American Revolutionary activity. Reinvigorated by the global successes of the Seven Years' War (1756–1763), the English Parliament attempted to tighten the reins of its expanded empire, with disastrous effects. The Stamp Act riots of 1765 and the furor over the Townshend Duties brought Bostonians of many different social groups together in protest against what they perceived as new and unfair forms of taxation.

The Sons of Liberty first organized in Boston in the 1760s. Massachusetts Bay itself became a symbol of protest when Revolutionaries, dressed as Mohawks, dumped three ships' cargoes of East India Company tea into Boston Harbor. Following independence, American fishing and shipping operations continued to expand in the region, prompting commercial and industrial growth well into the nineteenth century.

Massachusetts Bay Charter

The Massachusetts Bay Colony emerged from the pretext of a joint-stock trading enterprise called the Massachusetts Bay Company. It gained its legality in 1629 when King Charles I issued the Massachusetts Bay Charter at the behest of a group of Puritan merchants.

The founders of the company selected John Winthrop, a prosperous Puritan lawyer, to lead the endeavor, sending more than 1,000 men, women, and children across the Atlantic in 1630. Since the charter required the Massachusetts Bay Company to maintain a home office in England, Winthrop and the other company leaders decided to take the charter with them to New England, in order to transfer the entire government of the colony to Massachusetts Bay, where they hoped it would ensure local, but more importantly Puritan, control.

Upon arrival in Massachusetts Bay, the founders effectively translated the company charter into a plan for government, a process that took nearly 14 years to complete. By transferring the Massachusetts Bay Company charter to America, an English trading company evolved into a provincial government and initiated a unique project of colonization.

Power within the company rested with the General Court, which was responsible for the election of a governor and his eighteen assistants. The General Court consisted of the shareholders, commonly referred to as freemen, because they had the freedom of the company. Of those who went to America, only a few besides Winthrop and his assistants initially had such status and freedom. While this suited these select few, more than 100 settlers petitioned for freeman status shortly after the colony was established. Rather than risk trouble, the inner group invited applications and finally admitted 118 in 1631. Afterward, provisions were made such that only church members, a limited category, could become freemen.

Originally, the General Court consisted of one house, composed of company members who had the power to pass laws and levy taxes. It acted as the supreme legislative and judicial authority in the colony. In 1634, the colony had grown large enough to make reliance on membership cumbersome, and the composition of the General Court became limited to just two or three representatives from each township. In 1644, the government established by the charter was further altered when the General Court was expanded into a two-house legislature, which set the deputies and assistants to the governor in a separate house from the elected town representatives. With establishment of a bicameral legislature, all legislative decisions required a majority in both houses for passage.

Thus, over an extended period, the Massachusetts Bay Company underwent a metamorphosis that took it from trading corporation to the governing body of a commonwealth. Church membership replaced stock ownership as the criteria for becoming a freeman, later called a voter. The General Court, like Parliament in England, became a representative body composed of two houses: The House of Assistants roughly corresponded to the House of Lords, and the House of Deputies was comparable to the House of Commons. Although the charter remained unchanged, the performance under the charter was entirely different from original expectations.

Massachusetts Bay Colony

The Massachusetts Bay Colony was founded by a group of Puritans in 1630. Puritans had come under increasing religious prejudice in England. Eventually, prominent members of the group dominated the Massachusetts Bay Company, a joint-stock, colonizing venture. In 1629, the company received a liberal charter from King Charles I, just before he dissolved Parliament. In 1630, the company moved its charter, its headquarters, and hundreds of people to the shores of Massachusetts Bay.

John Winthrop was elected governor of the company and colony; he would serve in that capacity for many of the colony's formative years, until his death in 1647. Discontented colonists from the Massachusetts Bay Colony later broke off to form several other New England colonies during the seventeenth century. Thus, the influence of the original colony was widely felt in the northern region of English North America.

Massachusetts Bay under Puritan rule was a strict, moral colony, and many of the colony's leaders believed that God had formed a special covenant with the Puritan community. This sentiment was reinforced by John Winthrop's "Modell of Christian Charity" speech delivered aboard the *Arabella*.

In the new colony, full church membership was restricted, and, initially, only full church members could vote and hold office. It would be a mistake to label this form of government a theocracy, however. While ministers were powerful, they were forbidden from holding office in Massachusetts.

The main unit of government in Massachusetts Bay was the town. Town, congregation, and family were all extremely important to early colonists. The Puritan way did not deal particularly well with dissent, and several colonists, most notably Roger Williams and Anne Hutchinson, ran afoul of the authorities and were banished. Puritans soon came to view Native Americans as agents of the devil and, accordingly, fought the Pequot War (1637–1638) in a strikingly vicious manner.

As the seventeenth century progressed, hard-core Puritans comprised a smaller and smaller portion of the population, and a vigorous merchant class began to assert itself. The Congregational Church was also undergoing changes, exemplified by the Half-way Covenant of 1662, which extended some privileges to people who had not undergone a conversion experience. The economy of the Massachusetts Bay Colony was diverse, but fishing, shipbuilding, and trade were three of the main activities.

The Massachusetts Bay Colony was the chief beneficiary of what has been termed the "Great Migration," in which tens of thousands of Puritans immigrated in a matter of decades. As the Massachusetts Bay Colony expanded westward, it exerted pressures on native communities, and a series of wars, the most devastating being King Philip's (Metacom's) War (1675–1676), which permanently disrupted native life in the region.

In the 1680s, Massachusetts Bay was one of the colonies included in the Dominion of New England. The Dominion was an attempt by James II and others in the English government to exert a new level of control and extract a new level of profit from American colonies. This met fierce opposition in Massachusetts; Dominion government essentially ended when rebels in Boston imprisoned Sir Edmund Andros, the Dominion's governor.

In 1691, the Massachusetts Bay Colony received a new royal charter that gave it control over the former Plymouth Colony, adding many miles of new territory and increasing the population of the larger colony. Massachusetts continued to move farther away from the Puritan ideals upon which it had been founded and closer to the "Yankee" commerce-oriented ethic that would dominate the late eighteenth and nineteenth centuries.

The eighteenth century saw Massachusetts assert itself as a crucial part of England's overseas empire. Throughout the century, Massachusetts was a battleground in the ongoing conflict between the French, the English, and native peoples allied with both groups. In King George's War, Massachusetts forces took the massive French fort at Louisbourg, only to see it returned as part of the peace settlement. In the aftermath of the French and Indian War, Massachusetts became a hotbed of anti-English sentiment and eventually led the movement toward independence.

Massachusetts activists, the Sons of Liberty, led the protests against the 1765 Stamp Act and famously rejected the Tea Act of 1773 by disguising themselves as Mohawks and dumping British tea into the harbor. It is not surprising that Massachusetts was an early advocate of independence. In 1775, fighting broke out between British and Massachusetts forces at Lexington and Concord, signaling the beginning of the American Revolution.

Massasoit (d. 1661)

Massasoit was considered one of the great sachems (chiefs) of the seventeenth century. A Wampanoag leader, he allied himself with the settlers in Plymouth upon their arrival in 1620. Throughout his life, he fought with the English settlers against other native tribes, thus affording protection not only for his own people but also for the fledgling settlers. Along with other great chiefs of the time, however, he resisted the missionary attempts at converting the Native Americans and saw those attempts as threats to his people's survival.

Plymouth, different from most other colonies, often paid the Native Americans for the land taken from them. This unique breed of colonists ordinarily settled around Native American villages, because the native peoples had invited them. This commonsensical approach to the indigenous population lessened encroachment on the colonists by other tribes or Europeans wanting to settle in the same area. In this friendly atmosphere, it is not surprising that Massasoit signed a nonaggression treaty with the Pilgrims, which he honored until his death.

Much legend surrounds the events that preceded the treaty between Massasoit and the Pilgrims, including the part played by Squanto, the Native American translator and liaison with the Pilgrims. The true extent of the part he played in the story of their initial survival—that is, the legend, in which the friendly, ever helpful native taught the settlers how to raise corn and provided them with much-needed food—is uncertain. Squanto's importance to the Pilgrims may indeed have been somewhat exaggerated, however, as he was serving as an agent of Massasoit.

The Pilgrims were a quick study when it came to the native peoples' agricultural practices, and their first harvest, in 1621, was bountiful. While it may be true that there was a celebration of that harvest—a feast to which Massasoit and other Wampanoags were invited—as well as a ceremony, historians note that the simple celebration has been given religious overtones that were not apparent at the original event. It is true that the foods present, including pumpkins, turkeys, corn, and squash, were indigenous to the Americas and were surely provided by the local tribe or at the very least grown with their aid.

In any case, the event itself proved to be premature, as the harvest was good but not sufficient to support the addition of the thirty-five new settlers who arrived in November 1621. Once again, short rations forced the Pilgrims to rely on the generosity of Massasoit for the food they needed to survive.

Massasoit, "great Sachem of the Wampanoags, Protector and Preserver of the Pilgrims, 1621," is memorialized in a statue that overlooks the harbor in Plymouth where the Pilgrims landed. (Library of Congress, LC-D419-14 DLC)

Massasoit died in 1661, but his legacy continued as his sons, Wamsutta and Metacom (who also was known as King Philip), presided over the Wampanoag and continued to honor the treaty Massasoit had signed with the colonists. This was not an easy task, as the tribe's position was rapidly deteriorating.

A period of resentment toward white authority began when Wamsutta died under suspicious circumstances while he was being questioned by Plymouth authorities about a possible uprising. Conflict and increasing tension between the colonists and the Native Americans finally led to Metacom's declaring an all-out war on the Plymouth Colony in 1675. Decades of peaceful relations, as well as a long-honored coalition, came to an end.

Mather, Cotton (1663–1728)

Cotton Mather was one of the most influential Puritan clergymen and perhaps the most controversial public figure of his day.

The oldest of twelve children, Cotton Mather was born in Boston in 1663. Bostonians of the day likely saw him as the heir apparent to a colonial dynasty: Mather's grandfathers were the illustrious Puritans Richard Mather and John Cotton, both of whom had been instrumental in the founding of the Massachusetts Bay Colony, and his father was Increase Mather, a Boston minister and the first president of Harvard College.

Tutored in classical languages and Hebrew as a child, Mather entered Harvard at the age of 12. His youth and his family's prominence made him an easy mark for older students, and their teasing left him miserable. In addition, a stutter made the ministry seem out of reach. In his early days at Harvard, then, Mather began to study science and medicine.

As the young man's stutter disappeared over time, he returned to study for the ministry, although he remained actively interested in medical and other science throughout his life. Perhaps this fascination was reinforced by his misfortune in marriage and family life: His first two wives died at relatively young ages, and his third wife became insane; only two of his fifteen children lived longer than Mather himself.

Public Life and Controversies

Following his graduation from Harvard with a master's degree in 1681, Cotton Mather served as an assistant to his father at Boston's Old North Church for the next forty years. While Mather was known to be an eager and industrious minister, often writing as many as five sermons each week, he is more widely remembered for his participation in and commentaries on various political activities of his day and for his writings.

Mather entered the ministry at a time of changing attitudes toward Puritan teachings. As early as the 1630s, rigid Puritanism had come under attack from some merchants who found its reliance on strict interpretations of Old Testament pronouncements concerning commerce to be too restrictive. Adhering to the letter of the Pentateuch was increasingly seen as damaging to New World business and trade with England. By the time the Massachusetts Bay Colony had its charter revoked in 1684 and then restored in 1691, the merchants had allied their interests into a formidable bloc of power.

The new colonial charter contained two drastic changes from earlier Puritan rule: First, the voting franchise was now based on property ownership rather than on church membership. Second, religious toleration was imposed, in contrast to the former Puritan habit of charging "heresy" against anyone who questioned ecclesiastical authority or preaching or who failed to observe any of the myriad laws and restrictions imposed by the hierarchy. Against this backdrop of greater religious freedom, Increase and Cotton Mather came to their own prominence in Boston church life.

Cotton Mather was not well suited to these changing times. In his youth and early ministry, Mather was one of those who strove to strengthen Puritan faith

and practice in the colonies. At the same time, beginning early in his career and continuing throughout his life, Mather carried on correspondence on religious, scientific, and other topics with various church leaders, scientists, physicians, and other professionals from around the world. Although he never left his native New England, Mather was probably exposed to more ideas and points of view than virtually any other leading member of colonial society. His native intelligence, coupled with his continual exposure to new ideas, made him somewhat open to the growing spirit of ecumenism as new immigrants from different lands came to the New World. But he remained firmly convinced that the Puritan theocracy he had grown up with was the only way in which God's kingdom could exist in America, and he was in the forefront of those calling for Puritanism's reinforcement and renewal, not its demise.

Such an attitude set Cotton Mather at odds with many of his contemporaries. Further exacerbating this conflict was Mather's personality. As a child of family and privilege, Mather early became convinced of his own special status within New England life. By most accounts (including his own words among his voluminous writings), Mather was self-centered, arrogant, and spoiled. Such traits may be found in many men of brilliance, but they are usually tempered by a willingness to engage in dialogue with those holding other opinions or positions within society; Mather evidenced no such willingness. True to his Puritan roots, he seems to have been convinced that there was only one legitimate worldview, one that held Mather himself at the center, with the success or failure of God's plan for His people in the New World resting squarely upon the shoulders of Cotton Mather. Mather's personality was such that he almost never entertained ideas other than his own, and his dismissal of others was rarely tactful. If someone disagreed with his Puritan vision, that person was dismissed out of hand as being an instrument of Satan.

Cotton Mather was renowned as a man of letters and science, as well as a Puritan minister. He produced more than 400 published works, the most celebrated of which is Magnalia Christi Americana (1702), an ecclesiastical history of New England. (Brown Brothers, Sterling, Pennsylvania)

Not surprisingly, these personal traits of arrogance and egocentricity were damaging to Mather as a pastor and as an influential leader in the community. Unlike Mather, other prominent ministers who emerged from colonial New England were able to mix compassion and empathy with their brilliance and were accessible to and beloved by their congregations. In contrast, Mather felt himself to be far above fraternizing with his flock; in fact, many of his diary entries refer to his parishioners in such extremely derogatory terms as "insignificant lice," "silly people," and "foolish." In part, Mather's arrogance can be attributed to his belief in the Puritan tradition that New England's highest privilege was to be ruled by the godly, among whom he considered himself. But his inability to recognize that times were changing and that changes were required on his part if he were to earn a position of influence in the new culture resulted in his failure to be the religious or civic leader he had hoped to be.

Literary Works

Cotton Mather was undoubtedly the most widely read man in America in his day. At a time when an established colonial minister's library might respectably contain fewer than 30 volumes, Mather's consisted of over 3,000 books. During his lifetime, he himself produced over 400 published works, although many of these were short, cheap volumes, which often took advantage of public interest in some current community event (for example, an execution of a criminal might prompt Mather to publish an essay warning against sin). His topics ranged from folklore to science to his primary concern, theology. An examination of Mather's works reveals that though he had a gift for the craft of writing and studied many new ideas his philosophical rigidity left him lacking in the willingness to reconsider his worldviews. Of all his writings, two stand out as being particularly worthy of comment.

Wonders of the Invisible World (1693) addressed the widespread interest in and fear of witchcraft of the day. It recounts the events of the Salem witch trials of the previous year as Cotton Mather and his father Increase had been present at those trials. Both Mathers had been among those calling for severe prosecution of the accused witches, although to their credit, as the trials continued and the hysteria escalated, both came to urge caution and to denounce the reliance on "spectral evidence" (tales of ghosts and evil spirits inhabiting those accused of being witches) that formed the basis of many

convictions. *Wonders* also gives an account of a variety of old wives' tales, superstitions, and other mystical happenings in the colonies. Such stories were widely circulated and fed into most colonists' fears of evil lurking within the New England forests and wilderness.

The massive *Magnalia Christi Americana* (1702) combines history and biography to tell the stories of eminent colonial personages. While it sometimes slips into extremes of praise, this useful work does provide factual information about many of the leading men and founders of colonial America. Its running theme is one that would come to be repeated often through American history: Even men from humble beginnings could undertake the Lord's work and, by careful dedication to godly works, rise to prominence in the New World.

Mather, Increase (1639–1723)

Increase Mather was a highly visible figure in colonial Boston. The son of influential Puritan minister Richard Mather and the father of Cotton Mather, Increase Mather had a considerable influence on New England culture as a Congregational minister, author, and ambassador. Mather's view of himself as the heir of the founders of New England is evident in his legacy of pursuing orthodoxy. Yet his was an orthodoxy tempered by a pragmatism developed in response to the changing times in which he lived.

By the turn of the eighteenth century, Boston's church leadership was largely in the hands of Increase Mather and his son Cotton. Increase Mather had assumed the pastorate of Dorchester Church from his father Richard. In 1664, he began a fifty-year tenure as the pastor of Boston's Second, or Old North, Church. The following year, he was named president of Harvard College, a position he would hold until 1701, when he was ousted in conjunction with the rise of a new merchant class within New England church life.

A true Congregationalist, Increase Mather opposed the formation of ministerial alliances and associations, believing that such groups would serve only to reduce the traditional independence of each individual church. Likewise, as an orthodox Puritan, Mather was a longtime opponent of Solomon Stoddard and others who favored a policy of open communion, arguing that the practice eroded the foundation of the church. Still, for all his orthodoxy, Mather was something of a pragmatist. For example, although he originally opposed the Halfway Covenant—allowing for the baptism into the faith of the children of parents who had not undergone the full conversion experience in adulthood—he eventually reversed his opinion, publishing his ideas in *The First Principles of New England* in 1675.

Like many of his contemporaries, Increase Mather published a number of tracts, pamphlets, and other pieces. His religious texts included sermons, devotional pieces, ecclesiastical treatises, and various works discussing and defending church polity. He also published several records of New England history, including accounts of the Native American wars. Among his most influential writings were those that reflected the combined political and religious aspects of New England culture. Probably Mather's most important published work addressed the intersection of politics and religion in the Salem witch trials of 1692.

Like most New Englanders and virtually all of his colleagues in the clergy of his day, Increase Mather was a firm believer in the dangers of witchcraft. As a leader of the Massachusetts Bay Colony, he was heavily involved in the trials resulting from the widespread hysteria attending reported supernatural activity in Salem, Massachusetts, in 1692. Unlike many of his contemporaries, however, Mather and his son Cotton became increasingly troubled as the prosecution, punishment, and public opinion grew more violent. As a consequence of his belief that the court was acting improperly, Increase Mather worked both publicly and behind the scenes to bring the trials to an end. His *Cases of Conscience Concerning Evil Spirits* (1692) was a record of his observations on the American experience with witchcraft.

Mather's reputation for moderation, as well as his leadership within colonial life, led to his involvement in a more overtly political capacity. In 1684, the charter of the Massachusetts Bay Colony was revoked by the Crown. Increase Mather was appointed as an ambassador to the royal court and sent to London in 1688 to negotiate a new charter with the Catholic king James II. As part of the negotiations that continued into the reign of William III, the appointment of a royal governor was decreed, and William Phips, the candidate favored by Mather, was appointed to the post. By 1691, a new charter was granted to the Massachusetts Bay Colony, although it differed materially from the original charter. In addition to its provision for a royal governor, the new charter based the franchise on property ownership rather than church membership.

Despite his pragmatism and his recognition that times were changing, Increase Mather retained a deep sense of loyalty to the basic Puritan orthodoxy of

his forefathers. He was particularly distressed with the changes he saw taking place at Harvard College as that institution's ecclesiastical mission shifted, in part, in response to the rising merchant culture. As a result, he and others founded Yale College in 1701 in the hope that this new institution would become the home of orthodoxy that Harvard once had been.

Maya

Long before European conquest, the Maya had built one of the great Native American civilizations. The Maya people lived in what is now southern Mexico, Guatemala, Honduras, and Belize. No single Maya city-state dominated the entire region. Rather, each one had its own capital and surrounding, subject towns. Warfare and trade caused the power of various Maya city-states to expand and contract over time. The history of the Maya can be divided into three periods: preclassic (2000 b.c.e.–200 c.e.), classic (200–900), and postclassic (900–1540).

The early Maya practiced slash-and-burn agriculture. While this method produced high yields initially, it quickly exhausted the soil and forced the Maya to move to new fields. By the classic period, the inhabitants of growing Maya cities demanded more food. This led to the development of techniques to increase agricultural production. For example, the Maya drained swamps and riverbanks to create elevated fields near cities. They also built irrigation canals and reservoirs when needed. At other times, they constructed terraces on mountainsides for farming.

El Caracol, the tenth-century Mayan observatory at Chichén Itzá in Mexico's Yucatán Peninsula, testifies to the sophistication of that civilization long before European contact. The Spanish did not take control of the Yucatán until the 1540s. (Chichén Itzá, Yucatán State, Mexico/Bridgeman Art Library)

Improved agricultural techniques allowed the Maya to develop large cities. During the classic period in particular, significant urbanization occurred. The largest Mayan cities had more than 50,000 inhabitants. Each served as a political and religious center for the surrounding countryside. Examples of monumental architecture could be found in these cities, where large pyramids often served as sites for the many Mayan rituals and ceremonies. Limited

technology meant that construction of these monuments required the mobilization of thousands of workers.

Among the largest cities was Tikal, located in the Petén jungle of present-day Guatemala. Tikal, established at least as early as 292 c.e., was one of the earliest settled Maya sites. The city possessed six great pyramids, including the tallest Maya structure (known to archaeologists simply as “Temple 4”), which was 230 feet high. Tikal also had reservoirs, artificial lakes, palaces, and ball courts.

Mayan society was divided between nobles, a middle class, and commoners. The members of the elite nobility served as political rulers and religious leaders, positions that were closely intertwined. Merchants and artisans comprised a middle group. Some merchants grew wealthy from long-distance trade; urban artisans made luxury items such as jewelry, ceramics, and other handcrafted products. Commoners worked mainly in agriculture, cultivating their own lands, as well as those of the elite. They produced crops such as corn, beans, and other vegetables to sustain Mayan society. There was one more class below the commoners—that of the slaves, which was generally made up of war captives and criminals.

The Maya made many important advances in learning and culture. They developed a complex calendar system, including a 365-day calendar, as well as a 260-day ceremonial calendar. They made key contributions in mathematics and astronomy and understood the concept of zero and place value.

The Maya also had written literature, using a form of hieroglyphics, although only four pictorial manuscripts have survived. The Maya also inscribed pillars, facades, and stairways, where they often recorded historical events. The importance of writing among the Maya placed scribes near the top of society.

Europeans succeeded in conquering the Maya, as they did other indigenous groups in the New World. The conquest of the Maya was different from other conquests, however, in that the Spanish had to subjugate each region one by one, causing the process to take nearly 200 years in some areas. By the late 1520s, the Spaniards had conquered Chiapas in southern Mexico, but it took them several campaigns and twenty years to conquer Mexico's Yucatán Peninsula. Spaniards arrived in Guatemala in 1524, fighting with the Quiche Maya and then conquering other Maya groups there. The longest holdout was the Petén area and its dense forests. Many Maya from other regions fled there to escape Spanish conquest.

After the Spanish conquest, the Maya did not always readily accept Spanish rule. The most significant Maya uprising against the Spanish came in 1712 with a widespread revolt in Chiapas known as the Tzeltal Maya Rebellion. The root cause of the rebellion, which included both Tzeltal and Tzotzil Maya, was religion. Traditional religious beliefs persisted in the region, which alarmed the Spanish Catholic religious officials. The Spanish sought to end native religious practices, and a dispute developed over the recognition of Native American sightings of the Virgin Mary.

In 1712, thirty-two Mayan towns revolted, declaring Spanish authority void and creating their own indigenous priesthood and civil hierarchy. The next year, however, the Spanish put down the Mayan revolt. While the Mayan people survived, and continued to survive, as an ethnic group with their own language and customs, the existence of an independent Mayan political entity ceased.

Mayflower Compact

A small separatist group of people in England, known as Pilgrims, were persecuted because of their religious beliefs. Some of them sought relief by emigrating to Leyden, Holland, but they became concerned about liberal attitudes there leading some of their children to loosen their ties to the church. Therefore, they decided to relocate to the New World, where they hoped to be able to practice their faith freely.

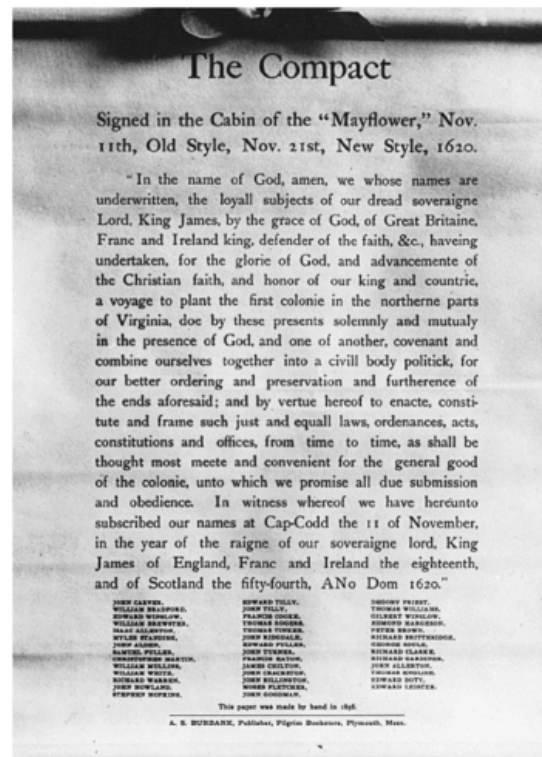

After a difficult Atlantic crossing on the ship *Mayflower*, the Pilgrims were faced with a different challenge: There would be no civil authority on land for them to answer to. Many passengers had hired themselves out as indentured servants, promising to work for seven years to pay for their passage, and some thought that, since they were outside the bounds of English law, they could assume their freedom as soon as they landed.

In response, the leaders of the Pilgrim group created what became known as the Mayflower Compact, a document designed to be their rule and guide to life and living in the New World. The Mayflower Compact became the official constitution of Plymouth Colony, lasting until Plymouth merged into the Massachusetts Bay Colony in 1692. The first American state paper, it provides the original statement of the principles of American democracy as we now know and understand them. For the first time in world history, a group of men of their own free will agreed to be governed by themselves according to the will of the majority.

The Compact expresses four major themes: a deep faith and belief in God and His divine guidance; a deep loyalty to England and the king, even though its signers had been persecuted and exiled in their homeland; a mutual regard for one another as equals in the sight of God; and an intent to establish just and equal laws upon which would be built a truly democratic form of government.

The Pilgrims believed in God, and, believing in God, they believed in the equality of all men before God. Therefore, without precedent, they made all men equal before the law. Here then is the birth of popular constitutional liberty, foreshadowing the Declaration of Independence, the Bill of Rights, and the Constitution.

The Mayflower signers were very careful to recognize King James I as their lawful sovereign. Although the King of England was also the head of the church, they had come to the conviction that religion was a matter of individual conscience and belief, having made that logical step from the search for religious freedom to the discovery of political freedom.

The Mayflower Compact, signed by forty-one male passengers on November 1, 1620, was a statement of democratic principles that served as the official constitution of Plymouth Colony. Although copies survive, the original document has never been found. (Brown Brothers, Sterling, Pennsylvania)

In time, the Pilgrims' democratic ideals spread to other colonies. Their example gradually softened the restrictive and intolerant government of the Massachusetts Bay Colony. By the time the more free and tolerant Plymouth Colony was absorbed into the Massachusetts Bay Colony, the latter was ready to open privileges to all.

The Compact was an agreement signed by all the men on board, including the indentured servants, promising to abide by laws that would be drawn up and agreed upon by all male members of the community. Women were not allowed to participate in the governing process.

The Mayflower passengers were not men of wealth and position, nor were they a homogenous group, coming, as they did, from various walks of life and religious backgrounds. Many of them were strangers to the Leyden flock, and less than half were members of the Church of Leyden. Differences of opinion would certainly occur, and dissensions were bound to arise. But there was no one to whom they could appeal. Wise leadership proposed a document that would bind them all to submit to "such a government and governors as we should by common consent agree to make and choose."

As soon as the document was completed, the entire company was called together to hear it read aloud. Once the Compact was signed, those who signed it became legal voters and proceeded to elect a governor. Their choice was John Carver, America's first democratically elected leader.

Menéndez de Avilés, Pedro (1519–1574)

Pedro Menéndez de Avilés was born in Asturia, Spain, in 1519, the same year in which Hernando Cortéz began his conquest of the Aztecs in Mexico's central valley. Menéndez was a poor nobleman, which probably influenced his decision to leave Spain to seek wealth in the New World. Little is known of Menéndez's early career, but he served the Holy Roman Emperor Charles V admirably against the French in the Bay of Biscay. Menéndez's area of expertise was naval conflict, and he also earned membership in the prestigious Order of Santiago.

After dealing with accusations of smuggling in 1563, Menéndez was contracted by Philip II in 1565 to discover and settle North America in his name. Menéndez would receive the titles of governor, captain general, and *adelantado*, and, if he fulfilled the terms of the contract (including the founding of two cities), he would receive land and the title of marquis. In theory, the area under the control of Menéndez stretched from present-day Canada to Mexico, though in practice, it was much smaller.

Because of their success in extracting wealth in Mexico and Peru, the Spanish did not focus their attention on colonizing in the present-day United States. Spain's great treasure fleets did, however, attract the attention of English and French sea captains, and Menéndez's colony in Florida would protect shipping lanes. In addition, Menéndez had the general authority to convert the region's Native Americans and attack any Europeans who might encroach on the Spanish claim. The first European threats were the French forts Charlesfort (built on Port Royal Sound in 1562) and Caroline (established on the St. Johns River in 1564). It bears mentioning that both of these were Huguenot (French Protestant) enterprises.

Traditionally, scholars have asserted that the Spanish came to North America to plunder, the French came to trade, and the English came to settle. In the case of Florida, as elsewhere, these distinctions are too simple, and they do not convey the reality of the colonial situation. Menéndez had an expansive, visionary plan for Spanish Florida. It would include agriculture, livestock, fishing, naval stores, and shipbuilding industries.

In the summer of 1565, Spanish and French fleets raced across the Atlantic to shore up their defenses in Florida. The French under Jean Ribaut reached Florida first, but their small colony provided little resistance against the larger Spanish undertaking. Menéndez sailed from Cadiz with eleven ships and over 1,000 men. Though he was delayed, and the size of his fleet was diminished, by severe weather, he managed to reach St. Augustine in September. After a brief naval battle near Fort Caroline, Menéndez sailed south, where he founded St. Augustine, the first permanent European settlement in what is now the United States. Local Timucuan, under the guidance of Seloy, provided materials and manpower to build a Spanish fort.

The Spanish seaman Pedro Menéndez de Avilés was commissioned by King Philip II to establish a colony in Florida, where he landed in 1565 and founded the settlement of St. Augustine. (Brown Brothers, Sterling, Pennsylvania)

When a storm weakened the French fleet, Menéndez took the opportunity to attack Fort Caroline. The assault was a total surprise to the French, whose forces were divided and ill. Menéndez captured the fort and renamed it San Mateo, executing most of its defenders. Between 150 and 300 Frenchmen had been shipwrecked away from Caroline, and Menéndez caught them south of St. Augustine. The French offered to give up their weapons in exchange for their lives, to which Menéndez replied that if they did so, "I should deal with them as Our Lord should command me." The surrendering French troops were executed. Though this was not in keeping with the European code of warfare, Menéndez viewed it as necessary to keep Native Americans and the French Protestants—whom Menéndez thought shared similarly satanic beliefs—from allying against the Spanish.

Pedro Menéndez de Avilés envisioned a transcontinental Spanish American empire. At the time of his death due to typhus in 1574, Spanish Florida was but a weak outpost that remained on the periphery of the Spanish Empire.

In the years following, the English under Sir Francis Drake would destroy the town of St. Augustine, though not its fort, the massive, stonewalled Castillo San Marcos. Spanish Florida would continue to spark Native American uprisings and lose money for the Crown in the decades to come.

Mercantilism

Mercantilism was the dominant economic theory of the colonial era. Most early mercantilists assumed that the basis for national wealth was bullion, a finite resource, and that nations competed to gain bullion at their rivals' expense. Mercantilism assumed an activist government and a self-sufficient country.

British mercantilism was defined by Thomas Mun of the British East India Company in the 1620s. Mun agreed with the general notion that the mercantile nation should develop domestic or colonial sources for all of its needs—agricultural products, raw materials, and finished goods. It needed a strong merchant marine, preferably armed, to control colonial trade.

For orthodox thinkers, trade meant especially the bullion trade for mercantilist nations fortunate enough to have gold and silver mines. Previously, British mercantilism had entailed a significant amount of state-sponsored piracy. Mun eased the pressure to acquire hard metal by pointing out that, for those without direct access to bullion, a favorable balance of trade was a means of acquiring the wealth of other mercantilists. Mun argued that bullion outflows could be beneficial if they resulted in favorable trade balances. This approach reduced but did not eliminate the fixation with bullion as the basis of national economic health.

Control of trade predated mercantilism. In medieval Europe, local governments assessed tolls or tariffs on goods entering or leaving their areas of control. Under mercantilism, the internal trade barriers between different parts of a country gave way to centralized government and international trade controls.

The major mercantilist powers were England, France, Holland, and Spain. All attempted to restrict colonial trade to the home country. These nations wanted colonies that could provide materials and products needed in the home country. In return, they wanted colonies that needed products made in the home country, as well as colonies that operated at a deficit.

Colonies received subsidies for production of raw materials, while restrictions and penalties were placed on manufactures that competed with the home country. Manufacture of these products for local use was acceptable, unless it interfered with the market for European imports. Colonial trade with other European nations was permissible when it brought advantage to the home country, in the form of bullion or a favorable trade balance.

Navigation Acts

Control of colonial trade came through the Navigation Acts. These acts, effective mostly during the seventeenth and eighteenth centuries, restricted imports and exports to intra-colonial shipping. This approach promoted a larger merchant marine, and the sale of shipping services enhanced the balance of trade.

These British acts required that ships have crews made up of three-fourths British citizens or colonists. The Navigation Acts also itemized or enumerated products that had to pass through British ports to the benefit of British reshippers and the British government, which had an easier time collecting import duties. While, on balance, British interests were served by the acts, they also could be mutually beneficial. While controlling England's sources of grain, salt, and other items, tariff walls kept European competition from harming nascent colonial ventures—tobacco for Europe and iron for colonial use, for instance. And subsidies from England were always a possibility for the colonials.

British legislation could hurt the colonies, as in the case of the Corn Laws of 1666, which banned colonial grain shipments. As British law had banned colonial manufacture, these prohibitions effectively ended the New York woolen and linen industries, which had supplied about three-fourths of the colony's needs, in the late seventeenth century. Northern manufacture of hats and iron also struggled against British restrictions.

Colonies benefited because the Navigation Acts restricted foreign competition. New England was able to establish a shipbuilding industry. South Carolina got indigo subsidies. North Carolina got subsidies for ship's stores—pitch, tar, turpentine, and lumber. American goods were competitive in Britain because British tariffs increased the prices of comparable French and other European goods.

Of course, all these tariffs meant that British and colonial consumers had to pay more than they would have otherwise for British goods and other goods transshipped through Britain. This cost the South more than New England or the Middle colonies. Unfinished products from the South were monopolized by England, and the finished goods it needed had to pass through British ports. New Englanders had Caribbean markets, legal or not, and they had little compunction about smuggling.

New Englanders really had objected to the Molasses Act of 1733, which increased duties on French West Indian sugar and molasses, protecting British Caribbean sugar interests. The French Caribbean was New Englanders' outlet for lumber, livestock, flour, and fish in the aftermath of the Corn Laws. The colonists would have been more irate if British authorities had enforced the laws, but again enforcement was lax.

Enforcement

Britain's colonial enforcer was the Board of Trade and Plantations, established only in 1696. The board was noted for lax enforcement, and its principle contribution to colonial affairs was to promote lawbreaking, contempt for officialdom, and occasional connivance of customs officials, maybe even an occasional governor, with the lawbreakers. The Admiralty Courts established to increase adherence to the laws were no better; local juries were reluctant to convict their neighbors of offenses they engaged in themselves.

Until the end of the French and Indian War (known as the Seven Years' War in Europe), the controls were tolerable, because they were not enforced. When the British government attempted to recover the costs of the war, however, friction ensued. Prior to the war, colonials had a lighter tax burden than residents of England. The English thought that the colonials should pay a fair share of the war debt, as well as the new costs of administering the enlarged empire. Parliament began enforcing the old acts and imposing new ones.

The acts were sound from a mercantilist perspective, providing for the well-being of the mother country and compensating for colonies that might prove a drain on the home government. The Sugar Act of 1764 attempted to protect the struggling sugar economy of the British West Indies by taxing foreign sugar and molasses (highly important to New England). The Currency Act of 1764 limited the power of the colonies to issue paper money. The Stamp Act of 1765 was simply for revenue, requiring a stamp on legal documents.

Other objectionable acts of the period were the Quartering Act of 1765, the Townshend Acts of 1767, and the Tea Act of 1773. Colonists also objected to the Quebec Act of 1774, which attempted to control the frontier and cut costs. Its actual effect was to disturb colonials who wanted to settle on Native American and old French lands, as well as compete in the area set aside for the Hudson's Bay Company.

The new laws gave the Middle colonies and New England a better appreciation of older Southern grievances about the burdens of mercantilist policies. Boycotts and other resistance became popular. When resistance led to repeal of the Townshend and Stamp Acts, colonists learned that stubbornness worked. The British, on the other hand, decided that a stronger colonial administration, with troops to back it, might be in order.

On the financial side, mercantilism worked nicely. Trade in 1772 was three times what it was in 1702. Shipping in 1788 was over a million tons. On the eve of the American Revolution in 1776, only one-third of British trade was within Europe; in 1700, the reverse had been true. The West Indian trade mushroomed as well, with a fivefold increase in exports and a fourfold increase in imports.

In 1759, New England's balance of trade was a negative 561,000 pounds. Obviously, New Englanders could not afford to sustain such deficits for any length of time. Many were compensating off the books by means of the timeworn custom of smuggling. But overall British mercantilism seemed to bear out Mun's deemphasis of bullionism.

Mercantilism and the Revolution

Although the colonies became increasingly lucrative over time, the British government still maintained a focus on European affairs. Mercantilism was, after all, a system wherein European governments competed with one another. Colonies were secondary—merely additional resources to be counted in the competition.

Mercantilists failed to realize that colonies could have interests, too. This European focus led to salutary neglect, which allowed the colonies to develop their own economies and interests. When Britain finally turned its focus back to its colonies, because it wanted to exploit them again, through enforcing the navigation acts and levying new charges, colonial interest had already diverged.

Merchants

Merchants in the colonial era provided a variety of services that were crucial to the economic well-being of the American colonies. To obtain goods, they operated ships that occasionally participated in smuggling and privateering. With cash in short supply, they commonly bartered for goods and traded everything imaginable. As the primary source of financing in small communities, they also offered credit. In times of war, they supplied the troops with all the necessities. Although merchants played a part in nearly every economic transaction, they were still a minority in an American population that remained overwhelmingly rural throughout the colonial era.

Merchants received a slow start in the Americas partly because of the religious background of many of the New England colonists. The Puritans regarded trade as a morally dangerous field of endeavor. Rather than take advantage of his economic position and seek the most money that he could obtain for a product, the Puritan merchant was expected to be content with merely a just price for his merchandise. A shopkeeper who pursued unseemly profits ran the risk not only of antagonizing his neighbors but also of being brought before a Puritan court of law. By the late seventeenth century, religious beliefs had weakened; at the same time, a capitalist spirit and merchant class developed.

Early Merchants

The first merchants who appeared did so in port cities as elements of the triangle trade. Largely a private endeavor, this began with manufactured items from Europe that were sent to Africa for the purchase of slaves. The slaves were transported to the Americas, in the infamous “Middle Passage,” to be exchanged for the products of slave-operated plantations. These cash crops, such as indigo or tobacco, were then transported to Europe to complete the triangle. Northern merchants participated heavily in the triangular trade, while Southern merchants more often carried on direct trade with England.

Another variation on this trade in New England involved merchants who sent rum to Africa to buy slaves, who were sold for molasses in the West Indies. The molasses would be transformed into rum in New England distilleries. The process would then repeat. The various forms of triangle trade eventually involved everything that could be profitably traded, including indentured servants.

Most merchants did not engage directly in the triangle trade. Only a very few, such as Thomas Hancock of Boston, were wealthy export-import traders in large cities. Many more merchants were small storekeepers, who engaged in a range of transactions, including serving as intermediaries between the large merchants in the cities and the smaller ones in the remote areas.

In the North, the key to prosperity was trade, because the soil did not support cash crops such as tobacco, and merchants accordingly focused entirely on merchandising. In the South, particularly in the Chesapeake region, the owners of large plantations typically operated stores for the benefit of the surrounding growers. These large planters often carried a hundred or more debtors on their books.

Merchants in remote areas or on the Western frontier frequently also farmed a small plot of land to help make ends meet. Such men were usually the only source of goods from the outside world, apart from the rarely seen traveling peddler. These storekeepers provided an essential service for an area by accepting crop surpluses from neighboring farmers in exchange for the few manufactured goods that a rural family required but could not produce. They were also the only cash buyers of farm surplus and the only source of credit.

Most of the articles sold by merchants throughout the colonies were items used in the production of clothing—textiles, buttons, sewing needles, and so on—and farm equipment. These merchants also dealt in basic household items, and their wares included weapons, tools, kitchen implements, and the like.

Merchants typically operated their stores as sole proprietorships. The shortage of skilled labor meant that a merchant would perform every task in the store. Larger merchants might have an apprentice or two to sweep the floors and tend the fire. They also might have an assistant to tend the books and assist the occasional customer. Even the large stores did not see an abundance of activity. A busy merchant like Thomas Hancock might have twelve transactions on a typical day. In this preindustrial era, many merchants closed the store after lunch and did not reopen until the next day.

In time, colonial merchants presided over a stream of commerce that ran from the farms of the trans-Appalachian west across the Atlantic seaboard to England and Europe and often to Latin America and the islands of the Caribbean. As the colonies grew, demand for goods also increased. To meet the increasing American appetite, some merchants, particularly in New England, gradually were drawn into illegal trade and pirating.

New England merchants typically owned a share in a ship to divide the risks of transporting merchandise across the Atlantic and to the Caribbean. Since they served markets outside of the British Empire, these ships had more opportunity to sneak into a French or Spanish port to pick up goods in violation of British mercantile policy.

Pirating also offered an appealing way of acquiring goods. In addition, the British licensed private ships to prey on ships that traded with the enemy, a practice known as privateering. These privateers attacked French and American ships, usually in Caribbean waters. By 1759, forty-eight privateers had been commissioned in New York alone.

Merchants conducted overseas trade with the help of foreign merchants, who acted as agents for American exporters. The agents accepted goods on consignment, often items sold on a commission basis by the American merchant, and disposed of the products when the best price could be obtained in the local market. The agent then remitted the proceeds of the sale, after deducting his own commission, in either bills of exchange or return cargo.

The primitive transportation system of the colonies made the cost of many products prohibitively expensive. In an age when ships sailed only as fast as the wind blew, it took a month or more—and much money—to ship goods from England to America. The lack of roads in the Americas also meant that shipping goods from a port city to the frontier could take six weeks, adding an additional cost. Freightage might add as much as 20 percent to the original cost of an item.

The prices that merchants charged varied with the terms of individual transactions. The lowest prices were offered for cash sales. On credit sales, markups might reach 100 to 200 percent above the merchant's cost, depending upon the length of credit offered.

Customers routinely expected credit for their purchases. Terms of six months to one year were common, and longer periods were negotiable. A 6 percent interest charge was usually assessed on overdue accounts, but merchants seldom made vigorous efforts to collect the unpaid balances. Often outstanding accounts would remain unpaid for years. This reluctance to pursue debtors was both the result of a combination of communication delays and the chronic shortage of specie that afflicted the colonies.

A persistent shortage of hard money required even the large merchants in the port cities to accept payment for goods in kind. As business grew, the variety of items acquired in trade also grew. Thomas Hancock, for example, operated a general store not only to sell the manufactured goods he imported but also to dispose of additional items he accepted in exchange for these imports. Like most of his port city merchant peers, Hancock sold textiles, clothing, hardware, rum, and tea among his many wares.

Wars and Trade

During the various wars in the Americas, the range of goods available through merchants helped the British war machine. In the absence of a central quartermaster to organize military purchases, individual British commanders negotiated contracts with merchants to provision their armies with food, clothing, and other essential gear. The merchants also assisted the soldiers by offering payday loans. The slow communication of the era meant that some soldiers ran out of money before receiving their pay. Merchants bought the future wages of soldiers, at a discount, in exchange for providing immediate cash.

Until the eve of the American Revolution, merchants rarely cooperated with each other outside of partnerships. In 1761, the merchants of Boston, Newport, and Providence formed the first monopoly in America in an attempt to form a pool to regulate prices and restrict output of spermaceti candles and other whale products. The venture failed.

Boycotts of British goods had more success. The periodic boycotts that occurred between 1765 and 1774 brought temporary unity among patriot merchants. Neutral and loyalist merchants, estimated to be more than 60 percent of all merchants, did not join these Revolutionary efforts.

Methodist Church

In contrast to Roman Catholicism and Protestant denominations that came to America with the first settlers, American Methodism grew out of the First Great Awakening that swept through the colonies during the 1730s and 1740s. Because the Great Awakening separated rigorous religious tradition from spirituality and biblical truth, new groups of believers formed all over, each seeking greater understanding and fulfillment in its members' relationship with God.

An outgrowth of the Anglican (Episcopal) Church, or Church of England, the first Methodist meeting was held in New York City, in the sail loft of a Manhattan rigging house. Five people attended this meeting, organized by Philip Embury.

Two individuals who affected the establishment of this new denomination were John Wesley, an ordained Anglican priest, and George Whitefield, a dynamic preacher and Anglican evangelist. Arriving in the colonies during the 1730s, each developed an enthusiastic following, and people swarmed to hear them preach their transformational message. This asserted that all men and women were equal before God and thus did not require any kind of intermediary—such as a priest or minister—to stand between them and God or interpret the Bible.

Indeed, coupled with the emerging egalitarianism that was developing during the years leading up to and following the American War for Independence, the Methodist message attracted hundreds, then thousands, of followers. While there were approximately 50 to 60 Methodist congregations in 1780, by 1820, there were more than 2,700. After 1820, that number multiplied dramatically, and approximately one of every thirty-six Americans declared himself or herself to be a Methodist.

Francis Asbury, born in England in 1745, became the first Methodist bishop in America. During the Revolutionary War, he tried to remain neutral. But as he had ties to England, he eventually sided with the loyalists. He was able, however, to mediate many of the differences that were arising between the Northern and Southern Methodists. Traveling extensively, he crossed from one end of the country to the other many times. It is estimated that Asbury traveled more than 300,000 miles in twenty-four years. When illness finally overtook him, he had to give up much of his ministry. Asbury died in 1816 at the age of 71.

During the War for Independence, other Methodists also found it hard to remain neutral. John Wesley had urged preachers to refrain from taking a political stand, but that led many to view Methodists as Tories. The perception was unfortunate, since most Methodists believed in individual freedom of conscience and choice.

Methodism also supported the establishment of missions. This outreach garnered new members among the middle class, the poor, and other overlooked populations all over America and abroad. Itinerant preachers traveled the countryside, inviting all to participate in lively camp meetings. The meetings became as much social events as religious ones, especially for those who lived in rural areas. Hymn singing took on great importance at these revivals, and several new hymnals were published, including three volumes by John Newton, whose best-known hymn is "Amazing Grace."

As a result of its democratic tenets and its bold style of worship, slaves and free African Americans flocked to the newly established church. Moreover, Methodists, like Baptists, readily appointed black preachers and incorporated black members into their congregations. John Marrant, the first African American missionary to successfully minister to the Native Americans, converted a number of the Cherokee and was ordained as a Methodist minister in London in May 1785.

Another African American, Richard Allen, was born a slave in Philadelphia in 1760 and eagerly adopted Methodism at age 17. His master, also a Methodist, allowed Allen the opportunity to earn his freedom when he chose to become an itinerant preacher. Though he preached to white and blacks

alike, racism was still a dividing issue, so he founded Bethel Church, a congregation of African Americans, in 1793. It wasn't long before other black congregations formed, and, in 1816, these congregations joined together to form the African Methodist Episcopal Church. Richard Allen served as its first bishop.

The first Methodist Episcopal church in America was built in New York City in 1768 by Barbara Heck and her cousin, Philip Embury. A Wesleyan convert from Ireland, Embury had started preaching there a few years earlier. (Museum of the City of New York/Bridgeman Art Library)

In 1780, the American Methodists, like the Quakers, declared that slavery was “contrary to the laws of God, man, and nature.” By 1785, the Methodist Church urged its members to free any slaves they owned. Of course, this declaration met with great resentment in the South, so that by 1800, the church withdrew its outspoken opposition.

American Methodism also supported the practice of speaking in tongues, as well as belief in miracles and dreams. These mystical elements of Christianity had long been repressed in other sects and denominations, but they contributed greatly to the religious and spiritual revival that led to the establishment and growth of the Methodist Church.

Mexico City

Mexico City, today one of the largest cities in the world, was at the center of a monumental struggle between Europeans and native peoples in the sixteenth century. It has served alternately as the capital of the ancient Mexican empire, the central city in Spain's North American colonies, and Mexico's modern-day capital.

Mexico City's Metropolitan Cathedral, the largest in Latin America, was begun in 1573 with stone from ruined Aztec temples and completed in 1675. It introduced the European baroque and neoclassical architectural styles to New Spain. (Library of Congress, LC-USZC4-6810)

Mexico's central valley, which had been inhabited for thousands of years before conquest, was, in the 1500s, the center of a populous, powerful society. Spanish soldiers and their native allies were able to conquer the Mexica, an indigenous group of Nahuatl speakers, in the 1520s, and put a new colonial regime in their place. Mexico City, built on the site of Tenochtitlán, served as a center from which the Spanish could administer their expanding New World empire while they tried to recreate Spanish institutions in the Americas.

In the thirteenth century, the Valley of Mexico was divided into a number of rival city states, of which the Aztecs were one—technically speaking, these were the Mexica. The Mexican state expanded through warfare and intimidation. By the early-sixteenth-century reign of Montezuma II, it encompassed both central and southern Mexico in a vast tributary empire.

Tenochtitlán, the center of the Mexican empire, was built on a group of islands in a shallow lake and was home to about 200,000 residents. The Mexica had also constructed a number of causeways, bridges, and aqueducts to facilitate travel through the huge city and to bring fresh water to its many residents. The city's sacred center featured a number of large stone buildings, including the massive main temple. Like the Castilian society it was about to encounter, Mexican society engaged in intensive agriculture, maintained a strict social hierarchy, including dynastic rulers, and believed in comparable religious systems.

The arrival of the Spanish under Hernando Cortés in 1519 brought an end to Tenochtitlán. The city itself was the site of several bloody battles, including the Spanish ambush at the feast of Huitzilopochtli. Using a fortuitous combination of epidemic disease and aggrieved native allies, Cortés was able to conquer Tenochtitlán by 1521. The Spanish enslaved or killed many of the defeated Mexica—feeding priests and nobles to their war dogs was not uncommon—and forced their newly captured slaves to construct a cathedral and palace for Cortés out of the ruins of their city. The atrocities committed by the Spanish during the conquest are documented in the accounts gathered by conscientious priests, who interviewed subsequent generations of Nahuatl speakers. A notable example of such an account is the Florentine Codex, compiled by Bernardino de Sahagún.

After the conquest, the newly constructed Mexico City became a center of Spanish culture in the Americas, as well as an administrative center from which the Spanish could conduct the business of empire. To this end, Mexico City became the site of the first printing press (1539), the first cathedral (construction began in 1530), and the first university (1551) on the mainland.

Colonial Mexico City was a diverse and intriguing place. Enslavement of the native peoples was abolished in 1542, but they continued to be treated as second-class citizens, and African slaves began to appear in greater numbers. Several social and racial strata existed, partly the result of a dearth of Spanish women in the region and the lower status accorded to *criollos*, or Spaniards born in the New World.

Shortly after the conquest, Franciscan missionaries began to arrive, and other religious orders, including the Augustinians, Dominicans, and Jesuits, followed. The priests, apart from constructing churches and instructing their native parishioners, also helped to develop a distinctly Mexican culture, a hybrid of Spanish and indigenous traditions. The Christians' success was aided by the reported appearance of the Virgin Mary to a Native American in 1531.

Mexico City continued to be the backdrop to a number of crucial social, religious, and economic developments, as Mexico worked out its own national identity. Following the upheavals of the 1810 independence movement, Mexico City became the capital of the modern nation of Mexico.

Military and Diplomatic Affairs

Warfare and diplomacy profoundly shaped the colonial era as Native Americans, European colonists, and dynastic European states struggled for control of North America. Internecine conflicts among native peoples, confrontations between them and white settlers, and imperial wars and diplomacy shaped the lives of nearly everyone in early America. In the end, warfare and diplomacy allowed European Americans to dominate the eastern quarter of North America.

Precontact Native American Warfare and Diplomacy

Precontact Native American warfare and diplomacy was generally limited in its scale and scope of violence. Among the Eastern Woodland peoples, “mourning war” reigned supreme. Mourning war was a highly ritualized form of warfare and diplomacy, in which vanquished foes and captives often served to “replace” those lost due to disease, war, or migration in native communities.

Raiding parties would venture forth, take captives, and return to the war party's home village with those captives in order to apportion them among grieving clans. At that point, the elder women of the clan determined the fate of the captive. Males usually suffered death by excruciating torture; the women and children were most often incorporated into the clan via adoption. Mourning war also offered young men the prestige that came with leading war parties and taking captives.

Europeans would speak of the “savagery” of native warfare—“proof” being the brutal torture of prisoners. Mourning wars, however, included relatively limited violence, especially when compared to the gross slaughter that Europeans subjected each other to in the so-called Wars of Religion in the sixteenth and early seventeenth centuries. At its basic level, war among precontact native peoples was primarily a personal affair and rarely required the full resources of a native community.

A key to the limited nature of Native American warfare was the dichotomous relationship between cultural exchange and warfare within native communities. Most indigenous peoples understood diplomacy, and thus issues of war and peace, as hinging on reciprocal relations. As long as a “tributary” person, group, or village submitted to a putative dominant group, affairs—meaning trade and cultural exchange—could proceed normally. The breakdown of reciprocity, caused by migration, poor harvests, changes in leadership, or pandemics, often led to war.

Indeed, most native peoples sought to end war quickly and with as little dislocation to their group as possible. Some civilizations, such as the precontact Mississippian peoples at Cahokia, could not survive in a world in which war, rather than reciprocity, ruled. Others, like the tribes who fled the Iroquois to the area the French called the *pays d'en haut* (the Upper Ohio Valley), built peaceful communities on a middle ground that rested on a foundation of trade and cultural exchange.

Native American confederacies played an important role in arbitrating issues of war and peace. The English placed their first permanent settlement in North America in the territory of the most powerful native confederacy on the eastern seaboard, the Powhatan League. The Powhatan naturally saw the English settlers as interlopers but, because of the latter's weak state, they assumed the Europeans would become another tributary people. The military and diplomatic history of the early Chesapeake is one of tentative attempts by Native Americans and Englishmen to build a reciprocal relationship, based on trade and exchange, which fell apart in periods of violence and destruction.

Ironically, the Powhatan's success as masters of the precontact Tidewater contributed to their downfall. English settlers capitalized on discontent among the Powhatan's tributary nations and encouraged them to break free of Powhatan dominance. By the mid-seventeenth century, English colonists, their native allies, and, most significantly, diseases had destroyed the Powhatan confederacy and made the colonists the new masters of the Chesapeake.

In 1609, the French explorer Samuel de Champlain encountered and subdued Huron Indians in southern Ontario. Unlike other native peoples, who faced annihilation at the hands of Anglo-Americans, the Huron formed a fur trade alliance with the French that enabled both groups to dominate the region. (Brown Brothers, Sterling, Pennsylvania)

Not all Native American confederacies fell as quickly as the Powhatan. The Iroquois League, founded in the sixteenth century among the five Iroquois nations of present-day upstate New York (the Mohawk, Oneida, Onondaga, Cayuga, and Seneca), was the linchpin on which inter-native and European-native affairs in the Northeast hinged throughout the colonial period. English colonists and imperial administrators focused their diplomacy and distribution of annual “presents” of European trade goods, weapons, and alcohol on the League, in hopes of making the Iroquois proxies in the settler-native and imperial wars. Only in 1701, after the League staked out a neutral position between the English and French in the “Grand Settlement” at Montreal, did the Iroquois break free from their descent into European wars.

The eighteenth century witnessed a diplomatic dance among the Iroquois League, the British, and the French. Anglo-Americans sought to turn the Iroquois into their janissaries, while officials in Montreal and Quebec tried to win Iroquois support as a foil against British imperial ambitions. Complicating matters were the pro-French Kahnawake Iroquois, who had moved from New York to near Montreal. Neutralists within the League struggled to remain aloof from European wars and to prevent civil war between pro-English and pro-French native factions.

The Creek Confederacy in the Southeast shared much in common with the Iroquois League. Comprised of Muskogee peoples, who migrated from the west in the precontact period, the Creek Confederacy proved to be one of the most permanent and robust native groupings throughout the colonial period. Much like the Iroquois, the Creek played European powers against one another. The Creek juggled relations with the English settlers of Georgia and the Carolinas, the Spanish in Florida, and the French in the Lower Mississippi Valley. Unlike the other native peoples of the Southeast—the factious Cherokee, for example—the Creek offered a unified front against the European powers. In the end, the Confederacy’s demise came only in the early nineteenth century, after Americans had driven the other colonial powers from the Southeast and the Creek had lost their bargaining leverage.

Impact of European Arrival

The settlement by Europeans in the seventeenth century dramatically altered the military and diplomatic landscape of early America. Within one generation, settler-native wars and diplomatic relations had replaced precontact ways of war and diplomacy.

European-Native American wars dominated war making and statecraft in North America for a century. The settler-native wars were primarily local affairs fought without the support of the European states. Especially between the English and native peoples, military strategies became increasingly less formal as Europeans struggled to adapt to native ways of war.

Perhaps no factor shaped the seventeenth-century settler-native wars more than the European experience of war. The first European settlers, particularly the English mercenaries who arrived in Virginia and New England, were products of the Wars of Religion. As such, they knew war as all encompassing. For them, there were no distinctions between combatants and noncombatants. Everything, from villages and fields to women and children, was considered a target for military action.

While the devastation wrought during the Wars of Religion appalled Europeans and inspired them to moderate and limit war, Europeans in North America made no such transition. While Europe progressed toward the eighteenth century’s “age of limited warfare,” Anglo-American colonists normally looked to exterminate their enemies or, at least, drive them out of the area.

Affairs of war and diplomacy between settlers and Native Americans varied. The relative strength of the settler community vis-à-vis the neighboring native peoples, as well as the colonists’ motivation for coming to North America, influenced the nature of relations.

The settlers, priests, and traders of New France and New Spain, because of their small numbers and interest in trade and proselytizing, found themselves largely unwilling to confront Native Americans, other than in cases where they needed to assert their authority. As a result, they generally had positive, or at the least ambivalent, relations with indigenous peoples.

The English, with their rapidly increasing population that voraciously sought to claim native lands and the resources that could be extracted from those lands, had much more contentious and hostile relations with native peoples. Indeed, the uses and need for land were the key factors that governed English-Native American relations. Within the mix of population, interests, ambitions, and attitudes, two series of conflicts—wars to establish a settler

foothold and wars to expand English settlement beyond the “first frontier”—shaped their wars and diplomacy.

The major wars fought to establish a European foothold include the wars in Virginia (the Indian War of 1607–1608, the misnamed First Indian War of 1622–1632, the Tidewater War of 1644–1646, and the Susquehannock War of 1675–1676) and New England's seventeenth-century wars (the Pequot War of 1637–1638 and King Philip's War of 1675–1676). In these wars, settlers enlisted Native Americans to kill other native peoples. For example, in the Pequot War, the English turned to the Narragansett to help them extirpate the Pequot. While the unrestrained slaughter that the English perpetrated on the Pequot at the Mystic River Fort supposedly shocked the Narragansett, these English allies didn't hesitate to enslave the Pequot and expropriate their lands.

Throughout the seventeenth century, there was a rush to secure native allies and proxies. As noted, the English focused their diplomatic energies on the Iroquois, while the French in Canada wooed the Iroquois' traditional enemies, the Huron, Mi'kmaq, Malisett, Abenaki, Shawnee, Delaware, Miami, Ottawa, Pottawatami, and others.

During King Philip's War, the English had forged a diplomatic alliance with the Iroquois known as the Covenant Chain; this alliance proved decisive in both King Philip's and the Susquehannock wars. Of course, Mohawk warriors were also motivated by economic rewards, such as the bounties that settlers had placed on their enemies' scalps.

Meanwhile, the governor of New France became “Onontio,” or “father,” to the native peoples of the Maritimes and the St. Lawrence River area, the Ohio *pays d'en haut*, and the Choctaw of the Lower Mississippi Valley. In the 1680s and 1690s, Onontio unleashed his native “children” on the Iroquois of the Covenant Chain. The result was a major diplomatic coup for New France in the Grand Settlement of 1701 that, in effect, left the English without reliable native allies in the Northeast.

Of course, neither the English nor the French depended solely on Native Americans to fight their wars. After decades of fighting alongside and against Native Americans, the Europeans, starting with the French, also began to incorporate native forms of warfare in their style of fighting. By the late seventeenth century, France's regular troops stationed in North America (called the *Troupes de la Marine*) and the Canadian militia had adopted native-style warfare: small-unit operations, skirmishing, and what today we call guerrilla warfare.

The English made similar attempts to learn from both their Native American enemies and allies. In King Philip's War, some English settlers recognized the difficulties of protecting a porous frontier, as well as the potential impact that destroying the Native American base of supply would have in stopping the guerilla attacks. Captain Benjamin Church of Plymouth therefore formed a company-sized unit of around thirty settlers, supported by native guides. Church's aim was to take the field and best the native raiders that were then infesting the New England frontier. By the 1720s, British “rangers” could be found wherever and whenever the English and Native Americans came into conflict.

In time, the rangers took advantage of the generous bounties on scalps that the British assemblies first had offered to their Native American allies. When combined with their forefathers' legacy of extirpative war, they created Americans' first way of war. Built on wide-ranging forays, scalping, and violence directed against enemy noncombatants, this first way of war became the centerpiece of American military culture well into the nineteenth century.

Wars of Expansion

In the wars to expand British settlement beyond the first frontiers of southern New England and the Virginia Tidewater, British Americans embraced both the first way of war and Native American allies. During the Tuscarora War (1711–1715) in North Carolina, British rangers and tributary Catawba waged a war of extermination and enslavement on the Iroquoian Tuscarora. The English thoroughly pummeled the Tuscarora and drove them to seek protection from their cousins in New York, where they became the sixth member of the Iroquois League.

A similar chain of events transpired in South Carolina during the Yamasee War (1715–1717). Ironically, the Yamasee had helped the English defeat the Tuscarora. The English, now aided by Covenant Chain Iroquois, crushed the Yamasee and thereby opened much of South Carolina to slave-based plantation agriculture.

In New England, in Dummer's War (1724–1725)—also known as Father Râle's War, Lovewell's War, and Gray Lock's War—British-American rangers roamed the Maine frontier, seeking Abenaki men, women, and children to scalp. The events of the war included the English destruction of the Abenaki village at Norridgewock and the death of Captain John Lovewell, a British ranger who had made a small fortune cashing in on scalp bounties.

The wars to expand British settlement saw both the creation of “new” and the strengthening of “old” European-Native American alliances. The English, in the Catawba and Savannah, found trusted allies, who would help protect the southern frontier from the encroachments of other native peoples (Cherokee and Creek) and Europeans (Spaniards and Frenchmen), as well as become partners in expanding the native slave trade. The Catawba became the most trusted of the southern tribes and prospered in a “New World” of British domination. The Yamasee, driven from Carolina, fled to Florida, where they allied themselves with the Spanish. In return for Spanish protection, the Yamasee served as a buffer against British advances southward from Charles Town.

In the North, the French redoubled their commitment to their allies. They understood that the protection of Canada depended on maintenance of the good relations with native peoples, and, in the 1720s and 1730s, they built more Jesuit missions among Native Americans. By the 1740s, a well-developed system of alliances and pacts had been created in North America.

Imperial Warfare

Imperial warfare came to North America at various times during the second Hundred Years' War (1689–1763). The imperial wars among Great Britain, France, and Spain consisted of four conflicts that ran concurrently with European wars: King William's War, Queen Anne's War, the Wars of King George II, and the French and Indian War. The European monarchies saw North America as a theater of secondary importance, after their struggles for dynastic control of Europe. As a result, they generally sought to wage war in America “on the cheap.”

France fought in North America for the preservation of the status quo, England, originally, for commercial advantage, and Spain, for the survival of its

colonial outposts on mainland North America. Colonists fought for expansion of dominion and empire in North America, while Native Americans increasingly found themselves mired in wars of anticolonialism.

King William's War (1689–1697), known in Europe as the War of the League of Augsburg, set the pattern for the rest of the imperial wars: French and Native American offensives against the frontier, followed by unsuccessful British invasions of Canada. Indigenous forces (British American provincials and rangers, Native Americans, and English-speaking Canadian forces) conducted virtually all the fighting. The French and their allies struck first, when Louis de Baude de Frontenac turned his *Troupes de la Marine* and native warriors loose on the New England frontier. In the summer of 1689, they destroyed several towns in present-day New Hampshire and Maine; in February 1690, they sacked Schenectady, New York.

British Americans responded with grandiose plans for a two-pronged invasion of Canada. A land force was to march up the Hudson River Valley and cross Lake Champlain to take Montreal from the west, while a seaborne expedition under William Phips would approach New France from the east. The land force never materialized, as New Yorkers feuded with one another over who would command the army. Phips, at least in the beginning, proved more successful. His fleet and army of British American provincials—colonials in the service of the British army—took poorly defended Port Royal in Acadia before setting out for Quebec. In the face of the guns and defenses of New France's most heavily defended town, however, Phips beat a hasty retreat to Boston.

After 1690, the French and Native Americans operated freely on the northern frontier. The New England colonial assemblies responded by issuing bounties on native scalps and calls to their native allies for assistance. Major Benjamin Church led his rangers on the "Eastward Expeditions" to Maine to kill the Abenaki. By 1697, when the Treaty of Ryswick ended the war in Europe, New Englanders were relieved to be able to put what Reverend Cotton Mather had termed their *Decennium Luctuosum*, or Mournful Decade, behind them.

Queen Anne's War (1702–1713), or Europe's War of the Spanish Succession, saw the Native American, settler-native, and imperial wars coalesce. For European Americans, success in the war depended on their relations with Native Americans. New France's governor initiated the conflict when, after having secured Iroquois neutrality at Montreal in 1701, he sent his native allies against New England's settlements to keep the English on the defensive. New England, with New York bowing out of the war for fear of alienating the Iroquois and driving them into the French camp, stood alone against New France.

The New Englanders responded by fortifying their frontier and offering bounties on Native American scalps. Despite the rangers' scalp-hunting efforts, French and Native American raiders operated with near impunity, and in 1704, they destroyed Deerfield, Massachusetts, in the Connecticut River Valley.

New Englanders hoped to drive New France from the war in 1707, but without the assistance of the Iroquois or New York, they could not advance up the Hudson River and Lake Champlain. British American spirits soared when the Crown promised them regulars for an attack on Canada. The 1709 campaign, in which colonial militia planned to advance up the Hudson River while British regulars attacked down the St. Lawrence River, was stillborn, however, when the Crown diverted the regulars promised for North America to Portugal.

The following year, a provincial army under Francis Nicholson took Port Royal, Acadia. In 1711, a storm at sea took the lives of 800 British troops en route to Canada and led to the abandonment of major offensive operations against the center of French power on the North American continent.

On the southern frontier, the colonists focused on the Spanish and their native allies. In 1702, Governor James Moore of Carolina unsuccessfully besieged Spain's main outpost in St. Augustine, Florida. The next year, Moore devastated the Spanish missions in the Florida Panhandle and captured nearly 300 Native Americans, whom he enslaved.

After 1703, British rangers focused on securing their frontier and enslaving indigenous peoples. In the Caribbean, offensive operations remained important as the English and French forces raided each other's colonies to destroy sugar plantations and seize black slaves.

The 1713 Treaty of Utrecht signaled a British victory. Great Britain, based on the provincials' success at Port Royal, took possession of Acadia (which it renamed Nova Scotia), won recognition of the Iroquois as British subjects, and garnered the right to a limited but annual trade (the *asiento*) in the Spanish Caribbean.

France took consolation in the fact that Canada remained firmly in its hands and seemed impenetrable to British attacks. With the loss of Port Royal, now called Annapolis Royal in honor of Queen Anne, the French began construction of the fortress at Louisbourg, on Cape Breton Island. A naval base at Louisbourg would protect the mouth of the Saint Lawrence River and the French merchant and fishing fleets in the North Atlantic, as well as provide a base for France's Native American allies to harass the British in the Maritimes.

Spain lost the most. Large parts of the Florida frontier became a no-man's land, as Spain directed a strategic withdrawal from the Florida Panhandle and abandoned its missions.

Following Queen Anne's War, the imperial struggle for North America entered the period of the "Long Peace." The European monarchs interfered little in the colonists' dealings with Native Americans. While peace ruled in Europe, the English settlers in North America fought the Tuscarora, Yamasee, and Dummer's wars. Great Britain's primary interest in North America remained in using the colonies to benefit the mercantilist system. When British merchants sought to extract more wealth from the *asiento* concession formalized following Queen Anne's War, war erupted on the southern and Caribbean frontiers.

The first of the Wars of King George II, the War of Jenkins' Ear (1739–1743), or the Anglo-Spanish War, originated from Great Britain's desire for a larger piece of Spain's trade with its North American colonies. Jingoists used Captain Robert Jenkins's confrontation with Spanish customs officers to justify a war.

British forces struck first in November 1739. Admiral Edward Vernon's British fleet sacked Porto Bello on the Isthmus of Panama. Both British and Spanish privateers, merchant ships commissioned by their respective governments to wage war, took to the seas and wreaked havoc on the other side's shipping.

In 1740, Brigadier General James Oglethorpe, operating out of Georgia, which the British had established in 1733 as a buffer between Spanish Florida and Carolina, invaded Florida. He hoped to destroy St. Augustine as a base for privateers and a haven for runaway slaves from the British colonies. While he could not penetrate the walls of the Castillo de San Marcos there, his rangers and Native American allies devastated the Spanish frontier.

The next year, a combined British-American force floundered outside Cartagena (in what is now the South American nation of Colombia) and failed to capture the city. Spanish forces seized the initiative in 1742 and invaded Georgia, but Oglethorpe easily drove them back to Florida.

In the war's last major action, in March 1743, Oglethorpe raided Florida, and his troops ravaged Spanish and native settlements. Nonetheless, the British did not see the war as a success. Despite a significant investment in lives and money, British traders remained excluded from Spain's North American colonies, although some privateers profited handsomely.

By the close of the War of Jenkins' Ear, it had merged into Europe's War of the Austrian Succession, which the colonists knew as King George's War (1744–1748). This was a limited affair for the European powers, but for the American colonists and Native Americans, it was alternately a war for dominion and anticolonialism. In Europe, Great Britain faced the combined armies of France and Prussia, as well as the threat of Jacobitism in Scotland. As a result, both France and Britain left their colonists and Native American allies to carry the burden of the fighting in North America.

British Americans welcomed the declaration of war as an opportunity to improve their economic and territorial standing at New France's expense. Once again, however, the French struck first and flooded the New England, New York, and Nova Scotia frontiers with raiders.

The American colonists, meanwhile, eyed Louisbourg. In 1745, Massachusetts Governor William Shirley raised nearly 4,300 colonial troops for an expedition against the French fortress. After a forty-seven-day siege, the New England forces, under the combined command of William Pepperrell and Commodore Peter Warren of the Royal Navy, victoriously entered Louisbourg. Jubilation swept the British colonies. Storms at sea wracked the French armada sent to retake Louisbourg and compelled it to limp back to Europe in 1746 without relieving the fortress.

Still, all was not lost for the French. They countered the fall of Louisbourg by increasing their efforts on the frontier. In February 1746, *Troupes de la Marine* and native warriors wiped out the British American garrison at Grand Pré, Nova Scotia. Other Canadians laid siege to Fort Massachusetts in the Berkshire Mountains of western Massachusetts and attacked Saratoga, New York. William Shirley's plan to take Canada then unraveled in the fall of 1746 in the face of poor planning and because the British regulars—troops the British government again had promised the provincials to support an invasion up the St. Lawrence—failed to arrive at Louisbourg.

The only tangible British American success in this war on the frontier occurred when Captain John Gorham and his rangers, in concert with their native allies from Maine, pacified the hinterlands of Nova Scotia. Gorham waged a ghastly guerrilla war against the Acadians and Mi'kmaq. His operation poisoned relations between British Americans and the Acadians, and it contributed to the British decision to deport the French population of Nova Scotia in 1755.

By 1747–1748, both sides had tired of the inconclusive war and awaited developments in Europe. The 1748 Treaty of Aix-la-Chapelle returned combatants to the *status quo ante bellum* (status quo before the war). To the great consternation and disappointment of New England, the British returned Louisbourg to France in exchange for Madras, India.

One positive wartime development for the British, however, was the improvement of their relations, driven by increased gift giving, with the Native Americans of the Ohio Valley. The Iroquois, particularly the Mohawk, feared that the British might supplant them with other native peoples as the primary benefactors of British largesse. William Johnson deftly capitalized on Iroquois insecurity, and, as a result, Iroquois commitment to neutrality started to waiver. France, for so long dependent on native allies, decided to act.

French and Indian War

France's decision to reassert its authority in the Ohio Valley precipitated the French and Indian War (1754–1763), also known as the Seven Years' War (1756–1763) in Europe. The French and Indian War is perhaps the best known of all the colonial wars, and it is certainly the most significant. Great Britain's eventual victory in the conflict radically altered the balance of power among British Americans, Frenchmen, Englishmen, and Native Americans in North America. At the time of the war, however, the British could not foresee the tremendous consequences their victory would have.

The French and Indian War began with the 1754 mission of George Washington to deliver Virginia's message to the French that they must evacuate their forts in the Ohio Country. Washington's skirmish at Jumonville's Glen sparked a worldwide conflagration.

In 1755, Britain sent Major General Edward Braddock and his army to remove the French from Fort Duquesne at present-day Pittsburgh. Braddock met with disaster on the Monongahela River, and another combined British American-Native American force under William Johnson stalled after fighting the French and their allies under Jean-Armand, Baron de Dieskau, to a draw on Lake George.

The one success of the British plan for 1755, which was supposed to win the war in one season, was the capture of Fort Beauséjour in Acadia, followed by the deportation of the French-speaking and Catholic Acadians. British failures on the frontier led to a repeat of the earlier imperial wars, as British Americans fled the backcountry in waves.

In 1756, the French complicated British efforts when they and their Native American allies took Fort Oswego in western New York. French officers, in an effort not to antagonize their allies, turned a blind eye as native warriors looted the fort and killed their prisoners. In 1757, the new British commander, John Campbell, fourth earl of Loudoun, sailed to take Louisbourg. The French, under Louis-Joseph, marquis de Montcalm, counterattacked on Lake George and laid siege to Fort William Henry. The infamous "Massacre" ensued when French officers again threatened their Native American allies seize the spoils of war.

Campbell returned to New York to find that the Crown had replaced him as commander-in-chief with Major General James Abercromby. In July 1758, Abercromby snatched defeat from the jaws of victory at Fort Ticonderoga. The year 1758 also offered the British promise of what was to come. Lieutenant Colonel John Bradstreet led a force primarily composed of British Americans and captured Fort Frontenac on Lake Ontario, Brigadier General John

Forbes and Colonel Henry Bouquet captured Fort Duquesne, and Major General Jeffery Amherst and Brigadier General James Wolfe took Louisbourg.

A recruiting poster for the Continental Army offers enlistees “a bounty of twelve dollars,” “sixty dollars a year in gold and silver money,” and other benefits. By the end of the colonial period, Americans had a tradition of war making and diplomacy that stretched back nearly 170 years. (Brown Brothers, Sterling, Pennsylvania)

Amherst took command of the British armies, and, for the 1759 campaign, he moved northward along the Hudson River-Lake Champlain front toward Montreal, while Wolfe approached Quebec along the Saint Lawrence. Wolfe won a place for himself in Britain's pantheon of heroes when he lost his life in his army's victory at the Plains of Abraham.

French forces attempted to retake Quebec at the Battle of Sainte-Foy in April 1760, but they failed. Amherst used his larger and better-equipped army to methodically reduce the French positions and, in September 1760, entered Montreal. Following the 1763 Treaty of Paris, France abandoned its claims to Canada, and Britons and British Americans toasted each other as members of the world's greatest empire.

Beyond witnessing the British Army's tremendous military and diplomatic victory, the French and Indian War saw a clash between American and British military cultures. The war was seen to continue colonial-British arguments over the proper role and place of British professional soldiers, colonial provincial troops, and British American rangers. Great Britain entered the war, assuming that it would be a limited conflict. American colonists, on the other hand, fought their part of the Seven Years' War to conquer their French and Native American enemies.

In time, Prime Minister William Pitt embraced the colonists' goals and promised to repay them for their costs in fighting the war. British field commanders, most notably Amherst and Wolfe, grudgingly came to value the colonial troops. Both Amherst and Wolfe had increasingly used American-born rangers, most notably the companies under Major Robert Rogers and Captain Joseph Gorham, to wage war directly against Native Americans and terrorize Canadian civilians.

The eviction of France from North America meant that Native Americans could no longer play Great Britain and France against one another. Their insecurity manifested itself in Pontiac's Rebellion, as the native peoples of the *pays d'en haut* sought to define the parameters of reciprocity in a new British-Native American relationship. British imperial administrators, having to contend with both Native Americans and American colonists who hoped to expand into the lands taken from France, faced a daunting task. The Proclamation of 1763 proved only a temporary salve to the concerns of Native Americans that colonial Americans would overwhelm them.

The colonial wars began to merge into Americas' expansionist wars at the end of the French and Indian War. Colonial Americans reacted negatively to ambiguous British policies, like the Proclamation of 1763 that would have limited their expansion west of the Appalachian Mountains. Beginning at the end of the colonial period, and stretching through the War of 1812, colonists fought a series of wars of conquest against the native peoples of the Transappalachian West. In each of those wars, all of them Native American wars against colonialism, colonial fighters turned to the first way of war.

Following the deportation of the Acadians in 1755, Americans focused their military energies on completely subjugating the Mi'kmaq of the Maritimes. In 1760 and 1761, combined British and colonial armies laid waste to huge tracts of the Cherokee homelands in a war to spread colonial settlement into present-day western North Carolina and eastern Tennessee. The “winning of the West” and Kentucky began in 1774 with the outbreak of Lord Dunmore's War in western Virginia. During the American War for Independence, the colonists would continue to fight Native Americans on the southern, western, and New York frontiers.

At the end of the colonial period, America had a tradition of war making and diplomacy that stretched back nearly 170 years. Although wars in colonial America paled in terms of the number of forces engaged as compared to contemporary European conflicts, they were no less important. Warfare and diplomacy were the colonists' tools to “clear” North America for settlement.

The colonists' wars were unlike most contemporary European wars in that they were unlimited wars for the conquest of enemy lands, and, therefore, were wars of extermination and removal. Native Americans, in that sense, fought all the colonial era's wars as wars of anticolonialism. Their goals centered on maintaining their independence, whether that independence revolved around maintaining the proper boundaries of reciprocity with Onontio or preserving

their lands from colonial encroachments.

Ultimately, the Native Americans failed. The product of the colonial wars and diplomacy was the eventual European American conquest and settlement of the lands between the Atlantic seaboard and the eastern range of the Appalachian Mountains.

Militias

The colonies developed militias for their own defense. Britain could not afford to provide sufficient numbers of His Majesty's troops. Constantly in debt, the mother country also was too far away to justify sending its army to protect the sparsely populated colonies.

In the Crown's opinion, if colonists wanted to journey to an unknown wilderness, they should be prepared to provide for their own defense. Lacking the tax base to support a professional army of their own, colonists turned to the age-old means of local protection—the militia.

Duties of the Militia

The militia provided more than an affordable means of protection. It was also an important aspect of the burgeoning republican philosophy guiding the American colonists. The citizen-soldier ideal, long an important aspect of Western philosophy, influenced the founding of colonial America as it had the Greek city-states.

Participation in the militia was understood to be part of a colonist's social contract. An individual, in return for his membership in the society, was obligated to render service unto the community. One way in which this obligation could be fulfilled was through militia service. Colonists were skeptical of a standing, professional army, but a voluntary militia that was locally based and could not be sent into service beyond the local community proved acceptable.

Although all able-bodied men, ages 16 to 60, were expected to serve in their local militias, class biases influenced the militias' organization and the quality of service one was expected to perform. Wealthy, elite units, usually cavalry, served in contradistinction to the common foot soldier, who was most likely from the poorer classes. Foot soldiers were required to provide their own weapons, and many could not. Therefore, it was not uncommon for militiamen to be forced to perform some kind of public service in return for their arms, much like the English working class who were compelled to labor in workhouses in return for charity. In fact, by the time the minutemen began to wage their uphill battle against British regulars for independence, the ranks of the colonial militias shared more in common with the impressed vagabonds, who comprised the bulk of European armies, than the colonists would have admitted.

At the start of the Revolutionary War, each colonial militia had its own regimental colors and standard. The Philadelphia Light-Horse Troop carried this regimental flag into several major battles. (New York Public Library, New York)

Despite the simplicity of its legal organization, the colonial militia was anything but static. The composition, as well as the performance, of militias depended largely on their location. New England found it easier to fill the muster rolls and maintain the militia, due to its concentrated population, than did the more sprawled-out settlements of the Southern colonies. Virginia, for example, experienced a fitful history of militia organization.

In the early days, when men were still starving, it was difficult to convince them of their obligation to serve. Whereas Boston could draft large numbers of men when Native American wars necessitated it, Jamestown could not. When it tried, as it did in the months leading up to Bacon's Rebellion, the colonial government suffered a breakdown. Virginians, it seemed, might be compelled to fight if the potential profits were large enough, and Nathaniel Bacon convinced them that they were. Thus, the Virginia militia, in many ways, resembled European mercenary armies more than the citizen-soldiers of Sparta or even Plymouth.

South Carolina provides another interesting counterpoint to New England. With a more scattered population than either New England or the Chesapeake, the colony faced constant problems in readying its militia to defend against Spanish and Native American encroachments. Although the militia had rallied to save the colony during the Yamasee War in 1715, the colony's assembly reported with apprehension only five years later that South Carolina's 2,000 militiamen were spread over nearly 150 miles. This was still a problem in 1738, when the colony's lieutenant governor, William Bull, reported to the assembly that an effective militia seemed "Inconsistent with a Domestick or Country Life."

South Carolina's biggest problem, however, was not its sparsely populated backcountry. Slavery had become the most formidable obstacle to organizing an effective militia in the Southern colonies. As the black population grew, and in South Carolina began to surpass the white population, the idea of arming blacks became increasingly unpopular, especially after the Stono Rebellion in 1739. The threat of a slave insurrection would continue to loom over the South, preventing Carolinians from arming their slaves and inspiring stringent restrictions on their mobility.

As a result, the majority of able-bodied men in South Carolina were precluded from militia service. Perhaps even more importantly, this caused the Southern militia, particularly in South Carolina where a black majority existed, to become primarily a means of policing and controlling slaves rather than a means of defense. Later, during the antebellum period, the Southern militias would develop into slave patrols as the focus of law enforcement and military organization in the South turned to defending and protecting the institution of slavery.

African Americans and the Militia

Because it posed an ideological affront to the citizen-soldier ideal, blacks' inability to serve in the militia might have been a foregone conclusion. African Americans did, however, make a significant impact on the colonial military. Both Massachusetts and Connecticut allowed blacks to enlist in their militias periodically, and, in 1707, the former required slaves to enlist and aid in building roads. Rhode Island also allowed both slaves and free blacks to serve. Even colonies that barred arming slaves and free blacks allowed members of both groups to participate in various forms of military labor or as musicians.

During the Revolution, African Americans fought on both sides. Thousands of slaves won their freedom from the British; the results for those who fought in the war on behalf of the colonists proved less profitable. While some black militiamen were rewarded by individual states, such as New Jersey, with freedom and even land grants, the march from militia service to citizenship was more gradual and indirect. It would take nearly a century—and another war—for black military service to pave a solid road to freedom.

Professional Army Versus Militia

Professional soldiers held notoriously low opinions of the American militiamen. As Daniel Boorstin notes, the American militia was "a most unmilitary outfit by European standards."

Rarely in the history of the colonies had the militias been trained by professional soldiers. The British, understandably, if unwisely, mocked the colonial militias' ragtag assemblage. Even General George Washington thought them an undisciplined lot and frowned upon their desire to elect their own officers. Such democratic impulses apparently had no place within the Continental army.

It was perhaps the French public who became the American militiamen's most outspoken supporters. Their long-standing animosity toward the British

made them the colonists' natural allies, and their fascination with America's frontiersman mythology translated into admiration for the minutemen. The French thought every American was an ace with a musket. Their legendary skill with weaponry was matched in the French mind only by their unbridled patriotism. French writers waxed poetic about the hardships militiamen endured—no shoes, ragged clothing, harsh weather, and scarcity of food. France's own burgeoning republicanism no doubt contributed to the glorification of the American cause and the lengths to which its citizen-soldiers would go to obtain independence.

Hardened French soldiers like Lafayette, however, dismissed the militia as “only armed peasants who have sometimes fought,” and doubted their ability to fight effectively, much less win a war against Britain. For victory, according to Lafayette, the expertise of professional soldiers was required, and the militia would “be useful only to ... make noise, and frighten” the enemy.

Still, the colonial militia emerged from the Revolution with a legendary reputation. They had seen considerable action and contributed successfully at the Battle of Saratoga and later at Cowpens. While Army officers on all sides remained reluctant to give much credit for the American victory to the militia, the image of the minutemen, patriots driven by a deep and abiding desire for liberty, endured. The history of the colonial militia remains a complicated one, despite the appealing simplicity of this image.

Ministers and the Ministry

Ministers who came to the New World in the late seventeenth and early eighteenth centuries landed in a turbulent and disorienting environment. There were various congregations scattered about, competing religious sects, an inadequate number of ministers, and hardly any of the supports for the ministerial authority found in the Old World, such as bishops or consistories to ordain and discipline ministers. Outside New England, there was no theological education or dependable salaries, and no assurance of continuity in any parish. Yet ministers came to the New World with their hopes and the energy to minister to these diverse groups of people with different religious needs, and they attempted to nourish and build a moral base for society, politics, and commerce.

In 1607, Jamestown, Virginia, became the first successful English colony established in America. The Virginia Company of London sponsored these first visionary settlers with the primary purpose of making a profit for the company. These nascent Virginians brought to the New World their Protestant religious institution, known as the Church of England (Anglican Church) and later as the Episcopal Church. (The Church of England had emerged from the 1534 Reformation that occurred during Henry VIII's reign.) Anglican priests began to minister to the colonists and, to some degree, to Native Americans.

Both the Pilgrims and Puritans saw the Church of England as corrupt and too papist. The Pilgrims did not think it possible to reform the Church of England, so they completely separated from England and its state church. In 1620, the Pilgrims obtained a land grant from the Virginia Company and established a colony in Plymouth, Massachusetts.

Some powerful Puritans held stock in the Massachusetts Bay Company, and, under the leadership of John Winthrop, they landed in New England in 1630. The Puritans also sought to reform the Anglican Church. They wanted to discard priestly vestments and the order of worship required by the *Book of Common Prayer*, reserve the Sabbath for worship only, recognize only the sacraments of baptism and communion (called the Lord's Supper), and install a congregational form of government instead of government by the bishops. With this emphasis upon the involvement of the laity in church government, the Puritans became known as the Congregational Church.

While the Puritans had no confidence that their reforms could happen in seventeenth-century England, they did not separate completely from England, as did the Pilgrims. Instead the Puritans came to America with a mission to build “a city upon a hill” to demonstrate the model for a Christian society, and then take that model back to England as the foundation for a new society.

Virginia and New England

Before 1680, there was little public religious life in the colonies except for that supported by the colonial governments. New England and Virginia recognized only the Congregational Churches and the Church of England, respectively, and these churches received tax money to support their ministers and ministry. Ministers functioned as spiritual leaders, teachers, and counselors. Between 1680 and 1770, however, religious diversity upended these two established colonial churches.

As the cultivation of tobacco expanded in Virginia, so did the landowners' prosperity and their appetite for land. The ambition for wealth conflicted with regular church attendance, and Virginians struggled with the importance of religion in their society; ministers had little support from the prosperous squires. In 1680, more than half of the thirty-five parishes in Virginia had no minister, and many had no church building. It took a concentrated effort under the leadership of James Blair, agent of the Anglican bishop in London, to renew the Anglican Church. In the 1690s, Blair led a campaign of church building, new taxes, and laws outlining church administration, which lasted well into the 1720s.

Two issues troubled the Anglican Church about Virginia: the clergy's independence from the squires, who made up the majority of the vestry and controlled the clergy's salaries, and the proposal to appoint an American bishop who would govern the Anglican churches and ordain ministers. This salary issue, called the Parson's Cause, peaked in the 1740s. Ministers were often immigrants without local support and so had to ingratiate themselves to powerful persons. At the same time, without tenure and a guaranteed salary, they could not be independent of the landowners. In 1749, the Virginia legislature approved an act that guaranteed ministers tenure from the time they arrived in the parish. The ministers accepted this law as their charter of independence and aggressively defended it.

The possibility of a colonial bishop appointed by the London Anglican bishop lingered until the eve of the Revolution. By this time, clergy and squires alike feared a curtailment of their liberties by a British bishop. The Anglican Church had been struggling with dissenters, principally the Baptists, and there was a call to renewal among the Anglican churches to begin with the local parishes and their program of worship.

In Virginia, one had to attend church at least once every fourth Sunday. In many areas, however, parishioners did not have the opportunity to attend services overseen by an ordained clergyman every week, because of the scarcity of ministers. The population was scattered across large plantations instead of being largely concentrated in towns and cities, and so ministers often had to travel a circuit of 60 to 100 miles or more, sometimes over rivers and through swamps. These challenges took their toll on a minister's health, morale, and effectiveness.

When the minister was present, he presided over a worship service structured according to the *Book of Common Prayer*. Ordinarily, the minister preached a sermon based on the biblical texts for the day and remained available for visiting with the parishioners after the service. Relying on the stretched resources of these itinerant ministers, the parish sometimes appeared more symbolic than central to life in Virginia.

In New England, the Great Migration of the 1630s and 1640s attracted more than 20,000 newcomers to the area. The Great Migration was more than just a movement of people across the Atlantic Ocean; this well-planned immigration had a religious dimension to it. The Puritans saw themselves as leaving behind a corrupt, vicious, and dying Old World, to build God's "city upon a hill" in the New World. These people had committed to a new society based on biblical teachings, and they felt obliged to become a model for others.

John Winthrop, a stockholder in the Massachusetts Bay Company and its designated leader, preached a sermon, "A Modell of Christian Charity," on board the *Arabella*. He exhorted the Puritans to observe the covenant, a mutual agreement between them and God. It was believed that if the people were obedient and faithful, they would be favored by God, but if they disobeyed the covenant, they would experience a calamity. The Puritans believed that every event had a cause and that any tragic event, such as drought, a town fire, illness, or pestilence, was the result of breaking the covenant. Ministers interpreted these experiences through scripture and demanded strict obedience to the covenant.

The Puritans chose John Calvin, the Reformation theologian, as the source of their theology. Calvin emphasized the sovereignty of God, the belief that no event happens except by the will of God, as well as the doctrine of predestination. Predestination taught that God had chosen a selected group of people, who would receive forgiveness of their sins and upon death would enter heaven. Those who were baptized and who searched for forgiveness had to adopt a life of piety, examine the biblical teachings and apply them to their lives, and attend church with the hope that one day they would feel confident of their election. With this confidence in their election, then they would publicly "claim" their conversion before the congregation. These converts then became "saints" with the right to vote on church and public issues.

Such practices led to an emphasis upon seeking new knowledge of the scriptures and following the guidance of the minister. Ministers had a heavy responsibility to study the Bible and its commentaries in order to teach and lead the people to an assurance of conversion. Puritans expected their ministers to be educated and able to interpret the Bible, and they opened Harvard University in 1636 with this aim. Later, some Puritans felt that Harvard had strayed from orthodoxy, and so they established Yale College in 1701.

Attendance at church was mandatory, and an absentee could be fined. Puritan meetinghouses were plain—no padded pews or religious icons, nothing to distract the worshiper from concentrating on the Word of God. The church represented the nucleus of Puritan life positioned in the center of town. The typical worship service included prayers, readings from the Bible, communion, and a sermon that followed a strict logical pattern: text, explanation, and then application.

Puritans appreciated a good, lively, thought-provoking sermon. As the spiritual leader of the community, ministers used several types of sermons—Sunday sermons (which could be up to two hours in length), Thursday sermons, election-day sermons, fast-day sermons, and special-occasion sermons—and they also conducted weekly catechism classes for the youth. Thursday sermons often were teaching sessions on some topic of interest to ministers and adult churchgoers, such as prophetic texts in Daniel and Revelation. These sermons provided an opportunity for the congregation and other ministers to hear sermons on difficult topics.

In New England, the average weekly churchgoer could hear approximately 7,000 sermons in his or her lifetime, which totaled 15,000 hours of concentrated attention to the Word. The Puritan communities had no competing public voices of a different viewpoint; the sermon was the only regular voice of authority.

By 1660, New England ministers had begun to notice a decline in church attendance and were concerned that the Congregational churches might lose

influence in their communities. Factors that influenced this decline included increasing commercial activities, population growth that increased the numbers of non-Puritans, and the movement westward for land by the second and third generations, which allowed them independence from their parents. Many Puritan congregations watched the children of older members ignore the churches or reject them outright.

The ministers began to preach “jeremiads,” sermons of complaint and remorse for the “falling away” from biblical teachings, emphasizing the need to repent and reclaim the covenant. Because of the paucity of new members, some ministers established the Half-way Covenant. This allowed children of baptized members to be baptized with the expectation that these children would eventually claim their own conversion and become full members of the church. Until then, these unconverted children could not participate in communion or vote on church matters, privileges granted only to the converted “saints.”

Not all Puritans accepted the Half-way Covenant because they thought it compromised the experience of conversion; however, Solomon Stoddard, pastor of the Northampton church, effectively used the Halfway Covenant to gain new more members. Stoddard allowed anyone of good character to take communion and assumed that such participation would aid in the quest for conversion. After Stoddard's death in 1729, his grandson Jonathan Edwards, a theologian and philosopher, became pastor of the Northampton church.

First Great Awakening, Religious Diversity, and Revolution

In 1734, Jonathan Edwards noticed that something distinct and strange had happened in his Northampton community. This “Surprising Work of God” became known as “The First Great Awakening.” While Edwards was preaching one Sunday about what he saw as the sins of the town's youth, the congregation suddenly became emotional and penitent and sought forgiveness for their sins. Without discarding his belief in God's sovereignty, Edwards understood this phenomenon as God's special work, affecting this generation. The emotion seemed to be necessary for people to have confidence in their salvation, although Edwards did not think that conversion stood alone on emotional demonstrations. He stressed that a change of mind was not the same as a change of heart, which implied deep feeling, a new direction for one's life. He concluded that one experiences both a mental and an emotional change in conversion.

To complement Edwards's unusual experience in Northampton, other ministers who related more to the common people became popular. England's George Whitefield, an Anglican minister, attracted large audiences in the South and New England. He preached the possibility and necessity of individual conversion for anyone with faith in God. Those who heard Whitefield praised him for his sermons' common language, his extemporaneous prayers, and his ability to establish strong rapport with his audiences.

In the Middle colonies, William Tennent Sr. and his four sons popularized the message of individual conversion by faith. A Scotsman, Tennent came to Pennsylvania and opened a one-room schoolhouse called the Log College in 1730. His son Gilbert's most famous sermon, “The Danger of an Unconverted Ministry” specifically addressed the question of who was best qualified to interpret biblical truth. For the Tennents, only the converted minister, regardless of education, had the necessary qualification to interpret the Bible.

Emotional demonstrations during these revivalistic services prompted a disagreement between the “Old Lights” and “New Lights.” The New Lights, such as Edwards, Whitefield, and the Tennents, accepted the combination of faith and emotion as authentic conversion experiences in those who changed their lives. The more traditional Old Lights rejected these emotional conversions as shallow in commitment and without enough substance to sustain the faith. Charles Chauncy of Boston's First Church represented the Old Lights' rational position, which primarily focused on “understanding” and strict clerical control over congregations. Edwards responded that the interconnections of thought and emotion were such that neither existed without the other. But even Edwards admitted that it was easier for converts to talk like saints than to act like saints.

The First Great Awakening brought Christianity to many Americans who otherwise might not have had the opportunity to hear they could decide for themselves whether or not to become a Christian. It also raised questions about the qualifications for the ministry. One had to ask what level of education ministers really needed and whether the experience of conversion alone was enough. This upheaval over ministerial authority received more attention as different denominations gained more members.

From the 1740s on, the role of the minister as the authoritarian figure in the colonies depended on what denomination people selected as the home for their religious faith. Ministers also contributed to the ideas and emotions that fueled the Revolutionary War.

In 1750, even before Great Britain tightened its control over colonial trade, Jonathan Mayhew, pastor of Boston's affluent West Church, proclaimed the duty of resisting a tyrannical government in his sermon “Discourse Concerning Unlimited Submission.” He called upon Christians everywhere to stand up for justice when it was in jeopardy. If governments existed for the purpose of protecting the rights and future of the people, then nothing good could result from a government that demanded its citizens submit when that government ruled in a way that was not best for the people.

In 1770, other ministers denounced the Boston Massacre, when British soldiers fired into a crowd, killing five colonists. One minister, John Lathrop of Old North Church, pronounced God's condemnation of this murder and characterized it as akin to that of Cain murdering his brother Abel, as written in Genesis 3:10. Ministers felt obligated not to ignore this act of treachery and proclaimed that if Britain did not change its policies of violence, then it should not rule these colonies.

Missions

Each of the major colonial powers—England, France, and Spain—saw in North America a prime opportunity to spread Christianity. In fact, Christianity became one of the tools of conquest in some parts of the Americas.

The ways in which each nation went about spreading the Christian faith varied dramatically. Accordingly, native peoples responded to European missionaries in different, culturally specific ways. Occasionally, tribes in close proximity to European settlements accepted missionaries as a way to lessen the impact of colonization on their communities. Other groups resisted missionaries' efforts from the outset, and some Native Americans incorporated aspects of Christianity into their own worldviews.

Spanish Missions

The Spanish were the first group of Europeans to missionize in the Americas. Franciscans (members of the order of St. Francis of Assisi) arrived in 1493 on Columbus's second voyage. In 1523, two years after the conquest of Mexico's central valley, Franciscans are noted as working in New Spain. A 1526 Spanish edict required that two priests accompany any exploration party in the Americas.

In the mid-sixteenth century, following run-ins with colonial officials and settlers in Mexico, the Franciscans moved into more remote areas of the empire, including Florida and New Mexico. The Royal Orders for New Discoveries, issued in 1573, declared that spreading Christianity was the primary motivation for colonizing and outlawed conquest. Accordingly, missionaries, now the spearhead of Spanish colonization, were to enter new lands first and pacify the native population with the Gospel.

In 1573, Franciscans began serious mission work in Florida, and, by 1598, they were constructing missions among the Pueblo peoples of New Mexico. Jesuits worked briefly in native communities in Florida and present-day Arizona, but the bulk of missionary work in Spanish America was performed by Franciscans.

The process of establishing missions was accompanied by rituals, intended to demonstrate the power of the priests. In 1629, at Cíbola, a Zuni pueblo, the colonial governor and a handful of accompanying soldiers kissed the friars' feet. A priest then announced that he had come to free the Zunis from their ignorance. Since their refusal to accept missionaries in the time of Coronado had resulted in war, Zuni leaders decided to accept a missionary among them. The missionaries in New Mexico became convinced that they were on their way to destroying native religion entirely and building a new republic of Christian peoples. The 1680 Pueblo Revolt, largely a response to Spanish religious intolerance, proved them wrong.

In Florida—the current state and parts of present-day Georgia, South Carolina, and Alabama—the Franciscans established missions in existing Native American villages. By 1675, there were four mission provinces in Florida: Guala, Timucua, Apalachee, and Apalachicola. In mission towns, Native American men and women were expected to adopt Spanish modes of dress and agriculture as a way to prove that they were moving toward civilization as the Spaniards defined it. The Franciscans worked diligently to dismantle Native American cultures, and they tried especially hard to convert native leaders and children, believing that these groups could turn the tide in the Franciscans' favor.

English missionaries like John Eliot shared the conviction of Spanish and French counterparts that their particular brand of Christianity was superior. Puritan missionary efforts reflected their emphasis on literacy and education. (Brown Brothers, Sterling, Pennsylvania)

As elsewhere, native peoples chose to accept Christianity on their own terms, selecting pieces of the doctrine that meshed with their own cultural perspectives and rejecting tenets that did not. Some native communities went along with the missionaries, hoping to gain access to a new realm of spiritual power. Tribes that moved regularly could spend part of their time in the missions and then relocate when the priests' demands became too burdensome.

The missions struggled against the effects of disease and slave raids by the English, which led to the decline of the mission provinces over the following decades. The missionaries also became less important as the Spanish began to rely more heavily on soldiers to colonize North America.

By the eighteenth century, the Spanish missions, driven by the Franciscans and funded by the Crown, had brought about a great number of conversions in Florida and New Mexico. To what extent the people who lived on the missions actually accepted Christianity is harder to define.

French Missions

The French, broadly speaking, began their North American colonies as commercial ventures. The early explorers, such as Jacques Cartier, preached their own versions of Christianity, but there is no evidence that Catholic priests were involved in their efforts. By the seventeenth century, the French were relying on a mix of trade and Catholicism to colonize

In 1608, the French under Champlain moved into the St. Lawrence River valley and founded Quebec. From this base, the French would send out hundreds of missionaries into Iroquois lands, the Great Lakes, and North America's vast interior. The Jesuits, who arrived in 1625, were the primary, but not sole, missionary order in New France. The Recollects (Franciscans) worked throughout the colony as well.

Jesuits working in New France faced chronic difficulties in manpower, supplies, and stability from one administration to the next. New France also faced continual raids from the Five Nations Iroquois, who, at that time, were loosely affiliated with the Dutch at Albany. Conversely, without its Native American population, New France would have been little more than a name on a map.

Missionary activity, and pretty much all colonial activity, in New France was closely connected to the fur trade, which developed first in the Iroquois lands and later in the Great Lakes. To facilitate trade and conversion, the French formed a close bond with the Huron, an Iroquoian-speaking group, though not one of the Five Nations. The French missionaries perceived the Huron as particularly receptive targets. Other Iroquois, Algonquins, and Montagnais, however, were thought to be more hostile to the gospel.

Like the Spanish Franciscans farther to the south, French missionaries believed that native lifeways needed to be replaced with European ones in order to facilitate conversion to Christianity. The native peoples of New France were expected to participate in Catholic institutional life by enrolling in religious schools. Some Native American boys and girls were sent to French families in Quebec—and even France—to receive their Christian education.

By the middle of the seventeenth century, seminaries were failing for lack of students, and the Jesuits adopted a new approach, one more recognizable to students of colonial history. The Jesuits began to work closely with the fur trading company, and they began to educate Native American adults, as well as children. The Jesuits also came to understand that Christianity was not wholly incompatible with a wide range of native faiths, and sent missionaries out alone or in small pairs to live with bands of Native Americans. Both sedentary and nomadic missions were to be set apart from French colonial society, largely because of the perceived bad influence of French settlers.

The result of the shift in policy was that the French were able to reap fur trade profits from a huge chunk of North America, while using little in the way of French military force or European settlers. At mission communities, Jesuits also allowed Native American men and women some leeway in practicing a

syncretic form of Catholicism; native rituals coexisted with, and took on new meaning from, Catholic ceremonies.

English Missions

The English entered North America after the Spanish and the French. They, too, were confident that their own particular form of Christianity was superior to those in Europe and far superior to the religions practiced by Native Americans.

For decades, scholars wrote that the English, French, and Spanish modes of colonization were fundamentally different. It was believed that since the Spanish and French were interested in conquest and the fur trade, they were more concerned with religion's pacifying effects; as the English were settlers, and their industrious farms expanded into Native American territory, they left no room for compromise with native religions. Recent scholarship has shown that the English *were* concerned about the natives' spiritual well-being.

The first and most famous English missionary efforts spread from the Puritan colonies at Plymouth and Massachusetts Bay. The English, like other Europeans, found North America's indigenous population sorely lacking the accoutrements of civilization. The Puritans did believe that the Native Americans could be educated out of their backwardness, although the conversion process might be long and arduous. As in the Spanish and French mind-sets, the natives had to quit acting so much like natives if serious religious reeducation was to take place.

In the 1640s, John Eliot and his associates helped to establish towns of "praying Indians," most notably Natick, near some English settlements. From this privileged vantage point, Native Americans in New England could learn about civilized life in preparation for their conversion. John Eliot also translated the Bible into Algonquian and published a series of fictional dialogues between native people concerning the basic tenets of Puritan faith. Literacy and education were crucial aspects of English Puritan faith, and their missions reflected these goals. Over time, missionary efforts suffered as English settlements expanded and placed new pressures on native communities. Tensions boiled over in the 1670s during King Philip's War, a bloody conflict that divided New England along racial lines.

Comparing Missionary Efforts

Every missionary endeavor in North America must be seen as a combination of forces. Europeans varied in their approach to native peoples. The Spanish came first and were the most aggressive and successful in converting Native Americans to a European faith, in this case, Roman Catholicism. The French and English who followed were neither as determined to convert nor as thorough in their missionary efforts. The Jesuits, who spearheaded the French effort, were a determined group, but they suffered from a lack of money, missionaries, and government support. The English, while not entirely unconcerned with native conversion, were the weakest of the three main European colonizers as far as missionary work was concerned.

As for Native American acceptance of European missionary ideas, the record is mixed. Generally, native peoples tended to pick and choose, adopting those pieces of European religion they admired, while at the same time striving to maintain their political independence and, later, their cultural autonomy.

Mississippi River

The Mississippi River, which flows from northern Minnesota to the Gulf of Mexico, is the fourth-longest river on earth. It also has one of the largest drainage areas, ranking behind only the Congo and the Amazon. Just before and during the colonial period of American history, the Mississippi was at the heart of the largest Native American civilization north of Mexico, a crucial piece of France's North American empire, and one of many areas that Native Americans, the French, and the English struggled to control during the eighteenth century.

The human history of the Mississippi River began thousands of years ago when Paleo-Indians migrated into the region. Between 700 and 1250, the city of Cahokia flourished on the Mississippi River in what is now present-day Collinsville, Illinois, across the river from today's St. Louis. Cahokia, a theocracy, exacted tribute from tens of thousands of people in the surrounding area. It also participated in, and perhaps exerted some control over, trade networks that stretched across North America. Cahokian agriculture consisted of corn, beans, and squash, and these foodstuffs were supplemented by hunting and fishing.

Cahokia was the largest of what have been labeled Mississippian cultures. From 700 to 1400 (and beyond, in a few cases), paramount chiefdoms in the Mississippian mold dominated much of North America. Perhaps overextended or facing food shortages, Cahokia began to decline around 1150, and, by

1250, was all but abandoned. Smaller polities, ones that more closely resembled historic-era tribes, were the main political entities along the Mississippi River when Europeans arrived several hundred years later. Natchez, another Mississippian center on the river, was a notable exception: it retained elements of Mississippian culture into its encounter with the French.

The Spanish maintained a lukewarm interest in the Mississippi River. De Soto crossed the river in his 1539–1542 *entrada*, and his body may have been sunk in the river. The French, however, were the first Europeans to seize on the Mississippi's importance as a piece of their colonial empire. At the end of the seventeenth century, the French, trying to counter British endeavors on North America's Atlantic coast and Spanish colonies throughout the Americas, began to explore the region near the mouth of the river. Pierre Le Moyne d'Iberville established Biloxi in 1699, for instance. Marquette, Jolliet, and La Salle also tried to increase French awareness of the region to promote French trade and the Catholic Church. Along the upper Mississippi and in the adjoining Great Lakes region, the fur trade flourished, while farther south a wider range of economic activities occurred.

By the early eighteenth century, the river was at the center of a contest among the French, English, and Native Americans for control of the region. Matters came to a head when traders operating out of Carolina armed the Chickasaw. The resulting conflict left 1,800 Chickasaws dead and another 500 enslaved. The French were able to secure alliances with many of the tribes along the Mississippi River in the early eighteenth century, as they were doing at approximately the same time in the St. Lawrence River valley.

One often-overlooked component of the French North American empire is Illinois country. Though its French population was smaller than those at Montreal, Quebec, and New Orleans, a substantial number of priests, soldiers, and settlers were moving through the region by the middle of the eighteenth century. Towns that were founded primarily as missions and for trading purposes (such as Cahokia/Fort St. Louis and Kaskaskia) were becoming agricultural settlements peopled by a mix of French laypeople, clergy, and Native Americans of various tribes. Since neither Native Americans nor Europeans could control the region, one scholar has labeled it a “middle ground.”

The fragile middle ground collapsed in the wake of the French and Indian War. The French gave up their North American possessions. The native peoples living along the Mississippi River were faced with an aggressive, expansionist set of colonies and, later, an American nation intent on displacing tribes to the west of the Mississippi. The Mississippi River took on symbolic meaning in Jacksonian America as the dividing line between the white and Native American worlds.

Mohawk

The Mohawk were a branch of the Iroquoian language group in North America and one of five founding members of the Iroquois Confederacy. Their villages lay northeast of Lake Erie in what is now upstate New York. Because of their easternmost position in the lands of the confederacy, the Mohawk were known as the “Eastern Doorkeepers.” Mohawk was the name applied to the people by their Algonquin enemies; their real name is Kanien’Kehake, meaning “The People of the Flint.”

Like other Eastern woodlands native peoples, the Mohawk practiced a mixed subsistence economy—hunting and gathering, supplemented by agriculture. Labor was divided between the sexes, with women doing the farming and food gathering while men hunted and fought as warriors. Households and clans were matrilineal. Clan mothers had great power over the domestic sphere and even wielded significant influence over the tribal leadership.

The main factor that enhanced the influence and power of the Mohawk in the region was their development, along with the other Iroquois Five Nations, of a more complex political and diplomatic structure. According to Iroquois traditional lore, it was the Mohawk leader Hiawatha who established the Great League or Confederacy. This probably occurred in the early sixteenth century. Prior to this, there were numerous and destructive wars between the Five Nations. Hiawatha also allegedly established the main diplomatic instrument for preventing such conflicts—the condolence ceremony, whereby ritual and tribute settled blood feuds before they escalated into war. Once they were at peace with one another, the Iroquois turned their aggressions outward.

Young Iroquois warriors were always eager to earn the prestige that came with victory in battle. In addition to honor, warfare also brought captives who replenished the tribe's population, and, according to Native American religious beliefs, enhanced the tribe's spiritual power.

By the seventeenth century, the need for captives was more pressing because diseases brought to North America by Europeans were rapidly diminishing the population of the native peoples. Clan mothers demanded more captives to replace those in their communities lost to smallpox and other epidemics. Tribal leaders complied by attacking their Algonquin neighbors and other Iroquoian-speaking tribes that were not part of the league. However, these conflicts, called "mourning wars," were trivial compared to the much greater intertribal wars that resulted from the expansion of the European fur trade in the Great Lakes region.

The French were the first Europeans to establish trading settlements in the region, founding Quebec in 1608. Their presence had an instant effect on the native population. French traders formed alliances with the Algonquian-speaking peoples north of the Great Lakes. The Huron, an Iroquoian tribe, broke with the Five Nations and joined the French trading bloc. The allies of New France were the most able hunters of the region and had access to the richest hunting grounds for beaver, but the men of the Five Nations were the better warriors. Effectively shut out of the fur trade, the Mohawk and their Five Nations brethren began attacking trading parties of French-allied neighbors, seizing fur-laden canoes on their way to Quebec. With superior weapons provided by French traders, the enemies of the Mohawk began to turn the tide and defeated the Mohawk in 1609.

Disaster for the Five Nations Iroquois was averted when a new European power entered the colonial arena in North America. In 1614, the Dutch established a permanent trading colony at New Amsterdam and built Fort Orange on the Hudson River near Mohawk lands. The Dutch became the principal rival to the French on the St. Lawrence River for access to the furs of the Great Lakes. The Iroquois Confederacy established trading ties with the Dutch, who could supply them with the weapons their enemies to the north received from New France. The region now became a battleground between the two commercial-military alliances.

During the intense and ferocious "Beaver Wars" that ensued, the Mohawk became the military arm of the Dutch trading empire. As the easternmost member of the league, the Mohawk became middlemen, providing Dutch guns and other manufactured goods to the Five Nations. As their own importance within the confederacy was enhanced, the Mohawk led fierce attacks on the Algonquin and Huron allies of the French. The desire for access to lucrative trade was reinforced by the need to replace their own growing losses to war and disease with captives. The Five Nations crushed the Huron, destroying entire villages and adopting the surviving women and children. In doing so, they also cemented their own central position in the European trading system.

In the 1660s, new challenges confronted the Iroquois. The English conquered the Nations' trading partners, the Dutch. Commercial rivals, the Susquehannock and Mahican, succeeded in beating back Iroquois assaults. Furthermore, French reprisals against Mohawk villages had begun to take a heavy toll on the tribe's population. According to some estimates, the Mohawk lost six out of every ten warriors. Never again would the tribe be as dominant as it was in the 1640s. To escape these attacks, many Mohawks fled to Canada and joined "praying Indian" villages supervised by the Jesuits.

During the eighteenth century, the Mohawk and the confederacy adapted and recovered their central position in the fur trade. They adopted a strategy of playing the British and French against one another to negotiate more generous trade concessions. By remaining neutral in Anglo-French conflicts, the Iroquois hoped to have the best of both worlds. The fall of New France in 1763 irreparably undermined this strategy.

During the American Revolution, the Mohawk, led by their chief, Joseph Brant, split with the Five Nations and gave their support to the British. When the colonists won the war, it spelled doom for the Mohawk in their traditional homeland. After the war, remaining members of the tribe relocated to Canada, where the British government rewarded them for their support with land.

Mohegan

The Mohegan Indians lived along what became the Thames River in southeastern Connecticut and developed as close relations of the Pequot people. In 1600, the population of the two tribes totaled about 16,000.

In 1626, Uncas, son of the Mohegan sachem, married the daughter of Tatobem, the Pequot sachem. While this cemented their connections in the fur trade, it laid the groundwork for future conflict. Uncas began to contest Pequot authority, and, when the Dutch killed Tatobem in 1634, he and others

"defected" to the Narragansett. When the English established Fort Saybrook, Uncas saw an opportunity to gain power in the region.

In 1636, Uncas offered to help the English fight against the Pequot, and, in May 1637, he joined the force that attacked Mystic Fort, killing many and scattering the survivors. As the campaign continued, Uncas sought to gather as many as of his people as possible to build up Mohegan power, and his became the leading Native American group in eastern Connecticut. New conflicts erupted with the Narragansett, led by Miantonomo, as the two tribes became rivals.

In 1638, the English colonists summoned Uncas and Miantonomo to a conference in Hartford. The resulting treaty required both to submit disputes to the English. Soon, rumors, possibly orchestrated by Uncas, convinced the English that Miantonomo was forging a hostile alliance with the feared Mohawks. In July 1643, when simmering hostilities flared into war and the Mohegan captured Miantonomo, the Puritans authorized his execution and promised to protect Uncas against retribution.

Miantonomo's death did not result in peace. In February 1644 and May 1645, Narragansett war parties hit Mohegan villages, retreating only when the English intervened. The Mohegan, in turn, battled Narragansett allies, including the Pocumtuck and Nipmuc in western and central southern New England. Uncas also continued to pressure Pequot remnants and to gain dominance over the Montauk on eastern Long Island.

While this warfare gradually came to an end, the colonists continued to suspect Uncas's independence (he barred Puritan missionaries) and aggressive ambitions. Yet the Mohegan remained loyal military allies, and, at the outbreak of King Philip's War, they offered their assistance. As in the Pequot War, the Mohegan provided important support for English forces and carried out their own attacks on the enemy. After the war, the elderly Uncas and his son, Owaneco, reconfirmed their allegiance to Connecticut. Uncas died around 1685.

At the turn of the century, about 600 Mohegans remained, but their lands were shrinking rapidly. Tensions emerged as Connecticut began giving white settlers grants of land never sold by the tribe. In 1703, Owaneco accused the assembly of land fraud, and, two years later, the Mohegan filed suit against the colony. In 1707, a royal commission ruled in favor of the tribe. Connecticut appealed to the Privy Council, where the case died.

Additional tensions developed in 1720, when New London colonists reported hearing gunshots and seeing threats in the faces of their Mohegan neighbors. The Mohegan sachem assured the governor that his people were simply building a fort against Mohawk attack. But the colonists remained fearful; three years later, they limited how far Native Americans could travel from their villages. Connecticut authorities also intervened in Mohegan politics to ensure that their favorite, Ben Uncas II, became sachem.

From this point on, most Mohegans added their objection to the colony's meddling to their anger over its land grab. The tribe renewed its pleas against Connecticut in the 1730s. While the initial verdict in 1738 favored the colony, appeals continued the case for thirty-five years.

The Mohegan, like other Connecticut tribes, initially resisted English religion and culture. But gradually, as the land filled with colonists who reshaped the environment and economy, these Native Americans began adopting Anglo-American ways. Some became interested in Christianity, particularly after 1740, when the Great Awakening offered a sense of spiritual equality and renewal. Several graduated from Eleazar Wheelock's Indian school, including the famed Samson Occum, who became a tribal leader.

By the mid-eighteenth century, festering political conflicts and the religious awakening drove a growing wedge between conservatives and reformers, resulting in the division of the Mohegan into two villages, Johnstown and Benstown. At the former, men led by Occum began to build farms, fence land, and plow fields. Both groups called public meetings and wrote petitions to the legislature to discredit their opponents, weakening the tribe overall.

In spring 1773 came the final rejection of the tribe's land case, and Occum and other Native American reformers began to lay plans for a new community among the Oneidas in New York. While the war interrupted their plans, afterward many left for Brothertown. Only 200 Mohegan remained in Connecticut by 1790, when the last 2,300 acres they controlled as a tribe were divided up into individual plots for families.

Montcalm, Louis-Joseph (1712–1759)

Louis-Joseph, marquis de Montcalm-Gozon de Saint-Véran, was born February 29, 1712, at Château de Candiac, his family's estate. Of a distinguished lineage of military men, Montcalm received a strong classical education as a youth before joining his father's regiment in 1727. With delicate health as a child, Montcalm grew robust, though of slight build, as a soldier. He first saw action in 1733 at the sieges of Kehl and Philipsburg.

In 1735, his father died, and Montcalm, the only heir, returned to Candiac to manage the estate between campaigns. He married Angélique-Louise Talon de Boulay in 1736, and they had ten children, six of whom survived childhood.

During the War of the Austrian Succession, Montcalm served as a captain in Bohemia in 1741, where his meritorious service earned him appointment as a Knight of St. Louis. Later, as colonel of the Auxerrois Regiment in Italy, he was badly wounded and captured by the Austrians at the Battle of Plaisance (Piacenza) in 1746. Upon his parole in France, Louis XV promoted him to brigadier general. In a later battle, he was again wounded, but recovered, and after the Peace of Aix-la-Chapelle in 1748, he returned to Candiac and his wife, children, and mother, with whom he maintained a strong attachment throughout his life.

On January 25, 1756, Louis XV appointed Montcalm as commander of North American troops. Though not the most brilliant or heralded general in France, Montcalm was a proven, experienced, and competent professional officer. Passionate and quick-tempered, he was also quick to regain his composure, and calm and courageous in battle. He sailed from Brest at the head of nearly 1,200 French regulars on April 3, arriving in Canada on May 13.

Louis-Joseph, marquis de Montcalm-Gozon de Saint-Véran, commander of French troops in North America, defeated the British in several key battles early in the French and Indian War. But his loss at the Battle of Quebec in September 1759—in which he was killed—signaled the end of French rule in Canada. (Library of Congress, LC-USZ61-239)

Once in North America, Montcalm maintained a tense, combative relationship with Governor-General Pierre de Rigaud de Vaudreuil de Cavagnial, marquis de Vaudreuil. Vaudreuil and Montcalm came into conflict over strategy and the proper use of colonial militia and their Native American allies. Montcalm disdained the discipline and fighting character of the colonial militia, and he distrusted the Native Americans. He adhered to a European view of civilized warfare and considered the natives' styles of warfare as uncivilized, barbarous, and lacking in strategic soundness. His failure to take advantage of Native Americans' talents and skills, so successful in the North American wilderness, severely hindered French attempts to maintain a substantial presence on the continent.

Shortly after landing in Canada and marshaling his forces, Montcalm dispatched troops and trusted subordinates to defend Forts Carillon, Frontenac, and Niagara on the Canadian frontier in order to allow him security to assume the offensive. In his first campaign, he captured Oswego on August 14, 1756. He then attacked Fort William Henry, at the foot of Lake Champlain. Using European siege tactics, he forced the fort to capitulate on August 19, 1757. Perhaps his most glorious victory occurred at Ticonderoga on July 8, 1758, when his greatly outnumbered troops, well fortified in trenches and behind an elaborate abatis, delivered a crushing defeat to 15,000 British soldiers.

In 1759, while overwhelming British forces captured outlying French forts, Montcalm consolidated his greatly outnumbered troops at Quebec. Situated high on bluffs overlooking the river, Montcalm skillfully repulsed several assaults ordered by British General James Wolfe. From June 28 to September 12, the

French frustrated British attempts to take the city. Montcalm hoped to keep the British at bay until the onset of Quebec's early winter forced them to withdraw. He wished to avoid an open-field battle, because he recognized the disciplined, highly trained British Redcoats had an enormous advantage over his mélange of provincial troops, Native American allies, and assorted French regulars.

On September 13, in a clever maneuver, the British sailed past Quebec and scaled the heights behind the town. At dawn, Montcalm learned to his dismay that nearly 4,500 British troops were arrayed in line of battle on the Plains of Abraham in the city's rear. Because the British cut off his supply lines, Montcalm had to meet them in a field battle. Failing to wait for potential reinforcements from his aide, Bougainville, who had 3,000 troops a few miles in the British rear, Montcalm attacked impetuously and suffered a decisive defeat.

As he tried to rally his retreating troops at the city's gate, Montcalm was mortally wounded in the groin and leg. He died the next morning. Quebec formally surrendered on September 18, hastening the end of French resistance in North America.

Montezuma II (1466–1520)

The last ruler of the Aztecs, Montezuma II ruled over an empire that was at the height of its power when he ascended to the throne in 1502. Seventeen years later, Montezuma II greeted the Spanish conquistador Hernando Cortéz at his capital Tenochtitlán. After attempting to buy off Cortéz, he was imprisoned by the Spanish conquistador and eventually killed by his own people (so Spanish accounts tell it), ending his reign and causing the downfall of his empire.

The Aztecs had migrated to the valley of Mexico following the fall of the Toltec Empire in the late twelfth century, founding their capital at Tenochtitlán in 1325. Over the next two centuries, the militaristic Aztec gradually conquered much of modern-day Mexico and northern Central America, forcing other native peoples to pay tribute or face destruction.

Technically proficient, highly organized, and adept militarily, the Aztecs also were much resented by their subject peoples. The Aztecs ruled over an uneasy empire and their religion reflected that fact. Periodically, they engaged in invasions against other peoples to obtain human sacrifices to propitiate gods, who constantly threatened to bring down destruction on the empire.

Montezuma II, the ninth emperor of the Aztecs, ascended the throne upon the death of his uncle in 1502. Like many of his predecessors on the throne, Montezuma II was commander of the empire's army and led many of its expeditions against neighboring peoples. He also was a highly religious man and had a fatalistic streak. When Cortéz arrived in 1519, Montezuma II may have believed him to be an incarnation of Quetzalcoatl, an Aztec god who, legend had it, would be white, hirsute, and come from the east. The bearded Cortéz fit the bill, and Montezuma II lavished great gifts on him in hopes of winning the man-god's favor.

Suspicious of a trap, the Spanish conquistador had Montezuma II imprisoned and forced the Aztecs to offer even more treasure. When Cortéz abandoned the capital to fight off a rival Spanish expedition in early 1520, the Aztecs rose up; however, they were subsequently reconquered, and their capital was destroyed.

By seeming to have subjected himself so easily to such a small force of Spaniards—Cortéz commanded but 300 or so men, along with about 1,000 native allies—Montezuma II lost the respect of his people. While trying to rally them against Cortéz during the latter's absence in June 1520 (again, according to Spanish accounts), Montezuma II was attacked with spears and arrows. He died three days later.

Montreal

Montreal, Canada's second largest city, is located in the Hochelaga Archipelago in southern Quebec, near the confluence of the St. Lawrence and Ottawa rivers. When the first Europeans arrived in the sixteenth century, the Huron inhabited the region, including a village on the island of present-day Montreal, which they called Hochelaga. The Huron were hunters and farmers, living in long bark-covered houses and surviving on fish, beaver, and deer, as well as corn, squash, and beans.

In 1535, the French explorer Jacques Cartier, while searching for a Northwest Passage to the Orient, came across the island of Hochelaga, and the Huron led him to the top of a small mountain. Cartier named it Mont Royal and planted a cross in honor of King François I. Cartier later returned to France. In 1611 the explorer Samuel de Champlain, who thought about establishing a colony or trading post on the island, abandoned the project after hostilities broke out between the Huron, Algonquin, and Iroquois.

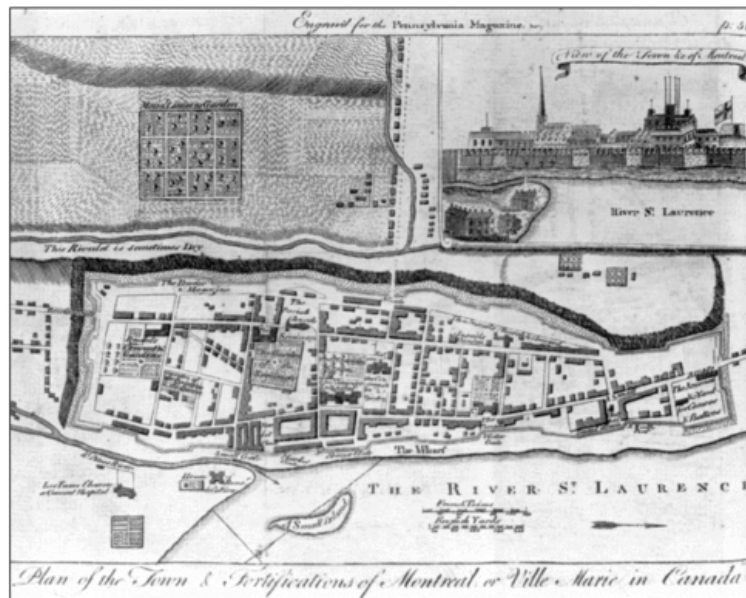

In 1642, Paul de Chomeday, Sieur de Maisonneuve, and forty colonists arrived in New France and founded a colony on the island, which they first called Ville Marie and later renamed Montreal. Under the direction of the Société de Notre Dame, Maisonneuve and his fellow colonists also sought to convert Native Americans in North America to Catholicism. In the early years, the settlement suffered many hardships, largely from Iroquois raids. With the growth in the fur trade in the seventeenth century, it became an important trading center and gateway to the western interior of Canada. Fur traders converged on Montreal, using it as a hub for exploring and establishing trading posts in the Great Lakes area and the Mississippi Valley.

At first, New France was governed by a private company, but, in 1663, King Louis XIV took possession of the French settlements, including Montreal, and declared New France a royal colony. While natives had originally brought pelts to European trading centers, the liberalized laws governing the fur trade that were enacted in 1652 had led to the emergence of a new class of European voyageurs, otherwise known as *coureurs de bois* (woods runners), whose numbers were ever increasing during the second half of the seventeenth century. With the emergence of the *coureurs*, the supply of furs quickly outgrew European demand, and Louis XIV was forced to limit the number of annual *coureur* outings from Montreal and other French settlements in 1681. In 1696, he made another attempt at curtailing the supply side of the market and issued a decree restricting trade to settlements along the St. Lawrence River.

In the eighteenth century, Montreal continued to prosper as the center of the fur trade. By the start of the French and Indian War in 1754, the city had about 4,000 inhabitants of French descent.

Under the command of General James Wolfe, the British defeated the French army on the Plains of Abraham at Quebec City. Having retreated to Montreal, where the British forces surrounded them, the French surrendered the city, with little bloodshed, in 1760. Three years later, after signing the Peace Treaty of Paris at Montreal (1763), they relinquished the city and the rest of French Canada to the British, who renamed the former French colony the province of Quebec. Under British rule, the French retained their laws, religion, and language and developed a unique cultural identity within this British colony.

In the third quarter of the eighteenth century, tensions between the American colonists and the British came to a climax. In November 1775, the Americans sent two military expeditions into the Province of Quebec in the hope of winning French support for the Revolutionary cause. While Benedict Arnold laid siege to Quebec City, General Richard Montgomery marched down the Richelieu River and captured Montreal. French support for the American cause, however, did not materialize. After a failed diplomatic mission, which included Benjamin Franklin, Samuel Chase, and Charles Carroll, the Americans left the city on June 6, 1776. For the remainder of the war, Montreal and the rest of French-speaking Canada were allied with the British cause.

Montreal was founded in 1642 as Ville Marie on an island in the St. Lawrence River. It was renamed in the seventeenth century for Mont Royal, around which it had been expanded and fortified. (Library of Congress, LC-USZ62-45558)

After the Revolution, Montreal prospered as a French and English city within the British Empire. The British North America Act of 1867 established the Canadian confederation of united provinces under a self-governing Canadian Parliament. Montreal emerged as the second-largest city in Canada and the city with the largest French-speaking population outside of France.

Murray, Judith Sargent (1751–1820)

Judith Sargent Murray helped establish the first Universalist church in America, but she is best known for her discussion of gender roles and advocacy of expanded economic, social, and political opportunities for women. She was a noted poet and essayist in an era when women rarely published.

Born in 1751 to a prosperous and socially prominent merchant family in Gloucester, Massachusetts, Judith Sargent displayed signs of great intelligence at a time when women were valued more for beauty and social charms than brains. She read widely, including the work of female authors gaining popularity in Europe, and toyed with the idea of becoming a professional writer. Although she sought to improve her mind by obtaining an education in the classics, her parents insisted that she instead learn traditional female arts like cooking and sewing, a decision that left her angry and embittered. In 1769, Sargent married merchant John Stevens and, in 1776, joined him in becoming involved with the controversial Universalist religious movement.

Sargent held to the Puritan religion of her ancestors until the new faith of Universalism emerged with an egalitarian message that gave her a framework in which to define and defend her belief that men and women were spiritual and intellectual equals. While Universalists believed that all humans were tainted with sin, they stirred controversy by challenging the notion of predestination. All people would be saved from damnation, not just a select few, because Christ had died for the sins of everyone.

Writing in 1776, she argued that if God did not differentiate between men and women, then differing gender definitions were mere artificial constructions. In January 1778, she signed the articles of association creating the first Universalist church in America, thereby inviting the scorn of most members of the Gloucester community. Her steadfast belief in God's support of her actions meant that this criticism, though severe, had little personal impact upon her.

Sargent's rejection of the established church led her to question other social and intellectual conventions. As she subsequently declared, any argument based on "the despotism of tradition, the prejudices of education, and the predominating sway of revered opinions" was never again quite as persuasive. Once Sargent defied her community over the explosive topic of religion, she found it easier to take issue with other concerns, especially when she was convinced that she was acting in accordance with God's word.

Encouraged by other Universalists, especially Reverend John Murray, to share her thoughts on gender relations, she began to write for a public audience. By 1784, she regularly sent essays and poems to a select number of New England magazines, but she remained uncomfortable about becoming a public woman and nodded to conventional mores by employing the pseudonym Constantia. Sargent wrote on a wide variety of subjects, often discussing politics, manners, religion, marriage, the education of women, women's attributes as breadwinners, and motherhood.

Sargent's life changed dramatically as her husband's business gradually failed because of the poor trading conditions during the American Revolution. A tepid patriot who was shocked at the lack of civil liberties accorded loyalists, she now had another reason to dislike the conflict. Most New Englanders of this time considered financial setbacks to be evidence of moral failure, and a humiliated Sargent became too ashamed to appear in public. Stevens attempted to resuscitate his career but died in 1787 before doing so.

John Murray, an old friend and the man most responsible for bring Universalism to America, had been boarding in the Stevens household, and Judith married him in 1788. After losing a son in infancy, she bore a daughter in 1791 who survived to adulthood.

Murray encouraged his wife to publish, and, in 1795, under her own name, Judith Sargent Murray began a short-lived career as a playwright with two comedies, both of which appeared briefly on the stage in Boston. In 1798, she published *The Gleaner*, a three-volume collection of her writings that included both old and new essays, as well as poems and both of her plays.

Following her second husband's death in 1815, Murray published her last work, *Life of John Murray, by Himself: With a Continuation by Mrs. Judith Sargent Murray*. She died at her daughter's home in Natchez, Mississippi, in 1820.

Music

Refined, "high culture" music along European lines was a very late arrival to the seaboard cities of colonial British America. Instead, early music in Colonial America was a musical patchwork, as each native and immigrant culture contributed its own musical sensibilities, instruments, and styles.

These various musical traditions affected each other in countless ways. Yet, by 1776, it would still be difficult, if not impossible, to identify a unique, unified, American musical style. It makes more sense to imagine a number of loosely affiliated American "musics" at the crossroads of three continents: America, Europe, and Africa.

Native Music

Native American culture before and during the colonial period was predominantly oral. Music was passed from generation to generation in much the same way as were religion and other cultural forms. Indeed, the divisions between religion, artistic expression, and everyday life among many native peoples were not nearly as sharp as they were among the newcomers from Europe.

Most of the written accounts of early Native American music come from the biased writings of European observers. Early accounts, whether from Cabeza de Vaca in the Southeast or Le Jeune in Huron country, vary widely in their assessments of native music. Interestingly, in their range of descriptions—from savage, chaotic, and wild to unrefined yet graceful—accounts of native music parallel European ideas about native peoples themselves.

One thing is clear from oral traditions across the centuries and written accounts alike: music was, and remains, fundamentally important to Native Americans. Its performance has traditionally accompanied major life events, religious ceremonies, and more mundane activities as well.

Each individual native community used music in ways that reflected that particular group's historical experiences; some songs were even the property of certain tribal members or clans and reserved solely for their use. Music was sung and played on flutes, trumpets, gourds, and drums. Often, the tones being sung indicated the meaning of the songs, sometimes in conjunction with words, sometimes not.

By their very nature, the myriad musical cultures of North America were extremely adaptable to change. Thus, Native American music today reflects centuries of interaction with European and African music, while, at the same time, remaining a marker of identity and strength for indigenous peoples throughout North America.

Religious Influences

The first European music in the Americas expressed the dual economic and religious nature of the project of colonization. At the same time as soldiers, sailors, farmers, and traders brought early music emphasizing secular themes, Spanish and French missionary activities brought European religious music to the colonies.

Roman Catholic worship in the sixteenth through eighteenth centuries stressed routine, and services were designed to impress native and nonnative parishioners alike. Early in establishing their missions, priests worked hard to incorporate native choir members into religious services. By 1528, natives were singing Latin hymns in and around Mexico City; similar services, though on a much less grand scale, were taking place in Spanish Florida by the late 1550s and early 1560s. Mexico City, with its massive cathedral, became a center of religious music in the Americas for both Native Americans and Spanish.

Although the French and Spanish colonial aims and destinations were different, a similar musical pattern developed in New France. French missionaries, however, were willing to incorporate native cultural forms into their services to a greater extent than the Spanish.

The first English settlers in America were not particularly interested in spreading their various sects of Protestantism to adjacent Native American communities. In New England, music was a matter of individual and community spiritual health. In Plymouth and the Massachusetts Bay Colony, colonists sang God's praise from a very small variety of psalters.

Disputes occasionally arose over the proper translations of religious texts, and the Puritans, ever legalistic, would not tolerate license with the scriptures. One result of these disputes was *The Whole Booke of Psalmes Faithfully Translated into English Metre*, also known as the *Bay Psalm Book*, which was published in Cambridge, Massachusetts, in 1640. Various incarnations of the *Bay Psalm Book* were in use well into the eighteenth century.

Puritans "lined out" their hymns, mainly in unison, with one singing leader calling out the lines and the congregation echoing them. Eventually, a schism developed between "lining out," or "Old Way" singing, and "Regular Singing," simply singing the songs as written. Old Way singing faded from the scene exceedingly slowly, and variations existed in remote territories into the twentieth century. As Regular Singing rose to prominence, singing schools developed, and soon, choirs began to form. By the end of the colonial period, the American colonies had begun to produce composers, the most notable of whom was Boston's William Billings.

Not all Anglo-Americans were of a Calvinist bent, and Anglicans, whose carefully prescribed liturgical calendar resembled that of the Catholics, contributed a great deal to colonial American music. The Anglicans were not opposed to the great expense of church organs, nor to hiring expensive professionals from Europe to play them. Particularly well-off Anglican churches spared no expense: Charles Theodore Pachelbel, son of the great Johan Pachelbel, played at St. Philip's in Charles Town, South Carolina, from 1737 to 1750.

German-speaking Protestants, with none of the worries of the Puritans concerning elaborate arrangements or the corrupting effects of musical instruments, also transported an elaborate musical culture with them from continental Europe. They disseminated their music throughout the areas in which they settled.

Music at Home and on the Plantation

Not all early American music was religious in nature. Each cultural group had its own folk music, and these songs, some of which are still around today, accompanied the home and social lives of white colonists.

The British Isles, for instance, had an ancient tradition of ballad singing, which made its way across the Atlantic and was dispersed throughout the backcountry. Sometimes, ballad writers would alter lyrics to ancient tunes to make them more relevant to life in America; "The Trappan'd Maid" complained about a servant's lot in Virginia, for instance.

American events also formed the subject matter for songs like "The Death of General Wolfe," which celebrated the sacrifice of the hero of the French and Indian War. Fiddle tunes and dancing music, almost entirely imported from Europe, also lightened many of the burdens associated with rugged colonial life.

The peoples who encountered one another in colonial North America all underwent a cultural transformation. Perhaps none was as significant as the transition of various groups of Africans into African Americans over the span of several generations. One of the ways in which diverse African peoples established an identity that allowed them to survive and thrive culturally under the most miserable physical conditions was music. African cultures were not destroyed by the Middle Passage and slavery. Instead, they were broken down, altered, and rebuilt in an effort to form a new African American cultural identity, of which music was a crucial part.

The music made by black Americans varied widely from region to region. Throughout North America, Africans took up European instruments such as the violin and French horn, although they modified the instruments and the way they were played to their own musical ideas. African slaves also made drums, flutes, xylophones, and other instruments, including a predecessor of the modern banjo, much the same way as they had in Africa. A uniquely African American form of fife-and-drum music is still performed today.

Skilled African musicians entertained at social events for their masters, but also for members of their own community. African slaves used music and dance to express their feelings about the institution of slavery, their masters, and a variety of life experiences. Perhaps the most famous African American contributions to early American music are the work song and the spiritual. Some of these satirized the cultures of the colonies' elite. Many used the call-and-response patterns familiar to students of black music throughout the transatlantic world. African Americans farther to the north fell under the influence

of Anglo-American musical forms to a greater extent than their Southern cousins.

In the middle of the eighteenth century, elites in colonial America began to undergo a process that some scholars call refinement. In colonial cities on the Eastern seaboard, well-to-do Americans began to emulate European culture, and music was one of the areas they found lacking. Over the course of the eighteenth century, concerts and the places in which they were performed became increasingly elaborate.

A class of professional composers and musicians was slow to develop in colonial America. Still, colonial Americans of every race and ethnicity made music and performed it in a variety of secular and religious settings.

Natchez

Located on a high bluff overlooking the lower Mississippi River in present-day Mississippi, colonial settlement at Natchez existed on the far fringes of the colonial Atlantic world. Consequently, claims to Natchez and its surrounding hinterlands shifted between Native American and European powers through the eighteenth century. In 1798, the United States incorporated "Natchez Country" into the newly formed Mississippi Territory.

The Natchez Indians who inhabited the bluff were descendants of larger, more centralized nations of the lower Mississippi Valley, which had fragmented into a host of smaller tribes and nations in the 1500s because of disease, warfare between native peoples, and Spanish raids. Like other native nations in the lower Mississippi Valley, the Natchez engaged in mixed agriculture, hunting, and the small-scale trading of deerskins. In the late 1600s, English traders operating out of Charles Town, South Carolina, arrived in the area. This led to a dramatic growth in the deerskin trade and intense competition between Native Americans, who now sought to expand their hunting grounds at the expense of their rivals.

In 1714, French colonial officials made a concerted effort to erect a settlement, fort, and trading post at Natchez to expand their influence in the lower Mississippi Valley. Strategically located between Canada and the Illinois Country to the north, Louisiana and the Gulf Coast to the south, and the Native Americans and fur trade of the lower Mississippi Valley, Natchez became an important trading center in the 1720s. Over 300 Africans, many of whom were slaves, 400 Europeans, and perhaps 1,600 Natchez Indians lived in Natchez during this period. Joining them were scores of native and European traders, who periodically met at Natchez to barter and exchange. In addition to the nearly 50,000 deerskins passing through Natchez annually in the mid-1720s, the Natchez District's mixed population produced substantial quantities of wheat and tobacco, along with smaller amounts of rice, indigo, cotton, tar, and silk for exchange at Natchez or downriver in New Orleans.

In 1728, Sieur Etcheparre De Chepart, an ambitious commandant, assumed command of the French fort at Natchez. Relations between the French and the Natchez rapidly deteriorated after Chepart ordered the natives to evacuate a village where he planned to establish a tobacco plantation. A group of Natchez chiefs negotiated a settlement allowing them to remain in their village until harvest. To show their gratitude, they promised that each family would provide the French commandant with a "basket of corn and a fowl" at the end of the harvest.

The Natchez then quickly laid plans to revolt against the French and drive them from the area. With the assistance of African slaves, the Natchez planned to "cut off the French to a man." On November 28, 1729, the Native Americans arrived in Natchez—ostensibly to pay tribute to the French commandant. At day's end, 145 Frenchmen, 36 women, and 56 children lay dead, while 300 African slaves and 50 French women and children became Natchez captives.

This massacre effectively ended French plans to build plantations around Natchez. It also led to the demise of the Natchez people by the 1740s. The French joined with the Choctaw nation—who welcomed the chance to destroy this rival—to wage war against the Natchez Indians, forcing them to give up their settlements around Natchez. By the 1740s, the French and Choctaws had effectively destroyed the Natchez.

After the Natchez Rebellion, the settlement on the bluff remained sparsely inhabited. From the 1730s through the 1750s, most of the French colonists in the lower Mississippi Valley lived between New Orleans and Point Coupee to the south. The French maintained a garrison of fifty or so troops among the roughly fifty families who remained at Natchez. Native and European traders sometimes traded with the soldiers and settlers, but the small settlement remained but a shadow of the thriving trading center of the 1720s.

In 1763, Britain gained control of Natchez from the French as a result of the Great War for Empire, incorporating the region into the province of West Florida. The British offered large land grants to encourage settlement, and the Anglo-American and enslaved African population around Natchez grew steadily. With the onset of the American War for Independence, the British encouraged loyalists to settle around Natchez, and many brought slaves with them. By 1780, perhaps 5,000 loyalists and 1,200 slaves inhabited Natchez and the surrounding plantations.

In 1783, Spain claimed control of the disputed Natchez region under the Treaty of Paris. Hoping to counteract American claims on the region, the Spanish encouraged American settlement and loyalty to the Spanish government by providing generous land grants, bounties for staples such as tobacco, and free access to the slave trade. Under Spanish rule, Anglo-American planters laid the groundwork for the rapid expansion of a plantation society. The introduction of Eli Whitney's cotton gin in 1793, which Natchez planters copied in 1795, spurred this expansion.

The 1795 Treaty of San Lorenzo ceded the lands north of the 31st parallel to the United States, bringing Natchez and the newly created Mississippi Territory under American control in 1798. The plantation economy around Natchez grew steadily, though Choctaw resistance, the constant threat of war and disorder from the Spanish and British, and uncertainty over land claims slowed the migration of American planters. American victory in the War of 1812 weakened the native nations of the old Southwest, while solidifying American power in the lower Mississippi Valley.

After 1815, planters from the Atlantic states poured into Natchez and the Mississippi Territory. The expansion of their plantations finally led to the forced removal of the Choctaws in the 1830s, during the presidency of Andrew Jackson. By then, Natchez's stately mansions, thriving slave markets, and grand plantations had made it the epitome of the antebellum cotton kingdom.

Native American-African American Relations

The centuries-long interaction between African Americans and Native Americans is one of the least researched and least understood chapters in American race relations. Native American-African American relations in the West, particularly in the nineteenth and twentieth centuries, have been the subject of serious scholarly inquiry. The colonial period, however, remains woefully understudied as compared to ethnic divisions within the white population, African-European relations, and interactions between Native Americans and European Americans.

Africans were among the earliest explorers of North America. Esteban, a slave in the service of the Spanish, accompanied Cabeza de Vaca on his overland journey from Florida to Mexico. In fact, Africans accompanied nearly all of the Spanish expeditions through the American Southeast. They served as slaves alongside Tainos on Hispaniola as early as 1510. Native Americans and Africans also worked side by side in the mining operations of Spanish Mexico.

Outside of Latin America, the North American Southeast was the only place where large numbers of Africans, Native Americans, and Europeans came together for an extended period of time. The attitudes of Native Americans toward African Americans varied widely, from friendliness to tentative acceptance to outright hostility, depending on the tribe and the historical context of the contact. For example, in 1752, Catawbas expressed great resentment at the presence of a single African American in their nation. Native Americans were also employed as a sort of police force, keeping Carolina's growing slave population from running away to Spanish Florida and freedom.

From the earliest European explorations and slave imports, Native Americans and Africans came together in large numbers. While little studied by historians, relations between the two groups are known to have included marriage, as between this African American man and native woman in Mexico. (Museo de America, Madrid, Spain/Giraudon/Bridgeman Art Library)

In many cases, whites tried to keep Native Americans and African Americans separated, fearing that Native Americans could turn African Americans against their white owners and that African Americans could interfere with their plans to dominate the local native tribes. In addition, in many places, such as South Carolina, an English minority coexisted with large populations of Native Americans and African Americans, both of which had justification to hate the English. So it made good political sense to separate the two as much as possible. In 1758, outgoing South Carolina governor James Glen explained to incoming governor William Lyttelton that "it has always been the policy of this government to create an aversion in them [Native Americans] to Negroes."

In spite of white attempts to separate them, Native Americans and Africans, particularly in the Southeast, did form bonds, whether through intermarriage or through shared work experience. The segregationist policies of the late nineteenth and twentieth centuries, however, have made relations between African Americans and Native Americans even harder to uncover. Southern Native Americans, already suffering from racial prejudice, did not wish to be subjected to Jim Crow laws and went to great lengths to prove that they were not of African ancestry.

The best place to look for the relationship between Africans and Native Americans is in colonial slave quarters. During the early years of English colonization, most African imports were men, while the typical Native American slave was a female. One early colonial tract boasted that a man of modest means could succeed in Carolina with 150 acres of land, one male African slave, and one female Native American slave. Since the Church of England rarely sanctioned slave marriages, whatever the ethnicity of the parties, records of Native American-African intermarriage are few and far between. The English did use the term "zambo" to describe the offspring of these unions.

The cultural influence of Native Americans on African Americans is hard to gauge, especially in cases where similar practices—such as making baskets and canoes—existed in both cultures prior to contact. But Africans brought rice culture to the American South, and, in doing so, changed the diet and agricultural practices of Native Americans. In return, some types of foods that today fall under the category of "soul food," such as grits and corn bread, can be traced to Native Americans, as can a wide range of folk medicines made of native plants and animals. In addition, excavations on slave cabins have unearthed an astounding array of artifacts of both Native American and African origins, such as pipes, bowls, and beads, which indicate an expansive exchange of material culture.

Some Native Americans, particularly the Creek and Cherokee, owned African slaves, although the practice was never particularly widespread. Some groups, such as the Seminole of Florida, did not force African slaves to labor on plantations, but rather allowed them to live in autonomous communities so long as they paid tribute to the Seminole. Interracial communities (also known as "triracial isolates"), which blended African American, Native American, and white heritages, such as the Shinnecock, Montauk, and Mashpee in the North and Lumbee, Melungeon, and Brass Ankle in the South, further testify to the lasting interaction between these groups.

Though the history of African-Native interaction has yet to be written in any comprehensive way, the preliminary findings threaten to change traditional conceptions of colonial life. One of the main shifts will likely be the recognition that, in addition to maintaining cultural practices from West Africa, African slaves in the Southeast were profoundly influenced by Native Americans.

Native American-European Conflict

Although Europeans and Native Americans interacted in many different ways over their centuries of colonial contact, the most striking and, arguably, the most pervasive was in the context of warfare. Colonial wars touched every part of North America east of the Mississippi and occurred from the beginnings of European colonization in the Caribbean and Mexico through the era of the American War for Independence.

Sixteenth Century: Wars of European Conquest

Native American-European conflicts in the 1500s were generally affairs of military conquest, but, on occasion, smaller conflicts broke out. Trade, which would become a leading cause of conflict between cultures in the centuries to come, was not really a factor at this early date.

The most famous conflict of the sixteenth century was Hernando Cortéz's conquest of central Mexico between 1519 and 1521. Cortéz had superior technology in the form of muskets, but their effect in combat was extremely limited, especially when facing an enemy as numerous as the Aztec people. Rather, Cortéz owed his success to the alliance of other enemies of the Aztec, particularly from the city of Tlaxcala. Epidemic diseases from Europe that swept through Tenochtitlán also aided the Spanish. After initially being repelled by a superior Aztec force, Cortéz regrouped and returned, conquering the Aztec easily.

Other campaigns conducted farther to the north were much less spectacular, perhaps because other Spaniards failed to follow Cortéz's lead. Juan Ponce de León—in search of gold, slaves, and a magical "fountain of youth"—landed near Tampa Bay with only a small party of Spanish invaders (without the aid of native allies) and was promptly shot. He returned to Cuba, where he died of his wounds.

Similarly, Hernando de Soto wrought havoc throughout the southeastern portion of what would later become the United States. He succeeded in spreading disease and terrifying native populations wherever he went, but he failed to find much treasure and lost his life in the process. Native peoples, most of whom still fought in a style reminiscent of the Mississippians (limited goals and prolonged skirmishes, with a heavy emphasis on surprise), succeeded in pushing the explorer out of their respective territories. A pitched battle took place at Mabila, a fortified town in central Alabama in 1540. While the Spanish suffered many casualties, they did manage to repel a force of Tuscaloosas.

An etching from the 1580s (based on the first-hand account of colonist John White) depicts the Native American village of Pomeiooc near the Roanoke settlement. While surrounded by poles stuck in the ground, native settlements in the region were poorly fortified and vulnerable to attack. (Brown Brothers, Sterling, Pennsylvania)

Francisco Vázquez de Coronado encountered similar problems in his expedition into the American Southwest. Unable to find gold or allies, he marched as far north and east as Kansas but was forced to return with little to show.

It bears mentioning that the Spanish rarely intended genocide. They would have preferred that Native Americans remain alive and labor for them in mines, missions, and farms. Unfortunately, disease, warfare, slavery, and dislocation disrupted native lifeways so severely that genocide was often the result. The clearest example of this was the island of Hispaniola, which may have boasted a population of millions before the Spanish invasion. After less than a century of colonization, it was left with a native population of zero.

1600 to 1675: Wars for Trade and Territory

In the 1600s, new forms of violence erupted for new reasons. Trade became increasingly important as a cause of war. Also, in North America, Native Americans and Europeans, particularly the English, had begun to compete for land and resources. Over the course of the seventeenth century, conflicts flared in Canada, Virginia, and New England. The Southeast experienced a slightly lower level of violence, if only because smaller numbers of Europeans had settled in the region. Pennsylvania's frontier also largely escaped violence because of small native populations and the diplomacy of William Penn in the colony's earliest years.

From 1603 to 1615, Samuel de Champlain established alliances with the Huron in the St. Lawrence Valley, believing that both groups could profit from the fur trade. He was right, but his actions had deadly consequences for the Huron. The Iroquois, who were becoming the major military power in the region (especially after they had been armed by the Dutch), conducted a series of operations in Huronia in the 1640s that almost entirely eliminated the Huron.

Like most people, the Iroquois also went to war for cultural reasons. Through "mourning wars," the Iroquois sought to avenge the deaths of relatives and clan members who had been victims of war or disease. Often, captives were adopted into the Iroquois tribe. In the "Beaver Wars," the Iroquois killed many Hurons, adopted many, and sent the remainder fleeing to the Great Lakes region. As a result of the conflict, the Iroquois became the preeminent Native American group in the Northeast.

The Powhatan in Virginia encountered a different kind of enemy. In the late sixteenth and early seventeenth centuries, Powhatan, a paramount chief, had come to control most of the eastern half of Virginia through diplomacy and intimidation. In 1607, the English appeared at Jamestown, and Powhatan adopted them, he believed, as another tributary village. The English, however, did not recognize this and began to settle outside of the area given them by Powhatan; they also pressed native means of subsistence by stealing corn and other resources. In order to teach the English how to behave, the Powhatan conducted a series of raids from 1610 to 1614. More serious conflict erupted in 1622 and 1644, when the Powhatan (in these cases, under the leadership of Opechancanough, Powhatan's brother) again tried to stop English expansion and curb English abuses. In these conflicts, the English used the attacks as pretexts for wars of extermination. What they lacked in military power they made up for in cruelty.

In New England, the English settlement at Plymouth in 1620 posed little threat to Massasoit, the Wampanoag leader, and, for a time relations in the area were peaceful. But the settlement of tens of thousands of zealous Puritans on Massachusetts Bay in the decades that followed presented a more significant threat.

Tensions flared in 1636 and 1637 in the Connecticut River Valley. The Pequot had been among the more powerful native groups in the region but had fallen on hard times and run afoul of the English, who were spreading into the valley to trade and farm. This proved a lethal combination, and the

combined forces of Plymouth, Massachusetts Bay, the Wampanoag, and the Narragansett attacked the Pequot. The main action involved the wholesale slaughter of 500 to 1,000 Pequot noncombatants at a fort on the Mystic River in 1637. Puritans horrified their allies by setting fire to the fort and killing men, women, and children as they ran out. The treaty that stopped the war provided for the remaining Pequot to be dispersed among other tribes and sold into slavery. They were also no longer allowed to use the term "Pequot" to describe themselves.

The lessons of the seventeenth century were clear to both Native Americans and Europeans. Europeans, in most cases, had to use Native American allies to accomplish their goals of obtaining trade and territory. Native Americans, for their part, realized that they could not remain isolated and independent. They needed European firearms and therefore allied with one of the competing colonial powers in increasing numbers. The term "Indian war" does not apply to any of the conflicts over North America in the colonial period. The native peoples fought on both sides of these battles.

1675 to 1783: Wars for Survival, Wars for Empire

The end of the seventeenth century brought another major shift to conflict between Native Americans and Europeans. By this time, a permanent presence of Europeans on the Eastern seaboard of America had been achieved. As European power increased, Native Americans made tough choices about their allies, whom they would fight, and when they would fight—all with a mind to surviving the colonial onslaught. The battles over Virginia, New England, and the Southeast reflect this shifting colonial reality. As the eighteenth century progressed, England and France, and finally England's colonies, squared off against one another in a battle for the heart of North America.

Bacon's Rebellion has been portrayed as playing a number of roles in the drama of colonial Virginia. It has been cast as a race war, a battle over patronage, and a fight between the tidewater establishment and the underrepresented backcountry. Its relation to Anglo-Native American conflict is of more importance to the current discussion.

Virginia and its native neighbors had been at peace since the 1640s. Increased English settlement and disgruntlement among the native peoples exploded into a vicious war in 1675 and 1676. A group of Doeg Indians, upset with a crooked planter, began to attack white settlements on the frontier. Neighboring planters launched a retaliatory strike against the Doeg, but they killed some Susquehannocks (who had been allied with Virginia). The Susquehannock responded in kind, striking settlements on the western edge of Virginia and Maryland. Frontier planters, under the leadership of Nathaniel Bacon, raised a sizable army and began to attack any Native Americans they could find. The results were devastating, and though Bacon's Rebellion failed to reform Virginia government, it made one fact abundantly clear: Even if the king and the governor preferred peaceful relationships, colonists could annihilate Native Americans.

At approximately the same time as Bacon's Rebellion, King Philip (Massasoit's son, Metacom) was inspiring Native Americans to fight English encroachment, both physical and cultural, in southern New England. By 1675, the Puritans numbered 60,000 and had taken an increased interest in converting the native peoples to Christianity. Young Wampanoag men in particular had grown increasingly uncomfortable with the English. The years between 1637 and 1675 witnessed a lengthy period of peace between the English and the Wampanoag. In 1675, however, Metacom's forces attacked the English settlements at Plymouth. Soon, other native communities saw the chance to inflict pain on the English, and the conflict exploded into a regional war.

Native Americans dominated the early stages of the war, destroying a number of towns on the Massachusetts frontier. In 1676, food shortages, as well as an alliance between New York and the Mohawks, convinced most Native Americans to give up the fight. Metacom himself was killed in the summer of that year. This was basically the last gasp for the native peoples of southern New England. Many sought refuge among the Iroquois. Still others went to live in "praying towns"—early reservations set up for the purpose of Christianizing natives.

The Southeast, which had largely escaped conflict in the late seventeenth century, became a bloody battleground in the early eighteenth century. Native Americans found themselves wedged in between three European rivals. The crumbling Spanish Empire maintained a presence in the form of missions in central Florida and the Gulf Coast. The French controlled Louisiana, and the English at Charles Town had established a wide-ranging trade in deerskins, firearms, native slaves, and cloth.

In the early decades of the eighteenth century, several major wars broke out. The Tuscarora War (1711–1715) erupted when the Tuscarora, upset by the expansion of North Carolina, struck settlements along the Neuse River, killing 130 Swiss, German, and English colonists. Although North Carolina's colonial forces were unable to respond, South Carolina sent an army of 500 Native Americans and a handful of whites and African Americans to stop the Tuscarora. This attack succeeded in capturing slaves and plundering several Tuscarora towns. Later, in 1712, a larger force of Cherokees fighting with South Carolina defeated the Tuscarora. The defeated Tuscarora migrated northward to New York, where they became the Sixth Nation of the Iroquois in 1722.

In 1715, the Yamasee, and in fact most of the native peoples in the Southeast, launched a furious assault on South Carolina. The war began because English settlements were expanding and Carolina traders were driving the Yamasee more and more into debt. The Yamasee and Creek managed to drive the line of settlement to within 30 miles of Charles Town, but the English and their Cherokee allies fought back. The Yamasee retreated to the protection of Spanish Florida.

Imperial conflict began to reshape the Southeast early in the eighteenth century. Chickasaws who were allied with the Carolina traders fought French-allied Choctaws. Joint Carolina-native armies seriously weakened the Spanish mission system in 1704, when they burned Apalachee, its most prosperous province, and carried hundreds of mission natives off into slavery.

The Seven Years' War—which, in America, lasted from 1754 to 1763 and was known as the French and Indian War—expanded on earlier types of war, but it was also a new kind of conflict. Although the war erupted in America, it originated in London and France, where the two major imperial powers forced a showdown over North America, and it was fought all over the world.

The French had become worried that they were losing the continent of North America to Great Britain. In the 1750s, they and their native allies (mainly from the Great Lakes region) began to assault frontier outposts in the Ohio River Valley. These early attacks were a great success, and, by 1754, a joint French-native venture had established Fort Duquesne (present-day Pittsburgh). The British Empire struck back, though their initial attempts at retaliation

were ineffective. In 1755, for instance, a major British army was routed by a much smaller French and Native American force near Fort Duquesne.

Native Americans at the outskirts of Virginia and Pennsylvania seized the opportunity to block colonial expansion. At one point, the fighting ranged within about 30 miles of Philadelphia, the largest English city in America. To sum up, 70,000 French colonists and their native allies had attacked British North America, with a population of around 1.5 million, and had beaten them badly.

Native Americans played a crucial role in turning things around for the British. William Pitt, the new British prime minister, began to pour extraordinary amounts of money and resources into the conflict. The Iroquois, who had remained neutral, were persuaded to join the British. After 1759, the Iroquois-British alliance won major victory after major victory, taking Montreal and Quebec by the early 1760s and finally forcing the French to surrender their claim to North America.

The last "Indian war" of the colonial period was the War for Independence, and it was a disaster for Native Americans. A few groups sided with the Americans, but most native communities, sensing that an independent America would overrun what remained of their land, sided with the British. In the aftermath of the war, it made no difference what side Native Americans had fought on. The American Revolution spurred a new wave of white settlement in the Ohio River Valley, the Midwest, and the South, and this expansion brought with it a new wave of violence.

Native American-European Relations

Native America in 1500 was a stunningly diverse place. Native peoples had adapted to their environment for more than 10,000 years. They formed complex societies with their own worldviews, methods of exchange, and expressions of spirituality and art. Varying greatly in size, these societies included the small, kin-based communities of the Plains and autonomous villages in the Eastern woodlands; centralized mound-building cultures along the Mississippi and in the Southeast; and large tributary empires such as that of the Aztec in Mexico's central valley.

Europeans, who first arrived in significant numbers in the sixteenth century, brought sweeping historic changes to these native communities. However, the speed and depth of the changes varied enormously, depending on when, where, and under what circumstances Native Americans met Europeans. By the end of the eighteenth century, colonial America had been thoroughly reshaped by the interaction between diverse groups of Native Americans and Europeans.

Early Contact

Although some Native Americans—such as the Taino, Aztec, Timucuan, and Pueblo peoples—met European explorers face to face, many more groups experienced their early presence through new trade goods and the diseases brought unwittingly by the Europeans. Disease was a serious killer of Native Americans throughout the colonial period, but perhaps never more so than in the earliest years of contact. Some estimates place the population of North America north of the Rio Grande at 5 to 7 million in 1492. By 1900, this number was around 250,000.

While disease colored interaction between Europeans and Native Americans, it was not the only factor that brought about the precipitous decline in native populations. The short- and long-term effects of colonization—dislocation, war, and psychological trauma—should not be overlooked.

Early contacts between Native Americans and Europeans ran the gamut from peaceful trading partnerships to skepticism of each other's intentions and outright warfare. The Spanish were the first Europeans to take a serious interest in North America. Having successfully emerged from the *Reconquista* (their campaign to remove the Moors from the Iberian Peninsula), they demonstrated a burning desire to convert natives to Christianity at the same time as they exhibited a lust for conquest and treasure.

The first attempts by the Spanish to explore and colonize north of the Rio Grande can be seen as little more than a series of miserable failures. In Florida, Ponce de León searched fruitlessly for gold and slaves and was shot and mortally wounded by local natives in 1521. In 1528, Pánfilo de Narváez's voyage to the Gulf of Mexico ended in tragedy: most of his party died and a handful of survivors walked overland for six years until they reached Mexico.

The *entradas* of Francisco Vázquez de Coronado in the Southwest (1540–1543) and Hernando de Soto in the Southeast (1539–1542) were larger and more adequately funded. They fared slightly better but did not improve the sorry state of Native American-Spanish relations in North America. De Soto, for instance, would move through various chiefdoms in search of gold, taking headmen and women hostages, looting graves, and shooting resisters or throwing them to war dogs as examples. He faced not only constant harassment, but, in 1540 at Mabila (in central Alabama), he nearly lost a pitched battle to Tuscaloosa warriors. Coronado pushed his way through Pueblo country and reached western Kansas in search of mythical golden cities. Finding none, he battled his way back to Mexico.

If the Spanish were mainly concerned with extracting precious metals and using native labor to do it, the French were mainly concerned with removing another sort of wealth: beaver fur. Accordingly, early contacts with the French in Canada were somewhat less hostile. Jacques Cartier traveled up the St. Lawrence River from 1534 to 1541 and established a fur trade that would profit the French and the tribes that joined them for many years.

French traders, and later settlers, were overwhelmingly men. They established themselves in native communities and, with their native wives and partners, created a substantial number of biracial offspring, known in Canada as the Métis people. Although there were intimate physical relationships between Europeans and natives in all parts of North America, they were far more common in areas settled by the French and Spanish.

Planting Colonies and Missions

As the sixteenth century gave way to the seventeenth, Europeans came to America in increasing numbers and with a wider range of goals. For native-white relations, the most important of these was the founding of permanent European colonies in North America, often on the basis of religion. And as these settlements expanded, violence often erupted along their frontiers.

Under Juan de Oñate, the Spanish moved across the Rio Grande into Pueblo country in 1598. They established the colony of New Mexico at the intersection of two long lines of pueblos and spread out into the surrounding native communities. New Mexico had little to offer in terms of material wealth, but the densely populated area was of great interest to the Jesuits and, later, the Franciscans, who sought converts among the Pueblo. Although there were periods of peaceful interaction, mistrust and hostility were more common. Native leaders assumed, correctly, that the Spanish priests were trying to alter their traditional religions, and they often reacted violently. The Pueblo Revolt, a reaction against increased religious and secular supervision, drove the Spanish out of New Mexico between 1680 and 1693.

In the first decade of the seventeenth century, the French planted a colony at Quebec. Although the French did not become a large colonial presence in terms of settler population, they interacted with a wide range of Native American peoples through their fur trade and missionary activities. The Jesuits operating in New France, for instance, were slightly more tolerant of native religions and were able to win a large number of nominal converts to Catholicism. The Dutch, working out of New York, maintained basically friendly relations with Native Americans, particularly the Iroquois, because they wanted to cut into the French fur trade.

The English colonies in the Chesapeake and New England, both established in the first half of the seventeenth century, were more bent on dominating local native populations than converting them or engaging them in trade. Although trade networks did operate out of Plymouth, Massachusetts Bay, and Virginia and the colonists occasionally tried to convert Native Americans, these colonies were very different from their Spanish and English counterparts.

Early English efforts to colonize North America, such as that at Roanoke in the 1580s, were failures. In 1607, however, Jamestown was founded on the peninsula between the James and York Rivers, feeding Chesapeake Bay. The tiny group of colonists posed little threat to Powhatan, and relations were generally peaceful. After a few years, however, the colonists began to press local Native Americans for food and land, and violence ensued. From 1610 to 1614 and in 1622, 1644, and 1676, white Virginians battled their neighbors for control of the area's rich farmland. By 1700, Virginia was a wealthy plantation colony, driven by the labor of African slaves and the production of tobacco.

Similarly, Plymouth, founded in 1620, posed no threat and offered a potentially valuable ally to Massasoit, sachem, or chief, of the Wampanoag, so he welcomed the fledgling colony. But the Massachusetts Bay Colony, which attracted tens of thousands of settlers, did pose a threat. The Puritans, believing themselves to be God's "elect," had few qualms about dispossessing Native Americans.

In 1637, the Pequot War opened the Connecticut River Valley for settlement. In 1675 to 1676, a large coalition of Native Americans led by Massasoit's son Metacom (or "King Philip") punished the Puritans. An alliance of the Puritan colonies, New York, and the Mohawks ended the threat and essentially ended Native American resistance to English colonization in New England. One of the causes of the outbreak of King Philip's War was the increasing reliance of the area's native peoples on Christian cultural and religious guidance. White New Englanders had made some modest attempts to convert the Native Americans, mainly by moving them into "praying towns." But young Wampanoag men resented these missionary efforts and the expanding power of the Puritan settlements.

Violence marred Anglo-Native American relations throughout eastern North America, but it was not the only way in which the groups interacted. In South Carolina, for instance, traders established a profitable exchange that would continue for several decades. And in Pennsylvania, William Penn's Quaker beliefs brought to the area a period of cooperation known as the "Long Peace." Of course, in the eighteenth century, both of these colonies would engage Native Americans in brutal wars.

Spreading out from Charles Town in the 1670s and 1680s, Carolina's formidable network of traders provided the region's Native Americans with trade goods, which they could no longer get from the fragile and dilapidated Spanish mission system. A brisk trade in cloth, deerskins, firearms, and native slaves fanned out from Carolina to the Creek, Cherokee, Chickasaw, Catawba, and Yamasee. The trade was conducted on uneven terms, though, and soon many Native Americans, particularly the Creek and Yamasee, had fallen into debt. In 1715, Native Americans throughout the Southeast killed the English traders living in their villages and pushed back the effective line of English control.

As mentioned above, William Penn, a prominent Quaker who founded Pennsylvania in 1682, established peaceful relations with his native neighbors. Although there were many complex reasons this occurred, the two most important were the fact that the region's native population (which had been thinned by disease) feared Iroquois raids, and that Penn's Quaker beliefs prompted him to treat his native neighbors with respect, signing treaties and

paying them for land. As Pennsylvania expanded in the 1730s, Penn's heirs found it difficult to control settler violence, and the situation deteriorated through the middle of the eighteenth century.

Building Empires

The Spanish had met overwhelming numbers of Native Americans who refused to let them to settle. The French had established a small colonial presence in Canada, and the English had exploited native depopulation and rivalries to found colonies in the early colonial period.

By 1700, though, several large expansionist colonies and an increasingly tense rivalry between England and France would come to characterize native-white relations. And the rapid expansion of British North America in the eighteenth century—by the 1750s, the population of the thirteen colonies had reached 1.5 million—would alter native-white relations significantly.

Many Native American communities, such as the Tuscarora of North Carolina and the Delaware (Lenni Lenape) of Pennsylvania, were forced from their homelands entirely. Others, like Catawbas in South Carolina and numerous smaller groups in New England, resigned themselves to the domination of a nonnative majority and began to integrate themselves into colonial life.

During the eighteenth century, even powerful nations like the Creek and Cherokee in Georgia and South Carolina, respectively, were forced to evacuate and to cede or sell pieces of their homelands. Although they tried to maintain cultural autonomy as they lost political autonomy and military power and they, like other Native Americans, continued to play an important role in eastern North America, North America was, in fact, becoming increasingly English. The Seven Years' War, or the French and Indian War as it was known in the colonies, all but completed the shift.

In the 1750s, France and its native allies (mainly from the Midwest and the Great Lakes region) began to attack British settlements and outposts in the Ohio River Valley. These hostilities led to the establishment of Fort Duquesne, present-day Pittsburgh. Britain and France basically decided to force each other into a final showdown for North America, though the fight spread around the globe as well. The British fared poorly at first, but their fortunes reversed under the able leadership of William Pitt (the new prime minister). Sensing the turning tide, the Iroquois gave up neutrality and formed an alliance with the British. After the Treaty of Paris in 1763, France gave up its North American empire, leaving Britain as the sole colonial power.

Tribes that had been accustomed to playing the European powers off against one another no longer had that option, and the British knew that. Jeffery Amherst, the commander of British forces, also stopped distributing gifts to allied natives.

The 1760s saw two native revivals that cut across tribal lines. Followers of Pontiac and Neolin, or the "Delaware prophet," rejected European culture, and the rebellion that bears Pontiac's name removed the British from many of their western outposts. In 1763, the British reconciled with Native Americans and promised to protect them from encroaching settlers. The Proclamation of 1763 drew a line along the top of the Appalachian Mountains and declared everything west of the line Native American lands.

The 1763 proclamation did little to stop the Anglo-American movement westward, however; by 1768, Britain had ceded control of Native American affairs back to the colonies. To make matters worse, by the Treaty of Stanwix, the British and Iroquois ceded a wide swath of land belonging to the Shawnee, Delaware, and Cherokee.

In the American War for Independence, most native communities, though not all, sided with the British. In the wake of the stunning British defeat, the newly created United States government treated all Native Americans as defeated enemies and dealt with them harshly.

Native Americans

Any meaningful account of colonial America must recognize the crucial role of Native Americans in the struggle for the continent. Until the last half of the eighteenth century, the eastern portion of North America was above all else native land.

The First Americans

The origins of the first Americans are still hotly debated in some circles, but the most widely accepted theory is that Asia's population expanded into North America over the Bering Strait land bridge between 40,000 and 10,000 b.c.e. These Paleo-Indians relied on big game hunting, as well as gathering, and they probably lived more or less as equals in small bands that ranged over large areas. By 8000 b.c.e., however, many large game animals—including mastodons, mammoths, and camels—had become extinct. Archaeologists debate whether climatic changes or overhunting brought about their demise. The habitable portion of North America contained perhaps 100,000 people during this period; it seems unlikely that such a small, dispersed population could hunt several species to extinction. (Of course, European Americans brought the passenger pigeon to extinction rapidly by repeatedly killing off the youngest generation.)

By 8000 b.c.e., glacial ice was also no longer a factor for most of North America, and many of the landscape's present-day physical features and animals were in place. Paleo-Indians began to hunt smaller, less mobile creatures, such forest-dwelling deer or fish that repeatedly migrated to the same place. Paleo-Indian population and population density rose dramatically during this period (sometimes referred to as the Archaic period). People living in the Mississippi watershed also began to plant crops such as squash at roughly this time. Eventually, large, sophisticated societies grew from these humble beginnings.

The Mississippian culture, with major cities at Cahokia (near present-day East St. Louis), Spiro, and Natchez, dominated the eastern half of North America. By 1100 c.e., Cahokia was home to a complex, stratified society of 20,000 people. In the Southwest, by roughly 1250, a group called the Anasazi had planned and constructed twelve large towns and hundreds more informal villages, constituting a formidable trading empire.

From 1400 to 1600, these large, centralized societies declined and smaller, decentralized polities, often multiethnic and multilingual, replaced them. These are the forerunners of the Native American communities that met Europeans in the fifteenth and sixteenth centuries. Native American societies were strikingly diverse, speaking hundreds of mutually unintelligible languages, subscribing to widely varying belief systems, and inhabiting virtually every part of North America's plains, forests, deserts, mountains, and grasslands. They are often divided into broad language groups like Algonquian, Iroquoian, Muskogean, and Siouan; many modern tribal names date from the period of European colonization.

It is important to recognize that Native Americans were undergoing drastic cultural shifts in the period leading up to their "discovery" by Europeans. One of the most common mistakes in colonial history is to assume that native societies were static, simply waiting for Europeans to enter their land so that history could begin.

Discovering Europeans

Although contact with Europeans themselves became more common throughout the colonial period, most Native Americans discovered Europeans through trade goods and disease. Because they had remained isolated from European and African diseases, the native peoples had no immunity to them. Smallpox was a particularly lethal killer. The estimates of Native American population and depopulation vary widely, but even modest estimates suggest that the population north of the Rio Grande before 1492 was over 5 million. By 1900, only 250,000 Native Americans lived in this area.

North America Indian Tribes, 1492. *A wide diversity of native peoples lived in North America at the time of their first encounter with Europeans. The above map shows the major regions and tribes of North American Indians in 1492.* (Carto-Graphics)

While disease was *one* factor in this tragic decline, it was not the only factor. Dispossession, relocation, and centuries of colonial rule also drastically reduced the Native American population. In some areas, such as southern New England, more than 75 percent of the Native American population died within the first few decades of English settlement.

As noted above, Native Americans also discovered European trade goods, alcohol, and firearms. At first, native groups adapted European trade goods into their own ways of life. For instance, copper kettles were of great value not as cookware but as sources of copper, pieces of which were worn as a sign of prestige in some communities. As the colonial period progressed, Native Americans began to use European goods in European ways. They often became dependent on these goods and on trade with nearby European settlements, and were drawn into the expanding Atlantic economy.

Beginning in Paleo-Indian times, native peoples up and down the Atlantic coast of North America relied on fishing as a primary means of sustenance. This illustration depicts Virginian natives during the sixteenth century. (Brown Brothers, Sterling, Pennsylvania)

The French and Spanish made inroads into North America in the sixteenth century, and the English followed in the late sixteenth and early seventeenth centuries. These earliest contacts were little more than reconnaissance missions and had minimal impact on native cultures.

The major exceptions were the native people, usually young men, who were carried back to Europe as trophies or in the hope that they could learn European languages and become interpreters. In 1534, Jacques Cartier kidnapped two sons or nephews of the St. Lawrence Iroquoian chief Donnacona. The Spanish explorers Pedro Menéndez de Avilés and Lucas Vázquez de Ayllón both used native interpreters.

After their initial coastal contacts, European explorers, missionaries, and armies began to move farther inland. There, they met a wide range of native cultures. The Spanish in the Southeast, for instance, witnessed centralized Mississippian cultures before their decline. Hernando de Soto, who cut a path of destruction across the Southeast between 1539 and 1542, stayed at Cofitachequi, a chiefdom near present-day Camden, South Carolina. The French established close ties with the villages of Huronia, in Ontario. Both the French and Spanish claimed native converts, but the extent to which native peoples accepted Christianity is unclear and still debated.

The sixteenth century brought an increasing number of fur traders to French Canada. These men had little effect on native ways of life, though they did encourage Native Americans to hunt for beaver more extensively. They also fathered many biracial children, known as Métis.

One of the long-standing myths of this early period of contact is that Native Americans believed the European explorers had supernatural powers; most of the evidence to support this comes from the explorers' own records. If the natives did initially think this way about the Europeans (because they came from the sea and seemed immune to smallpox), close contact with them probably soon changed their minds.

The seventeenth century saw the planting of several colonies on North America's Eastern seaboard and an increase in the interaction between Native Americans and their new neighbors. Native Americans continued to understand themselves and the newcomers in terms deeply rooted in their American past.

An example of this is the way that Powhatan, a paramount chief in control of the eastern half of Virginia, dealt with the English who settled at Jamestown in 1607. Powhatan treated the English colony as another village in his realm. He demonstrated his power by kidnapping John Smith and adopting him into the world of the Powhatan. When the English overstepped their bounds or pressed the Powhatan for food, Powhatan reacted violently. Even after the settlement of Jamestown, Virginia was still Powhatan territory.

European involvement also had a serious impact on Huron-Iroquois relations. The Huron had allied with the French, accepting Jesuit missionaries in their settlements and becoming major power brokers as a result of their involvement in the fur trade (their access to furs from the Great Lakes region ensured their position). The Iroquois, armed by the Dutch, turned European colonization to their advantage by taking furs from Huron traders and captives to the

Dutch at Fort Orange (present-day Albany, New York). The Iroquois (an alliance between the Cayuga, Onondaga, Seneca, Mohawk, and Oneida) increased their power as a result of colonization. By 1649, the Iroquois had destroyed the Huron as a political entity. Some were adopted into Iroquois villages, and others scattered to the Great Lakes. The Iroquois also began to distribute wampum (southern New England shell beads) to neighboring tribes in an effort to cement alliances.

Most Native American communities with close Euro-American contacts did not fare so well in the seventeenth century. The Pequot, for example, were a relatively powerful tribe that controlled the Connecticut River Valley. The Puritans at Massachusetts Bay and Plymouth, looking for new farmland and noticing a decline in the Pequot population, launched a genocidal war against them in 1637. The main action of the Pequot War took place at a fort on the Mystic River: the Puritans set fire to the fort and put between 500 and 1,000 Pequots (mainly noncombatants) to the sword as they fled the flames. The peace treaty that ended the war forced the Pequot to renounce their identity.

It bears mentioning that Native Americans fought on both sides of the two major conflicts over New England, the Pequot War and the much more devastating King Philip's War (1675–1676).

Living with Europeans

By the eighteenth century, it had become clear to many Native American communities, particularly those east of the Mississippi and in New Mexico, that Europeans were to be a permanent physical presence on the landscape, for better or worse. Native Americans adapted to this fact in a variety of ways, and they found it increasingly difficult to hold onto their cultural identity, land, and political autonomy as the colonial period progressed.

Three trends are crucial to understanding the eighteenth-century plight of Native Americans east of the Mississippi. English and French imperial power was expanding rapidly, English settlements were experiencing a population boom all along the Eastern seaboard, and only the most powerful Native American groups, or those best positioned to play the European powers against one another, would survive the period with any semblance of autonomy.

The case of the Tuscarora, an Iroquoian-speaking, sedentary farming tribe who lived in North Carolina, demonstrates the problems faced by Native American during this time. They had become dependent on the goods offered by English traders operating out of both Carolinas, and, in the first decade of the 1700s, they were further squeezed by the founding of English and Swiss/German colonies on the Neuse and Cape Fear Rivers. They struck back violently, killing 130 settlers in a single, swift attack in 1711. The military forces of North Carolina did not offer much resistance, but the combined forces of the colony of South Carolina, its Yamasee allies, and the Cherokee defeated the Tuscarora. By 1722, most of the Tuscarora had retreated to New York, where they joined the Iroquois and became the Sixth Nation.

The Creek in the Southeast and the Iroquois in the Northeast both survived the colonial onslaught. Although both had become dependent on European goods, each of these native powers was in an ideal position to play the Europeans off one another to its own advantage. The Creek and Iroquois were also willing and able to absorb the refugee populations of defeated tribes.

The Seven Years' War, known in America as the French and Indian War, would all but destroy Native American diplomatic options. The conflict erupted in 1754, during a prolonged period of explosive European (particularly English) population growth. The population of the thirteen colonies grew from 250,000 in 1700 to 1.6 million in 1760, placing extraordinary new pressure on Native America.

In the early 1750s, seeking to regain lost trade, the French and their native allies began to attack British frontier posts. By 1754, they had beaten the British out of the Ohio River Valley and established Fort Duquesne (present-day Pittsburgh, Pennsylvania).

By the middle of the eighteenth century, both England and France had recognized the importance of controlling North America, so they decided it was time for a final showdown for the entire continent (or at least its eastern half). Both nations poured men and resources into the conflict. The early years of the war saw decisive French victories. The British were forced to give up their western posts, and Native Americans allied with the French destroyed settlements in the western parts of Virginia and Pennsylvania (at the low point of the war, the fighting came within 30 miles of Philadelphia). The Iroquois managed to remain neutral in the early years of the war, although the Seneca did aid the French in some of their campaigns.

The year 1758 was pivotal. The British, through the masterful diplomacy of Sir William Johnson and the renewed interest in the war shown by the new prime minister William Pitt, were able to convince the Iroquois to join their side. They pushed the French out of the Ohio Valley and eventually went on to the heart of French Canada, taking Montreal and Quebec. The Treaty of Paris, signed in 1763, effectively removed the French from North America. By the terms of the Proclamation of 1763, the British drew a line (along the top of the Appalachians) that would separate North America into Native and Anglo-American spheres.

The Proclamation of 1763 was a miserable failure, and not just because Native Americans and Anglo-Americans already lived on both sides of the line. It infuriated American colonists, who wanted to retaliate against Native Americans and secure lands on which they had been speculating for a number of years. To make matters worse, Native Americans could no longer use European conflict to their advantage.

If the French and Indian War was bad for Native Americans, the American Revolution was a total disaster. Some Native Americans fought on both sides, though most groups—fearing American expansionism—sided with the British.

After the war, it mattered little what side specific Native American communities had fought on. Native Americans were considered hostile foreigners in their own land, and they suffered mightily at the hands of the young American republic. Although many tribes survived the eighteenth century, they faced an uncertain, and likely gloomy, future. Native Americans would reinvent themselves repeatedly in the years following American independence; they would rely on a variety of strategies to cope with the harsh political realities they faced.

Some trends of Native American life in the colonial period deserve mention here. The population of native North America declined catastrophically as a result of exposure to European diseases and colonial dislocation. Still, Native American communities survived two centuries of intense colonial pressure by adapting to their rapidly changing political environment. Equally remarkable is the fact that some Native Americans survived with their tribal identities intact, albeit in altered forms.

Native Americans and Slavery

The relationship between Native Americans and slavery is complicated. Native Americans held war captives (though mainly for social purposes, not as laborers), Native Americans were enslaved by Europeans, and Native Americans enslaved Africans. The second two practices had more in common with the way people generally conceive of slavery.

Native Americans' enslaving of Africans occurred mainly in the South, particularly among interior agricultural nations such as the Creek and Cherokee, although it did not become widespread until after the War for Independence. Except in certain areas on the Northwest Coast, however, Native Americans did not place monetary value on slaves or exchange them as property.

The European practice of enslaving Native Americans was integral to the way both the Spanish and English approached colonization. The French also practiced native slavery on a small scale but gave it up around the turn of the eighteenth century. After the first few decades of settlement, the Spanish began to use different methods to force the labor of Native Americans, while the English relied more on indentured servants from Europe and slaves from West and West Central Africa.

The arrival of the Spanish at Española (Hispaniola) in 1492 not only signaled the end of the isolation between the Americas and the Europe but also began the European practice of enslaving Native Americans. Columbus and his men enslaved the Taino they met, as well as other native Caribbean peoples.

Mainland Native Americans came face to face with this threat as Spanish sea captains raided coastal tribes for slaves. The journeys of Ponce de León in Florida in 1513 and Hernando de Soto throughout the entire Southeast in 1539 to 1542 were not only treasure-seeking missions and military expeditions. Both men enslaved Native Americans as they passed through.

Some forces within the Spanish Empire worried about the effects that slavery might have on indigenous people in the Americas. The most vocal critic of enslaving natives was Bartolomé de las Casas, a priest who had witnessed the destruction wrought by Columbus's men in the Caribbean. In 1542, las Casas wrote his *Short Account of the Destruction of the Indies*, a forceful denouncement of the practice of enslaving native people. Spaniards eventually abandoned the outright enslavement of native peoples in favor of the more subtle coercion of the *encomienda*, a tribute system that basically required Native Americans to labor for individual landholders or the Catholic Church. The largest of these was granted to Hernando Cortéz, who controlled the labor of 23,000 families in Oaxaca. To the native peoples laboring in the fields or mines of prominent Spaniards or on mission churches, the differences between slavery and *encomienda* must have seemed slight.

Slavery Under the English

Although slavery had not been practiced in England for hundreds of years, and in spite of the fact that official English policy frowned on the enslavement

of Native Americans (after all, it was part of the “Black Legend” of Spanish colonialism, which said the Catholic Spanish were particularly cruel in the Americas), English colonists all along the Atlantic coast captured, sold, and used Native American slaves from the earliest years of settlement. English colonial America suffered from a chronic labor shortage and a widespread hatred of the native peoples, and these conditions allowed for a flourishing slave trade between English colonies and a system of native slave labor within them.

In 1622, Powhatans under the leadership of Opechancanough attacked the outlying settlements of Jamestown in what colonists and more than a few historians have referred to as the “Massacre of 1622.” The aftermath of the attacks more closely resembled a massacre, however, as angry colonists lashed out against the Powhatan. A tract published in London, titled in part *The Barbarous Massacre in Time of Peace and League, treacherously executed by the native infidels*, argued that some good could come of the violence: “the Indians, who before were used as friends, may now most justly be compelled to servitude in mines, and the like, of whom some may be sent for the use of the Summer [Caribbean] Islands.”

After conflicts with Native Americans in 1622, 1644, and 1676, Virginians took native people as slaves. Although most of these slaves appear to have been exported to the West Indies to support the growing sugar industry, some stayed in Virginia to labor on tobacco plantations.

In New England, the situation was strikingly similar. Following the Pequot War of 1637–1638 and King Philip's War in 1675–1676, New Englanders sold large numbers of defeated Native Americans into slavery in the Carolinas and the West Indies. A small number even made their way to England. The kidnapping of individual Native Americans also occurred, though this method of enslavement is harder to trace.

A survey of the English colonies in the seventeenth century would have found Native American slaves in every one. The Middle colonies had the lowest numbers of native slaves, while New England and the South had the highest. By the turn of the eighteenth century, South Carolina's population of native slaves would dwarf that of all the other mainland colonies.

Carolina and the Native Slave Trade

It would be an understatement to say that the arrival of the English and the subsequent establishment of the slave trade disrupted Native American life in the Southeast. From its modest beginnings at Charles Town in 1670, the English slave trade grew to a wildly profitable, competitive industry that exploited the region's Native Americans to an extreme degree.

One of the consequences of contact with Europeans was the increasing demand by the native peoples for access to English trade goods, particularly firearms, manufactured cloth, and rum. In return, the English demanded deerskins and slaves. The terms of exchange were rarely, if ever, equal, and Native Americans often soon fell into debt to Carolina traders, forcing them to extend hunting seasons and expand hunting territories.

Native Americans also found that they could profit by selling war captives to the English; they could profit even more by raiding enemy groups for slaves. Tribes allied with the English, or at least armed with English rifles, forayed far to the west in search of slaves. One scholar estimates that the Choctaw lost over 2,000 people to slave raiders armed by Carolina traders. Although English colonial policy outlawed enslavement of the native peoples, this edict was unenforceable.

The Yamasee, who by the 1680s had moved into the sphere of the English at Charles Town, were famous for wreaking havoc on neighboring communities of independent Native Americans or those allied with the Spanish. Thomas Nairne, the chief Indian trader operating out of Carolina, undertook a slave-raiding expedition with the Yamasee that captured 30 or so slaves. The account left behind by Nairne indicates that, by the early years of the eighteenth century, slave raiding had become a reasonably precise science. The Yamasee knew exactly where unsuspecting natives could be found and were able to capture large numbers of them at once with a relatively low risk of casualties. During the Tuscarora War (1711–1715), native South Carolinians fighting in the army of John Barnwell captured Tuscarora slaves at a rate that upset the white command, not because they disapproved of the practice, but because they wanted slaves for themselves.

Besides being exported from Charles Town, Native Americans were forced to labor alongside indentured servants and growing numbers of Africans in the rice plantations of South Carolina. During the late seventeenth and early eighteenth centuries, up to 25 percent of plantation labor may have been provided by Native American slaves. Working and living alongside African American slaves, these Native Americans exerted a profound influence on the development of African American culture.

Native American slavery declined throughout the eighteenth century in English America, largely because of the massive importation of African slaves. Although some Native Americans, particularly Southern groups like the Cherokee and Creek, would eventually adopt white racial attitudes toward African Americans and acquire their own plantations, this development, by and large, occurred in the 1780s, after the American War for Independence.

Navajo

The Navajo's origin story tells of their eternal presence in the region where the Holy People ordered the universe and charged them with maintaining that order. Archaeologists, however, postulate that the Navajo, or Dine people, as they call themselves, migrated from the northwestern parts of the continent to their current home in the Southwest.

The Navajo remain tied to the native peoples to the north through their Athapaskan language. One of only two groups in the Southwest of Athapaskan origin, the Navajo reached the region sometime between 900 and 1500 c.e. Their migration was long and gradual, following the front range of the Rocky Mountains southward into northern New Mexico. Their arrival prompted a general reshuffling of the native peoples in the region. The territory they chose as their homeland (Dine'tah) was a vast, sprawling region marked off by their four sacred mountains: the San Francisco Peaks to the west, Mount Taylor to the south, Blanca Peak to the north, and Hesperus Peak to the south. Essentially a hunting people, the Navajo learned from their Pueblo neighbors and fully adapted to their new environment in the centuries before Spanish contact. Adaptability was central to the Navajo character, for the great strength of the Navajo has been their ability to learn from others and incorporate new methods into their culture.

In the 1540s, an expedition led by Francisco Coronado lumbered through the region. This expedition gave the Spaniards their first contact with the *Apaches de Nabajo*. The Spaniards referred to all Athapaskan-speaking peoples as Apache and then located them geographically. The first contact between Navajos and Spaniards occurred at the base of Mount Taylor and was initially friendly, but fighting soon erupted as a result of the Spaniards' desire to retain some Navajo captives obtained from the Hopi.

With Spanish settlement came new pressures on the Navajo people. The Navajo adopted little Spanish culture, evidenced by the lack of Navajo names in baptismal records and the lack of Spanish words in their vocabulary. Spanish livestock, however, was another story. Because of their sedentary lifestyle and large territorial holdings, the Navajo readily accepted the new animals into their culture, completely remaking their economy. In true Navajo fashion, the people created new traditions that told of how the Holy People had given them the livestock, thus negating the Spanish influence. In this way, relations between the Navajo and the Spanish remained cordial until 1680.

In 1680, a native revolt, designed to overthrow the Spanish, erupted in the region. The Navajo were ready participants, as throughout the seventeenth century the Spanish had been unable to control their growth and cultural independence. When the Spanish regained control over the region in 1692, the Navajo were flooded with refugees from the Pueblo tribes. The arrival of the Pueblo in Navajo territory brought together the two roots of historic Navajo culture, the Athapaskan-Apachean and the Anasazi-Puebloan. Navajo culture was again transformed. Spanish stock-raising supplanted agriculture, and pottery and weaving techniques became more advanced as a result of the Pueblo influence.

Intermittent warfare with the Spaniards marked Navajo society until sometime around 1716, after which a gradual peace was forged, as both Spaniards and Navajos found a new enemy in the Ute. Once peace with Spain was secured, the Navajo faced new pressures that tested their culture's flexibility. In the face of severe drought and increasing attacks from the Ute, the Navajo abandoned their Puebloan traits and began to raise livestock in widely dispersed communities.

In expanding their territory, Navajos came into contact with Spanish settlement in the region. As a result, in 1774, war with the Spanish resumed, when the Navajo drove Spanish settlers from eastern portions of their territory. Their success in war with the Spanish demonstrates the strength of the new Navajo way of life that developed during this period. Now secure, the Navajo continued to expand their territories, moving into areas left vacant by the Spanish.

Held together socially by a vast ceremonial system designed to restore the universe to harmony, the Navajo absorbed, traded with, and raided other peoples, always learning from various groups in the region. Despite their adaptability, the Navajo had little knowledge of the onslaught that lay ahead. Despite the massive toll taken by disease, Spanish imperial policy, missionary work, and other crises caused by contact, the Navajo continued to believe that they could retain the order the Holy People had given to the universe.

Navigation Acts (1651–1733)

Although England established its first shipping regulations in the fourteenth century, trade between England and the American colonies was still duty-free as late as 1642. Under mercantilist, or pre-free market capitalist, theory, trade with the colonies was encouraged, while trade with rival nations was to be limited as much as possible.

The first navigation act came as an attempt by Oliver Cromwell, under the British Commonwealth, to counter the Dutch carrying trade (transporting goods of another country), which was more efficient than and threatened to overwhelm British shipping interests. The Navigation Act of 1651 required all imports from Asia, Africa, and America to be brought in English-owned vessels. European goods could travel on ships of the producing country, the receiving country, or, again, on ships belonging to English people. Colonial goods also had to enter England on English ships or on those of the originating country.

This act damaged New England's interests, because Northern colonial products were similar to those produced in England. As suppliers of raw material and receivers of finished goods, the Southern colonies benefited from the limitation on trade in Southern products, such as tobacco, ship's stores, and rice. Northerners adjusted because the act was ignored or only loosely enforced. The real intent of the act was to hurt the Dutch—colonial feelings did not matter—and it did lead to the first Anglo-Dutch war.

The next act, in 1660, required colonial trade on English vessels only; defining colonial ships as English, the act helped develop Northern shipping. This act hurt the Southern colonies by enumerating the items the colonies could and could not trade outside English territory. Restricted items included wool, sugar, tobacco, and cotton. Over time, modifications to the Navigation Acts expanded the list of enumerated items. Even worse, this act imposed a duty on exports to England. The act of 1672 extended this tax to intercolonial trade in restricted items. The impact of these taxes on trade among the colonies and with Europe or the West Indies could have been disastrous, but again enforcement was mostly nonexistent.

Other acts came into being in 1661, 1662, 1663, 1670, and 1673. The act of 1663 required all shipments to the colonies to pass through England. On the other hand, colonial commodities did gain preferential treatment—monopolies or tax exemptions. Tobacco was an American monopoly, while the West Indies had tariff protection against the French sugar interests. State subsidies were also English policy, designed to guarantee a steady supply of critical items such as ship's stores.

The most unpopular act was the Molasses Act of 1733. It increased tariffs on sugar and molasses from the French West Indies. Trade for these items was the New England way of getting rid of its surplus flour, lumber, livestock, and fish; the English Corn Laws barred these items from England, and there was no other market. The risk of economic disaster was real but enforcement was lax. Still the acts galled. And the protected British West Indian sugar was too expensive. The New Englanders kept their French West Indian trade by smuggling. The British began enforcing their restrictions after the French and Indian War, thirty years after New Englanders had begun smuggling in response to the Molasses Act. Seemingly arbitrary seizures of vessels increased the hostility of the colonials. The Navigation Acts limped along until they finally were repealed in 1849, and the mercantilist policy was replaced by free trade.

The English oversight and enforcement efforts proved ineffective, making the situation worse. In England, the Board of Trade and Plantations, charged with enforcing the act, came into being only in 1696 and proved somewhat more effective. Still, enforcement was nearly impossible when oversight was weak. Lawbreakers connived with the local customs officials and possibly the governor, and admiralty court juries refused to convict their neighbors, maybe fellow smugglers. Smuggling was a popular pastime in Britain, with an estimated 40,000 or so smugglers of Indian tea and French silk.

The British adoption of the mercantilist philosophy meant that inevitably conflict would arise. The colonies became more substantial and independent, less willing to accept trade deficits and restrictions on their livelihoods, and reluctant to make sacrifices for the good of the mother country with no reciprocal benefit. Britain's difficulties were only made worse by her bad habit of forgetting the colonies in favor of more immediate business, such as the British Civil War, the Glorious Revolution, and wars with the Dutch and French. Benign neglect became merely neglect, and when the British tried to re-establish a strong subordinate status after the French wars, it was too late. People accustomed to ignoring or working around the multiple Navigation Acts had no compunction about resisting new laws, which were inconsistently applied and frequently repealed under colonial pressure.

Navy, British

During the colonial period, Britain's navy was transformed from a small and provisionally organized and financed entity into the largest, most complex, and most powerful maritime force in the world. Although the navy did not officially adopt a policy for North America until the middle of the eighteenth century, it proved effective through most of the period in both defending Britain's Atlantic trading empire and laying siege to the holdings of other European nations. Its resources were strained by the American Revolution, to the extent that Britain temporarily lost command of the sea, though the British Navy reclaimed oceanic supremacy by century's end.

Seventeenth Century

Prior to the mid-seventeenth century, England did not possess a navy that was operable during both war and peacetime. Although several specialized warships were built during and after the reign of Henry VIII, financial constraints and major competition from well-established naval powers slowed the growth of the English navy except in times of war or threatened invasion, as in the case of the encroaching Spanish Armada in 1588.

At the end of the English Civil War, Parliament passed the Navigation Acts and devoted considerable resources to establishing a large standing navy for the protection and enlargement of the nation's maritime trade. Aimed primarily at the Dutch, the premier naval power in Europe, these measures led to three wars between the two countries in the seventeenth century. England fared well in the first (1652–1654), and although the navy enjoyed only a few successes in the second (1665–1667) and the third (1672–1674), the conflicts served to reduce the Dutch to a secondary naval power. Apart from sending a force to capture New Netherland (renamed New York) in 1664, the navy fought its campaigns mainly in domestic waters.

Following the Dutch wars, France became England's principal maritime rival. English naval dockyards and the victualing (provisioning) of ships were substantially improved, allowing the navy to cruise in distant waters. A struggle in parliament soon ensued over the projected role of the navy. The Whig government believed it was unnecessary for the navy to have a formal presence in North America, as England's colonies experienced only sporadic threats. The navy's chief concern there was the protection and administration of the Newfoundland fisheries. The navy's main squadrons were stationed in the Mediterranean, on the French Atlantic coast, and in the English Channel to support land-based campaigns on the Continent, blockade French ports, and defend England from possible invasion. The ascendancy of the British navy was sealed in 1692, with its destruction of the core French fleet in the Battle of Barfleur in 1692. At century's end, the British navy consisted of 170 ships, compared to just 40 in 1600.

Eighteenth Century

Under a Tory government, the navy began to operate farther afield, though its activities in North America remained intermittent. British naval forces eventually took the French base at Port Royal, Nova Scotia, renamed it Annapolis Royal, and strengthened its fortifications. A failed amphibious assault on Quebec in 1711 by a large force led by Admiral Hovenden Walker marked the end of the short-lived attempt to extend the navy's reach to North American waters. The colonies lacked adequate facilities to sustain the navy for extended campaigns, and the potential gains did not yet outweigh the costs. This changed by midcentury, as the value of colonial trade to Britain increased and required protection and the navy became more reliant on North America as a source of seamen and products such as timber, pitch, and tar.

The impetus for the British navy's heightened presence in North American waters was the renewed threat of the French after 1744. Although France was active in fortifying Louisbourg and Quebec and rebuilding its naval fleet earlier in the century, Britain did not establish a corresponding naval base in the northern region of the continent. Instead, Britain focused its energies on protecting its Southern colonies of South Carolina and Georgia from possible Spanish attack. The navy was also active in the West Indies, as a squadron under Admiral Vernon captured the Spanish port of Porto Bello during the War of Jenkins' Ear (1739–1743), followed by a failed siege of Cartagena.

In 1745, Britain responded to the French threat in the northern part of America by commissioning Captain Peter Warren the commander in chief of a North American squadron. French forces advanced on Canso, Nova Scotia, that year, but they were held at Annapolis Royal, Nova Scotia, by troops and naval vessels from New England. Warren's fleet united with the New England force and laid siege to Louisbourg, which fell after seven weeks. When Louisbourg was returned to France in 1749, Britain recognized the strategic importance of having a North Atlantic naval base to counter future French hostility in the region and chose Chebucto (renamed Halifax) for its location.

North America became the chief arena for British and French conflict during the French and Indian War (known as the Seven Years' War in Europe). Large squadrons of the British Navy were sent there, and the fleet achieved several major victories with the valuable assistance of a strong colonial force of privateers. In 1755, the navy assisted an expedition from Massachusetts against French forces at Chignecto, which drove the French from the Bay of Fundy. While the navy convoyed a force under the command of Braddock to attack the French on the Ohio, it also moved a squadron into the Gulf of St. Lawrence under Admiral Boscawen to prevent French reinforcements from arriving in Quebec. The latter action failed, however, as the force did not arrive in time. Further missed opportunities resulted in the building of a royal dockyard at Halifax in 1758. The British immediately reaped the rewards, for part of the North American squadron wintered in Halifax and arrived off Louisbourg three months earlier than in the previous year to effectively blockade the fortified town and attain victory.

The British Navy—the world's most powerful maritime force—suffered its worst defeat of the American Revolution in September 1779, when the colonial Bonhomme Richard, commanded by John Paul Jones, forced the surrender of the HMS Serapis off the English coast. (Guardian Royal Exchange Insurance Collection/Bridgeman Art Library)

The British navy pursued the same strategy against Quebec the following year, as its vessels arrived in the Gulf of St. Lawrence before the French and deprived the city of much needed supplies and reinforcements. The navy bombarded the city during the months prior to Wolfe's victory on the Plains of Abraham, forcing much of the population to flee outside the walls and destroying most of the city's infrastructure. The British conquest of New France was ultimately achieved by Admiral Hawke's devastation of the heart of the French fleet at Quiberon Bay later that year and the arrival of a British squadron at Quebec in the spring of 1760 with supplies for its forces. British naval victories in Guadeloupe (1758), Martinique (1761), and Havana (1762) also hastened the end of the war and the French regime in North America.

Between 1763 and 1775, the British navy became more active in North America. This was made possible by the existence of a colonial support system that provided crews, provisions, and a host of ancillary services. The navy supported large numbers of troops now stationed in the colonies and conducted coastal surveys of the continent's northeastern coast. The navy was also directed to enforce a series of parliamentary acts designed to reduce smuggling and tax colonial trade through the imposition of new customs duties. Naval seizures of colonial trading vessels created friction between colonial merchants and Crown officials and generally helped foment anti-British sentiment. Customs commissioners and other Crown representatives sought refuge aboard navy vessels during the Stamp Act crisis in 1765. Colonial animosity against the navy was made still worse by its part in enforcing the Townshend Acts in 1768. Greater use of the press also increased the colonists' resentment of the navy and sparked riots in several ports. The navy became a direct symbol of British tyranny in America, especially after it closed the port of Boston in 1773 and attempted to enforce the Intolerable Acts.

Britain's navy proved unprepared for war in the summer of 1775 and was quickly overwhelmed, as naval vessels became the refuge for governors and other royal officials while attempting a blockade of the entire Atlantic coastline with only thirty warships. During the American Revolution, the British navy proved most effective in the raid and capture of key ports such as New York and Newport in 1776, Savannah in 1778, and Charles Town in 1780. It could not, however, manage a successful blockade of the Chesapeake or New England and thus did not heavily impact the war on land. This was due in part to a large and well-developed colonial merchant marine that was quickly converted into an aggressive and resolute privateering fleet. As Continental privateers expanded their operations overseas to attack British merchant shipping and supply lines, the British navy was forced to allocate resources closer to home and assemble costly and time-consuming convoys.

The British navy faced a different war once France entered the conflict in 1778, followed by Spain (1779) and Holland (1780). Its role changed from supporting a war of occupation and conquest to fighting a major European maritime war. The navy lost its numerical superiority by 1780 and was forced to keep most of its battleships in domestic waters and the Mediterranean. The failure of Admiral Graves's squadron to control the Chesapeake in September of 1781 led to French occupation of the bay and General Cornwallis's surrender to the Continental army at Yorktown weeks later.

Britain soon recovered her naval strength. Although this came too late to save the American colonies, it did enable Britain to retain those farther north and in the West Indies, the Mediterranean, and the British Isles. Britain again became the world's leading naval power, which allowed the nation to resume its imperial ambitions and commercial expansion all over the world well into the nineteenth century.

Negro Election Day

Negro Election Day was a festival in the Dutch colony of New Amsterdam whereby the African American community chose its unofficial leaders.

Most early colonial settlement was located along lucrative seaports or large river valleys. This commonsense approach to establishing villages not only promoted much needed trade connections, but it also provided entranceways for European immigrants wanting to move to the New World. After the New England colonies had firmly planted roots, the move to settle began in what were known as the Middle colonies—New York, New Jersey, and Pennsylvania—and the most unique of these was New York.

New York only became an English colony in 1664, long after the Dutch had settled New Amsterdam (New York City) and New Netherland (New York). It began in 1609, when the Dutch East India Company, on a classic exploration search, sent Henry Hudson to the New World to find a Northwest Passage to the Orient. Sailing along the Atlantic coast, he took a side trip up a large river, but found it dwindled down to a stream. While Hudson failed to discover a route to the Orient, the river that now bears his name became a productive fur trading post, which the Dutch needed to show a profit from their exploration.

Even though this was the first non-English colony to be established in early America, it was New Netherland's fundamental diversity that made it different from its neighboring English colonies. Although relatively few in number, its early settlers embraced immigrants from Holland, Sweden, France, and Germany and also—most importantly—from Africa. When the Dutch West India Company attempted to mimic the success of the earlier East India Company, it began not only importation but also the transportation of a new commodity—blacks from Africa, who transplanted their unique customs and culture to New Netherland. Some of these people eventually won their freedom. This introduced a different type of hierarchy not seen in the other colonies. As New Amsterdam's population increased, its culture became more diverse, allowing foreign traditions and customs to become an important part of the city's daily life.

The lowest rung of a seaport's social hierarchy contained free and bound workers. Free laborers were mainly young white men and women—journeymen artisans, sailors, fishermen, domestic workers, seamstresses, and prostitutes. While the ranks of unfree workers included mostly apprentices and indentured servants doing menial labor in shops and on the docks, black men and women also made up a substantial part of the bound labor force. Although the vast majority of African slaves who were imported by the Dutch West India Company in New Netherland were sold to Southern plantations, some were bought by urban merchants and craftsmen. Laboring as porters at the docks, assistants in craft shops, or servants in wealthy households, colonial black residents made up almost 20 percent of New York City's population. As the percentage of black residents of New York, as well as the 10 percent in the other Middle colonies increased, limitations on blacks were put into place, as white society feared the African traditions and did not understand the importance of maintaining them.

The character of slavery in Northern seaports changed decisively during the mid-eighteenth century. At that time, warfare in Europe required the service of many who might otherwise have become immigrants, thus limiting the supply of white indentured servants. The colonial cities therefore imported larger numbers of Africans. These newcomers brought to urban black culture not only a labor force but also a new awareness of a common West African past. This culture made an impact as African traditions were tolerated and appeared most vividly in annual festivals, likened to those held in West Africa.

Initially, these festivals occurred only in New Amsterdam. Black men and women paraded in their masters' clothes or mounted on their horses. A special, albeit unofficial, election followed, during which the participants chose their own black kings, governors, and judges, who then conducted a special court session to settle minor disputes among white and black members of the community.

"Negro Election Day," with its temporary reversal of roles, was not intended to challenge the established racial order. This toleration and recognition of a different culture gave the black community of New Amsterdam a sense of importance, even if for only one day. This festival eventually spread to other colonial seaports, but it never became as important as it was in Dutch New Amsterdam and, later, English New York City.

New Amsterdam

Sharply contrasting the bustling metropolis that later emerged on Manhattan Island, New Amsterdam was a small, neglected outpost in the sprawling Dutch empire. From the 1620s through 1664, New Amsterdam served as the main town and trading post for the scattered Dutch settlements in New Netherland.

The Dutch West India Company, which governed the colony of New Netherland, settled the town with artisans, soldiers, sailors, merchants, and traders from throughout Northern Europe, and slaves from West Africa, the Caribbean, and South America. Diversity became the defining characteristic of New Amsterdam. Though the inhabitants were diverse, they also were few. Only 1,500 settlers lived in New Amsterdam and its immediate hinterland in 1664, when a largely uncontested English conquest established the new town and colony of New York.

After the Dutch secured independence from Spain in 1609, they quickly established colonies and trading outposts in Asia, Africa, Brazil, and the Caribbean. They also extended their burgeoning commercial empire to the Hudson, Connecticut, and Delaware River Valleys of North America. Dutch traders, hoping to tap into the fur trade with the Iroquois and other tribes, established Fort Orange at present-day Albany in the 1610s. In 1625 the Dutch West India Company established New Amsterdam at the tip of Manhattan Island to protect the valuable trade upriver, to produce food for Dutch colonies in the Caribbean, and to provide naval stores and a provisioning station for the Dutch fleet.

New Amsterdam, the name of New York City during the Dutch colonial period, is viewed at the lower end of Manhattan Island in 1653, the year in which its first municipal government was created. (Brown Brothers, Sterling, Pennsylvania)

Sometime in the spring of 1626, a company official “purchased” Manhattan Island. As the Native Americans understood matters, they had sold nothing to the Dutch West India Company, and they probably understood the transaction as a rental or lease agreement. The Dutch overlooked the technicalities lost in the cultural translation; confident that they “owned” Manhattan, they went about establishing the semblance of a town. By the fall of 1626, the settlers had erected thirty log homes, a fort, a secure countinghouse for trade, and a mill that also doubled as a church. Within two years, perhaps 250 settlers lived at New Amsterdam.

The town's population grew slowly over the next two decades. Prosperity at home meant that few Dutch men and women had any reason to emigrate to North America, and periodic and often deadly Native American wars deterred settlement. After a few years of trading, those few who did go to New Amsterdam usually returned home with their profits. Dutch imperial officials turned to the displaced groups, who had moved to the Netherlands over the past half-century to escape wars or religious persecution. Families of Flemings, Walloons, Scandinavians, Jews, Germans, and French Protestants all answered the Dutch West India Company's call for colonists in New Amsterdam, but again, only in limited numbers.

Already well-experienced in the slave trade, the Dutch West India Company and individual settlers turned to slave labor to address the town's chronic shortage of laborers, especially agricultural workers. Many of the slaves carried to New Amsterdam had been exposed to European languages and cultures in West Africa and the Caribbean. This background enabled them to integrate themselves into New Amsterdam's Dutch culture, while their concentration in the town and its hinterland allowed them to forge a distinct African-Dutch culture. Many became fluent Dutch speakers, married and baptized their children in Dutch churches, and took Dutch names, all the while retaining African cultural practices. Slaves could gain “half-freedom,” which

allowed them to work for wages and own property, in exchange for annual payments to the Dutch West India Company. By 1664, men and women of African descent accounted for one-fifth of the town's population, and perhaps a fifth had purchased their own freedom.

During its brief history, New Amsterdam served as the main town and trading post for the Dutch settlements and plantations along the banks of the Hudson River, Dutch traders upriver at present-day Albany, and Puritans and other English settlers on Dutch-controlled Long Island. Despite its prime location and the advantages of slave labor, New Amsterdam never became a bustling commercial center like Boston or Philadelphia. The overstretched Dutch West India Company concentrated its resources on potentially more lucrative adventures—raiding Spanish gold ships, competing with Portuguese sugar colonies, and capturing trading forts on the African coast—resulting in the neglect of New Netherland. Yet the failure of New Netherland ultimately stemmed from the unwillingness of ordinary Dutch men and women to settle in the colony.

The small population of New Amsterdam and New Netherland left it vulnerable to English imperial ambitions. When four English warships arrived in the harbor in August of 1664, the people of the town surrendered rather than see the town destroyed. In 1667, the Dutch formally ceded New Netherland to the English. Like its predecessor, colonial New York was characterized by diversity, and the Dutch continued to play an important role in colonial affairs. The two countries, however, continued to battle over the city until the English seized it in 1674.

New Bern

In 1710, Baron Christophe von Graffenried led a group of Swiss and German Palatine settlers to the confluence of the Trent and Neuse Rivers at the lower edge of North Carolina's Outer Banks. There, they founded the town of New Bern (named after the Swiss capital) on land von Graffenried supposedly purchased from the Tuscarora Indians.

The early settlers suffered from debilitating diseases, a warm, humid climate, lack of adequate supplies, and constant conflicts with the local natives, especially the Tuscarora. The Tuscarora complained about the colonists' encroachment on their homelands but received no redress of grievances. In frustration, they attacked the settlers, triggering the Tuscarora War in the Carolinas from 1711 to 1715. The North Carolina militia burned several native villages and traded sieges with the Native Americans before the Tuscarora finally made peace and moved to New York to join the Iroquois confederation.

New Bern, the second oldest town in North Carolina, enjoyed a quiet existence as a modestly successful port town through the early and mid-eighteenth century. It exported a variety of crops, but its main exports were lumber and naval stores. Tar, pitch, turpentine, resin, and shingles all left the swamps and long-leaf pine forests surrounding the town and made their way to England in the holds of merchant ships.

The port town enjoyed a surge in prestige and prosperity when, in 1770, Royal Governor William Tryon chose New Bern as the site of the colony's first permanent capital. He commissioned Tryon Palace, designed by English architect John Hawks, as the governor's residence and capitol building. After becoming the capital, New Bern developed the nickname "the Athens of North Carolina" for its cultural institutions. The colonial capital became the home of the first printing press, the first newspaper, and the first incorporated school in the colony.

In the days leading up to the American Revolution, New Bern played a significant role. The Sons of Liberty, led by Cornelius Harnett, held meetings here that defied the Stamp Act and subsequent parliamentary acts. In 1775, patriots drove Josiah Martin, the royal governor, from the capital, forcing him to seek refuge first in Fort Johnston and then finally on board a British warship. The military hardships of the war itself came to New Bern in August 1781, when Major James Craig led a British force of nearly 300 redcoats and 300 Tories from Wilmington to New Bern. On August 19, they entered the town, burned property and outlying plantations, and then returned to Wilmington.

After the Revolution, New Bern became the first place in North Carolina and the third place in America to celebrate Independence Day. North Carolina's capital moved to Raleigh in 1792, but New Bern enjoyed increasing prosperity as a thriving port town into the nineteenth century.

New England, Dominion of

Comprising all the English colonies of North America from north and east of the Delaware River, the Dominion of New England was created by James II in 1685. It was part of a larger plan developed in the late seventeenth century to re-establish royal control in England and the emerging British Empire, especially the American colonies.

The resolution to combine New England into a single province created a centralized political power and placed it in the hands of one royal governor and council appointed by the king. Local assemblies within the individual colonies ceased to exist, with control over the colony diverted to the governor and council. This centralized government held complete executive and legislative authority over the people who lived within its jurisdiction, a vast region stretching from New Hampshire to New Jersey.

On taking office, the new government caused turmoil among the local inhabitants by providing freedom of worship to everyone, restricting the number of traditional town meetings to once a year, actively enforcing the Navigation Acts, and issuing land grants only in the king's name. After James II's removal and William and Mary's ascendance to the throne in 1688, the duration of the Dominion effectively ended.

Although the life span of the Dominion was short, it spawned sporadic but decisive reactions in the American colonies. In New York and Massachusetts, local leaders staged revolts partly to protest the expansion of royal authority in the new governor and partly in support of the largely peaceful Glorious Revolution of 1689, which brought William of Orange to the throne.

In Boston, after they received news of the accession, it took nearly three weeks for local elites to raise a popular revolt on April 18, 1689. Boston's revolt, justified by a number of reasons, essentially destroyed the entire Dominion of New England. Regardless of the motivation behind the revolt, the result was that Sir Edmund Andros, the royal governor of the Dominion, was officially deposed and the old charter of Massachusetts restored.

By the end of 1689, every colonial assembly in New England had been reinstated. Expediency, unfair preferential treatment, the ascension of William and Mary, and imitation of Massachusetts all led to the revival of the old charters in every colony of New England except New York. Being a proprietary colony of James II, New York had no charter to restore. Here, a popularly supported revolt under the direction of local leaders like Jacob Leisler raised the militia and forced Francis Nicholson, the lieutenant governor in charge of New York, out of the region.

Unfortunately, subsequent events led to the execution of Leisler, the limitation of the new Massachusetts charter, and the exoneration of both Andros and Nicholson. Despite efforts to restore the past, the economic and political autonomy of the early days of the Northern colonies did not return.

New Hampshire

The first settlement in New Hampshire was the result of a 6,000-acre land grant to David Thomson in 1622. Thomson and a small group of settlers

arrived aboard the *Jonathan* on April 16, 1623, and began a settlement at Odiorne's Point. Although some of the colonists remained, Thomson abandoned the colony and his claim to it. In 1629, the Crown granted the same land to Captain John Mason, who named his holdings New Hampshire, after his home county in England.

The exact territory encompassed by Mason's grant was indistinct owing to multiple grants of the same territory in a short period of time. In addition to Mason's grant, the Crown awarded Mason and Ferdinando Gorges the lands called Laconia, which bordered New Hampshire on the north and west. A third grant, the Squamscott Patent, went to Edward Hilton, one of the original settlers who arrived with Thomson. Yet another grant given to Mason, Gorges, and several others, the Pascataway Patent, encompassed much of the same territory.

In 1691, Samuel Allen purchased Mason's original land grant, but Allen failed to obtain approval from the settlers, and the Privy Council voided the transaction in 1739. In 1746, John Tufton Mason, the legal heir, sold all claims to New Hampshire to a group of twelve Portsmouth citizens, finally settling the disputes over who owned the patent.

Most of New Hampshire's population resided in one of four towns in the colony until the middle of the seventeenth century. Originally settled in 1623, Portsmouth was incorporated as a town in 1631 and served as the government center for the colony. Dover, the original 1623 location, was established by Thomson. Exeter was begun by Massachusetts exile John Wheelwright in 1638, and Hampton was founded by the Bay Colony under the guidance of Reverend Stephen Bachiler.

Government

For much of its early history, New Hampshire was intricately linked with Massachusetts. By 1643, the colony's four towns had willingly placed themselves under the jurisdiction of Massachusetts. This arrangement continued until disputes over the land grants prompted the Crown to establish New Hampshire as a separate royal colony in 1679.

With the establishment of New Hampshire as a royal colony, John Cutt of Portsmouth was named president of the Council, which served as the colony's executive body and was composed of nine men, six appointed by the Crown and three appointed by the king's six appointees. A legislative body known as the Assembly was made up of delegates elected from the towns. The king retained the power to veto the Assembly's actions.

The colonial government adopted New Hampshire's first legal code, nearly identical to Massachusetts law, in 1680. It provided for the definition and punishment of fourteen capital crimes, a court system, trial by jury, and a militia. It also defined voters as Protestant males over the age of 24 and owning a taxable estate worth 20 pounds.

In 1685, James II took over the reorganization of the New England colonies that had been begun by his brother, Charles II. Under this plan, all of the Northern colonies became the Dominion of New England and subject to a royal governor. Edmund Andros became the governor and established a central government at Boston. During this time, Andros exerted absolute authority. New taxes were imposed, and town meetings were forbidden. Churches were prohibited from collecting tithes to pay their ministers' salaries.

Andros was removed from power in 1689, when the colonists received word that the overthrow of James II was imminent. New Hampshire returned to its earlier arrangement with Massachusetts, requesting its government and protection. That arrangement lasted until a royal charter in 1691 again recognized New Hampshire as a separate colony.

Warfare

Much of New Hampshire's history is marked by wars with the native peoples. This began with King William's War in 1689. New Hampshire was positioned on the frontier of the dispute over the Canadian border. Its towns were attacked by French troops and their native allies, and the colony's men fought with the English.

A brief period of peace followed until the outbreak of war again in 1702. Queen Anne's War renewed the hostilities with France and again subjected New Hampshire to native raids throughout the colony. Again, men and money were contributed.

Following this conflict, New Hampshire enjoyed a relatively lengthy period of peace until local issues between the colonists and Native Americans again embroiled them in war. The series of battles that took place between the English and the French and their native allies during 1724–1725 was known as Dummer's War, after William Dummer, governor of the Massachusetts Bay Colony.

King George's War, fought in the American colonies from 1744 to 1748, disrupted the peace once more. A regiment from New Hampshire was involved in the capture of Louisbourg, a French stronghold that guarded Canada. Following this, a brief period of quiet reigned until the French and Indian War began in 1754. As it had in the previous wars, New Hampshire contributed its resources to the defense of England. Following the conclusion of this armed combat, New Hampshire would not fight again until the American Revolution began in 1775.

Economy

New Hampshire grew quickly. By 1763, its population had reached roughly 30,000, and, in 1761, it boasted 61 towns. A rapid expansion between 1760 and 1775 generated another eighty-six new townships. This growth stemmed primarily from new populations, including a large number of Scots-Irish settlers. In addition, the Privy Council's decision to fix the boundary between New Hampshire and Massachusetts in 1740 increased the colony by 3,500 square miles.

The economy boasted three sectors. Maritime vocations bolstered much of the economy, and an abundance of fish spurred the growth of fisheries. Trade, too, was an important ingredient in the colonial economy. Furs and fish were traded, but New Hampshire's primary trade came from its involvement in slavery; large purchases of sugar produced by slaves in the West Indies were distilled into rum and exported to Europe. Shipbuilding also flourished in New Hampshire. In addition to the building of the ships, a variety of industries associated with ships developed, including the manufacture of rope walks

and sails, and commerce in imported goods.

Lumber was also important to the economy. Raw lumber for building was exported in significant amounts. Maple sugar became a popular export as colonists learned how to produce it from the abundant trees. New Hampshire also became the leading producer of ships' masts, due to the availability of large timber from which to create the massive center beams. As a result, the state eventually acquired a near monopoly on ships' masts for all of New England. Finally, a small business and professional class, including some printers and lawyers, also contributed to the economy.

Society

New Hampshire did not place the emphasis on religion that some colonies did. From its inception, a number of denominations—Anglicans, Puritans, Quakers, Baptists, and Presbyterians—resided there. The outbreak of revival in the 1730s, known as the Great Awakening, did affect the colony. George Whitefield, the popular evangelist who spread the revivals throughout the colonies, visited New Hampshire in 1740 and 1744. This religious fervor resulted in the founding of Dartmouth College in 1769.

Because of its close association with Massachusetts, New Hampshire adopted a similar emphasis on education. Towns were required to maintain public schools. Dartmouth College, while initially meant only to train Native Americans as missionaries to their own people, soon became an institution of higher education.

American Revolution

New Hampshire quickly became involved in the Revolutionary movement that led to independence. In 1773, the colony established a standing Committee of Correspondence that operated throughout the war. The following year, the colonial assembly voted to dissolve the royal government. This body would meet throughout the war to decide on contributions to the war effort and work out a new plan of government.

In December 1774, a group of New Hampshire men seized Fort William and Mary and the stores of weapons it housed. These weapons were distributed to towns throughout the colony and were eventually used in the war.

The committee met in January 1775 to approve the actions of the Continental Congress and conduct other business related to the war effort. At the fourth meeting of the committee, conducted just after the outbreak of war in May 1775, the body voted to establish a provincial post office system and an army of 2,000 men. New Hampshire was able to contribute men with considerable military experience to the war effort. In July, the colonial assembly established the First Provincial Congress to govern the colony.

In addition to fighting the war against England, New Hampshire also worked to revamp its frame of government. Under the new system that emerged after the Revolution, the franchise was expanded to include all taxpayers, and the property requirements for officeholders were significantly reduced. Each town was granted one assemblyman per 100 freemen in the House of Representatives. Members of this lower legislative body were responsible for electing the upper house, known as the Council. All state officers were elected by both legislative bodies, in part, because the new government made no provision for an executive officer. There was also no established judicial system.

New Hampshire was the first state to establish a separate government, and, on June 15, 1776, it declared its formal independence from England. While the Provincial Congress had acted quickly, the voters were not so quick to accept the new government. A series of constitutional conventions beginning in 1778 worked to revise the government. A new constitution was finally approved and put into effect in July 1784.

New Haven

New Haven is a port city located in New Haven County, in southern Connecticut, where the Quinnipiac River and other small rivers flow into Long Island Sound. When the first Europeans arrived in the seventeenth century, the Quinnipiac Indians were inhabiting the area. They were semi-sedentary, hunting wild animals such as deer and fowl, harvesting shellfish and scaled fish, and collecting roots, nuts, and fruits. They also cultivated corn, beans, and squash

to supplement their diet.

In 1638, Theophilus Eaton and the Reverend John Davenport left Boston with a company of about 500 Puritans and sailed into New Haven harbor. After learning that the Mohawk and Pequot tribes were threatening the Quinnipiack and other tribes in the area, the Puritan colonists purchased land from Momauguin, the leader of the Quinnipiack, offering a small assortment of European goods and protection against raids by other native peoples.

The colony had no official charter, so the colonists met on June 4, 1639, to establish a government and church polity similar to the Massachusetts model. The following year, they renamed the settlement New Haven, and, by 1641, the town had grown to about 800 settlers. Built on a grid of nine squares, the central grid was designated the "market place," a public area now called The Green. The colony soon expanded to include a series of detached settlements along Long Island Sound, such as Guilford, Branford, Milford, and Stamford; Southold, on the eastern end of Long Island; and settlements as far away as present-day Salem, New Jersey.

With New Haven's fine natural harbor, the first settlers had predicted that their town would grow into a prosperous, commercial seaport. The sudden decline in the number of new immigrants coming to New England and Boston's predominance in commercial trade with Britain, however, hampered any prospect of New Haven becoming a commercial hub in the Atlantic world. After failing to establish a direct trade route to England in 1646, the settlement evolved into a small agricultural seaport town, overshadowed by the commercial seaports of Boston and New Amsterdam.

During the British Civil Wars, New Haven supported the parliamentary side; after the restoration of Charles II, it became the refuge of three regicide judges, Edward Whalley, William Goffe, and John Dixwell. John Davenport, as it was later revealed, hid the regicides in a cave on West Rock, where they eluded the king's officials. After changing their identities, Whalley and Goffe settled in Hartford and then Massachusetts, and Dixwell settled in New Haven.

It was around this time that Charles II gave his brother James, the Duke of York, the lands between the Delaware and Connecticut Rivers. After James seized New Amsterdam in 1664, the New Haven Colony, fearing a union with New York under the rule of a Catholic regent, reluctantly agreed to merge with the colony of Connecticut under the Charter of 1662. With the establishment of the Dominion of New England in 1688, James annulled the colony's charter, but it was reinstated by William and Mary following the Glorious Revolution in 1689.

At the turn of the century, a small group of Puritan congregationalists founded a college for training the ministry. Having opened its doors at Killingsworth (now Clinton) in 1702 as the Collegiate School, five years later, the college moved to Saybrook (now Old Saybrook). In 1716, the college was relocated to New Haven. After receiving a large benefaction from Elihu Yale in 1718, it was renamed Yale College. During the colonial period, Yale expanded its studies and eventually gained recognition as one of the world's leading universities.

Although New Haven was not as prosperous or as strategic as the seaports of Boston, New York, Philadelphia, and Charles Town, it was nonetheless raided by British and Hessian forces during the American Revolution and occupied for a brief period. The patriots of New Haven, including the old Reverend Naphtali Daggett, put up a brave fight, but they were overwhelmed by the strength of the British, who routed them and left the town partially burnt. After the Revolution, the Connecticut Assembly appointed Roger Sherman, New Haven's mayor, to the Constitutional Convention at Philadelphia. As one of the framers of the U.S. Constitution, Sherman was the delegate who put forth the Connecticut Compromise, an alternative to the Virginia Plan, whereby smaller states were to receive equal representation in the upper house. The proposal was accepted, and the idea of unicameral legislature was abandoned in favor of a bicameral congressional government.

As a commercial and agricultural center during the eighteenth century, New Haven grew into a relatively prosperous town. By the end of the colonial period, it had about 3,500 inhabitants and was, together with Hartford, the co-capital of Connecticut, a position it maintained until the second half of the nineteenth century.

With Eli Whitney's invention of the cotton gin in 1793, and with his firearms and ammunition company, the city emerged as a leading manufacturing center during the early republic. In 1808, James Brewster introduced the first assembly line at his famous New Haven carriage factory, and other industries and businesses flourished in the area.

The city, moreover, took a leading role in the abolition movement. It is well known for the Amistad incident of 1839, in which nearly fifty African Mendi slaves, captured by the Spanish, were given safe passage back to Africa by the Federal District Court in New Haven.

New Jersey

Benjamin Franklin supposedly described New Jersey as a “barrel tapped at both ends.” Because of its location between Pennsylvania and New York, the importance of the Hudson and Delaware Rivers to colonial commerce, and the influence of Philadelphia and New York City, Franklin was largely correct. European settlers entered New Jersey through the ports of its more famous neighbors, and much of New Jersey's commerce depended on merchants in Philadelphia and New York.

As in the other Middle colonies, ethnic and religious diversity characterized settlements in New Jersey. East Jersey's diversity mirrored that of New York and West Jersey's diversity mirrored that of Pennsylvania. Despite the important influences of New York and Pennsylvania, a unique history nonetheless characterized colonial New Jersey.

Dominion

Henry Hudson explored the Delaware Bay and the Hudson River in 1609, laying the basis for Dutch claims to lands in the Delaware and Hudson River Valleys. Beginning in the 1610s, the Dutch West India Company financed settlements in New Netherland. The great majority of Europeans who settled in New Netherland, however, favored settlement in the Hudson Valley in what would become the English colony of New York. Until the 1660s, the Dutch presence in Jersey remained minimal, confined to a string of forts, trading posts, and settlements along the Delaware River and a few Dutch settlements across the Hudson River from New Amsterdam.

The Georgian-style Ford Mansion in Morristown, New Jersey, which served as General George Washington's military headquarters in the winter of 1779–1780, is one of that state's great landmarks of the Revolutionary War. (Courtesy of Morristown National Historical Park)

In the 1650s, England began to challenge Dutch commercial superiority, and, in 1664, King Charles II of England granted his brother James Stuart, Duke of York, a colony stretching from the Connecticut to the Delaware Rivers. Shortly thereafter, an English fleet forced the Dutch governor of New Netherland to recognize English claims to “New York,” establishing English dominion over what would become New York, New Jersey, Pennsylvania, and Delaware.

The Duke of York promptly granted the part of his claim that would become New Jersey to two nobles as a reward for their support of the Stuart family. As proprietors of New Jersey, Lord John Berkeley and Sir George Carteret enjoyed the rights to all of New Jersey's lands, along with the exclusive right to govern the colony. In 1676, after Quaker investors purchased Berkeley's claim, Berkeley and Carteret divided the colony into the provinces of East and West Jersey, and ownership of West Jersey soon devolved into the hands of over 100 Quaker shareholders. On Carteret's death in 1682, his heirs sold his claims to groups of speculators. By 1685, the East Jersey Proprietors, a small group of Scots who aimed to recreate the near feudal system of social, political, and economic relations of Northern Scotland in East Jersey, assumed control of Carteret's half of the Jersey colony.

Confusion over who possessed rightful claims to govern the Jerseys launched politics into a state of constant confusion. Puritans, Dutch, and other settlers refused to recognize the legitimacy of the proprietors' governments, a situation compounded by the constant infighting among the proprietors themselves. Finally, in 1702, English officials pressured the various proprietors and investors to cede their claims to govern the Jerseys to the Crown, though the proprietors and shareholders retained the rights to their Jersey land claims. New Jersey then became a royal colony, governed by a Crown-

appointed governor, an executive council, and an elective assembly. Reflecting the earlier division of the colony, New Jersey had two colonial capitals, Perth Amboy in the east and Burlington in the west, with the yearly assembly alternating between the two.

Peoples, Settlement, and Development

Perhaps 10,000 Lenni Lenapes occupied New Jersey at the time of European contact. Like many Woodlands peoples, the Lenni Lenape lived in semipermanent agricultural villages and spent part of the year hunting, fishing, and trading.

In the early 1600s, New Jersey Indians began trading with Dutch and Swedish outposts along the Delaware and Hudson Rivers. But even prior to the appearance of European traders along the Delaware, disease and war with the Iroquois of upstate New York decimated their population. Many Lenni Lenapes responded to these pressures on their population by joining other native nations and tribes in Pennsylvania and New York. The colony's European population had swelled to nearly 14,000 by 1700, placing further pressure on the native population. The Lenni Lenape continued to sell land—often under duress—and to move out of the colony in hopes of incorporating themselves into other tribes and consolidating their power. By 1763, fewer than 1,000 Native Americans lived in New Jersey.

Close proximity to Pennsylvania and New York shaped European settlement patterns in East and West Jersey. Many Quakers called West Jersey home, as did small enclaves of Dutch, Swedish, and Finnish settlers, remnants of the brief period of Dutch and Swedish colonization along the lower Delaware. Beginning in the 1720s, after entering the colonies at the port of Philadelphia, significant numbers of Germans and Scots-Irish Presbyterians settled in West Jersey.

East Jersey was even more diverse. Beginning in the 1660s, many of the inhabitants of New Netherland—a motley assortment of Flemings, Walloons, French Huguenots, German Protestants, Dutch, and their African and African American slaves—spilled over into East Jersey from New York. Non-Quaker English, New England Puritans, Scottish, and Scots-Irish emigrants also settled in East Jersey. Finally, Quakers and Baptists seeking refuge from religious persecution in New England added to the religious diversity of East Jersey. In the 1720s, the Great Awakening—a series of religious revivals—arose amid this potent religious and ethnic brew, adding to the colony's religious diversity.

The importance of religion in colonial New Jersey profoundly affected the lives of women, particularly Quakers and Puritans. Over time, they used their place in religious life to gain greater authority in the church and family.

New Jersey was the most diverse colony in terms of both religion and ethnicity, even more than its diverse neighbors, New York and Pennsylvania. Diversity did not necessarily lead to the creation of a cohesive culture, however. New Jersey's ethnic and religious groups tended to settle in homogeneous communities, allowing them to preserve many features of their culture and institutions. Similarly, the concentration of New Jersey's African and African American population in two northeastern counties allowed for the creation and preservation of a distinct, Northern African American culture.

Most white Jersey families sought ownership of land, and they expected to provide a landed inheritance for all of their children. New York and Philadelphia merchants' demand for Jersey's agricultural products created a prosperous economy that allowed most European families to obtain the land that alone provided independence and economic security. To supplement family labor, they turned to free and unfree labor of indentured servants and, in northern Jersey, enslaved Africans and African Americans. Often unable to gain their freedom during the colonial period, slaves instead forged extended family ties and sought greater personal freedoms within the institution of slavery.

Politics and Authority

Most of the European population could reasonably expect to own land at some time in their lives, and, with it, the right to participate in their own governance. The ethnically and religiously homogenous townships that dotted New Jersey were essentially self-governing, run by local notables with the consent of the freeholders, the property-holding adult white men of the community. In most cases, the freeholders selected prominent locals of similar ethnic and religious backgrounds to govern their communities and represent their interests in the colonial assembly. The assembly spent much of its time acting on local petitions, trying to mediate, often unsuccessfully, disputes between various landed, commercial, and political interests.

Leading local men and the electorate shared a host of common interests, ranging from resistance to the Anglican Church, resistance to the royal governor, and resistance to the proprietors, who claimed large portions of the colony on the basis of the proprietary charters. Politics was especially important in East Jersey, as local leaders and the freeholders sought to defend the values and interests of their communities against groups with conflicting values and interests, such as the proprietors. The relationship between the electorate and leading local men remained complex and deferential, but local leaders actively sought the support of the "people," in part to shore up their own political influence against the governor, the proprietors, and other officeholders.

In West Jersey, wealthy Quaker merchants centered in Burlington exercised considerable economic and political power. In East Jersey, proprietors who held tracts of land measured in the thousands and tens of thousands of acres sought to use their wealth, influence, and political power to create a more hierarchical society. In doing so, they generated sustained conflicts that pitted small landowners and locally prominent men against the "gentlemen" proprietors.

Conflicts over land titles had sporadically plagued East Jersey since the 1660s, when Puritan farmers rebelled against proprietors who tried to claim Puritan lands around Elizabethtown and Newark. Beginning in the 1740s, the problem spread, as the proprietors began to challenge the legitimacy of land titles throughout northern Jersey. In some cases entire townships found their land deeds contested by proprietors and land companies, and, by 1745, upwards of 500,000 acres of Jersey land titles came under suspicion. Actual settlers, who had purchased their land in good faith and then made settlement and improvements, faced the prospect of proving the legitimacy of their titles in costly court cases against well-funded proprietors.

Small farmers, and in some cases their wives, joined with local leaders in land riots to retain possession of their land and protect their community from threatening outside forces. The land rioters' objective was to retain possession of the title to their lands by intimidating the proprietors and their agents, forestalling court hearings, preventing the enforcement of evictions, and preventing resettlement of seized lands. By and large, the land rioters succeeded in defending their land titles from the proprietors.

The unique history of colonial New Jersey continued to shape events during the Revolution and in the early national period. Some great landholders became loyalists, while many land rioters became patriots, sustaining political divisions through the early national period. Finally, prosperity and diversity, fed by proximity to New York City and Philadelphia, continued to characterize the state.

New Mexico

By the time a Spanish expedition crossed the Rio Grande into what is now New Mexico, Pueblo Indians had been living in a string of settlements from El Paso to Taos for more than three centuries. The story of colonial New Mexico is, at its core, the struggle of autonomous Pueblo villages to resist Spanish military force and cultural conquest from 1540 to 1846, when the United States took control of the region.

The Rio Grande Valley was home to between sixty and seventy independent native communities, totaling less than 40,000 people, when Francisco Vázquez de Coronado approached it from Mexico in 1540. The independent pueblo was the main unit of political organization, and the pueblos had relatively little contact with one another. The Pueblo peoples of New Mexico spoke at least five mutually unintelligible languages (Tiwa, Tewa, Piro, Tano, and Keresan), and each language was broken down further into dialects. The Pueblo were farmers, who had mastered the skill of raising crops in a harsh, unforgiving climate.

Like Hernando de Soto, who was cutting a path of destruction through the Southeast at the same time, Coronado had no system of conquest. He moved through Pueblo country with 300 Spanish soldiers and Christianized native servants. After establishing a base camp near modern-day Albuquerque, Coronado required local Tiwas to furnish his army with food, clothing, and women. Not surprisingly, the Tiwa resisted Coronado's demands; Coronado responded by burning 200 of the native people at the stake. Ten of twelve Tiwa villages were ultimately abandoned as a result of the fighting with the Spanish; the remaining two were conquered. Although Coronado left New Mexico as soon he learned that there was no treasure to be had, the Spanish gained a reputation for violence among the Pueblo.

In 1598, Juan de Oñate brought a different style of Spanish colonization to New Mexico. After declaring all of New Mexico to be under Spanish rule, he assembled Pueblo leaders at several locations along the Rio Grande to inform them of the benefits of Spanish rule. Chief among these benefits were peace, justice, new crops, livestock, and trade. Oñate also indicated that if the Pueblo would submit to the Catholic Church, they could avoid an eternity of suffering.

Spanish records indicate that the Pueblo agreed on the spot to become servants of the Spanish Crown and the church; however, Oñate's tenure as governor of New Mexico was marked by constant violence between the Pueblo and their Spanish masters. When Oñate's own nephew was killed in a surprise attack, the governor responded ferociously. Spanish forces overwhelmed the people of Acoma Pueblo, killing 500 men and 300 women and children. Some 80 men and 500 women and children stood trial; many of these had their feet cut off, and all were forced into twenty years of servitude. Powers in Mexico City eventually brought Oñate up on charges of cruelty and adultery.

New Mexico's native people were caught in a conflict between the colony's civil and ecclesiastical authorities. Various governors tried to reduce the power of the missions. The more the Pueblo people worked on missions, the less they could contribute to the colony's labor supply, thereby robbing the colony's government of valuable resources. Missionaries and governors accused each other of using native labor for personal gain. In reality, both sides abused the Pueblo, and, between 1630 and 1680, the situation deteriorated rapidly. Missionaries embarked on a new program to crush native religion by force. At the same time, warfare between the Pueblo and Apache was intensifying.

All these forces came to a head in the Pueblo Revolt of 1680. The Pueblo began the revolt by killing missionaries and all the Spaniards they could find. Then, they laid siege to Santa Fe. Within a matter of days, all the missions had been destroyed; and half of the forty or so priests and hundreds of Spanish colonists had been killed. The surviving Spanish colonists left for El Paso, where they stayed for twelve years. The Pueblo Revolt marked the first time that Pueblo peoples from different regions had acted in concert toward a single goal.

The Spanish reconquest of New Mexico began in 1692. Eventually, Spain did regain control of the Pueblo. Still, the first half of the eighteenth century was marked by factional strife between the various pueblos and simmering conflict between the Spanish and the Pueblo people. Missionaries reconsidered their attempt to quell native religion, and they stopped confiscating ceremonial objects. In the second half of the eighteenth century and beyond, Spain's influence on New Mexico, and indeed its influence in the Americas as a whole, markedly declined.

New Netherland

New Netherland was a prominent Dutch colony in North America in the early seventeenth century. The Dutch sought to trade for furs with native peoples and established trading posts at the mouth of the Hudson River (New Amsterdam) and 150 miles upriver (Fort Nassau). In 1664, England seized the colony and renamed these settlements New York and Albany, respectively.

Algonquin Indians had moved into the area that became New Netherland by 1000 c.e., and Iroquois Indians had entered the region around 1300 c.e. By the early seventeenth century, the Algonquin occupied the lower Hudson River Valley, while the Mohawk of the Iroquois League occupied the upper Hudson River region.

The Dutch colony of New Netherland—mapped here in 1656, eight years before its capture by the English—extended from northern Delaware and New Jersey through Manhattan Island and up the Hudson River to modern-day Albany. (Brown Brothers, Sterling, Pennsylvania)

Dutch Colonization

The Netherlands were a leading economic power by the early seventeenth century, and Dutch colonization efforts in America emphasized commerce over extensive settlement. In 1609, Englishman Henry Hudson, employed by the Dutch, sailed his ship the *Half Moon* up the river to be named for him. Within a year, the Dutch began trading trinkets, guns, and alcohol with the native peoples along the Hudson River for furs. In 1614, the Dutch established Fort Nassau (Albany) on the river. Prominent Dutch traders tried to control the early fur trade in the region.

In 1621, the Dutch government granted a charter to the West India Company allowing the company to monopolize trade and shipping in the Dutch regions of the Americas and West Africa and to establish military and civil bodies to oversee its holdings. The company sought to populate its North American territory to counter English and French claims to the region. In 1624, it brought thirty French-speaking Walloons from southern Belgium to the Hudson River Valley and founded the colony of New Netherland. Because the Dutch economy was prosperous at this time, few Dutch settlers wanted to go to America. Thus, New Netherland contained an ethnically diverse population from its inception, a primary feature of the colony throughout the period of Dutch control. Cornelis Jacobsz May became the first director-general of New Netherland in 1624. The company re-established Fort Nassau as Fort Orange and ordered the construction of Fort New Amsterdam (later New York City) at the mouth of the Hudson on Manhattan Island. By 1625, New Amsterdam contained about 270 colonists, Fort Orange 30. Most of the early settlers were Walloons, but others were Dutch, German, Scandinavian, and African.

The company granted extensive power to the director-general and allowed very little political participation by the colonists. Willem Verhulst succeeded May as director-general in 1625, and Peter Minuit succeeded Verhulst a year later. In 1626, Minuit purchased Manhattan from the Manhat Indians (also known as the Rechgawawank) for trinkets valued at 60 guilders (about 24 dollars or the equivalent of several thousand dollars today). The Mohawk Indians supplied the Dutch with beaver pelts for trade, and this became a leading commodity of New Netherland. Although the Dutch government granted the company a monopoly on trade, colonists almost immediately began trading illegally with the Native Americans.

The Dutch government remained concerned at New Netherland's small population and, in 1628, adopted the first patroonship plan. It granted patroons—wealthy men willing to sponsor colonial settlement—large tracts of land along the Hudson River if they brought sixty immigrants to New Netherland within three years. The 1629 Charter of Freedoms and Exemptions increased the incentives offered to patroons by allowing them access to the fur trade.

Several men took advantage of this plan, but, by 1636, only Kiliaen van Rensselaer retained his patroonship. The others became discouraged and returned their lands to the company. Rensselaer established Rensselaerswyck near Fort Orange. Most of the settlers in New Netherland during this early period were single men, as Rensselaer offered skilled workers and professionals wages that were higher than those in Holland.

The West India Company brought eleven African slaves to the colony in 1626. Slave importations, most from the Dutch colony of Curaçao, became a key part of the region's economy, as New Netherland relied on slave labor more than any other North American colony in the first half of the seventeenth

century. By 1640, New Amsterdam contained roughly 100 Africans—a third of its total population. The company allowed slaves to live on their own and required payment for work performed. These relatively independent slaves learned the Dutch language, purchased property, and established families in New Netherland. In some cases, the company freed its slaves, particularly less productive, aging slaves, and a free black population developed.

Black residents could sue in Dutch courts, marry, baptize their children into the Dutch Reformed Church, and fight in defense of the colony. As the company's control over the colony weakened, individual settlers began importing slaves directly from Africa in 1655. These slaves had fewer liberties than the company slaves and encountered greater barriers to gaining their freedom. Although Dutch slave traders resold many slaves to Virginia and Maryland colonists, many remained in New Netherland. By the English takeover in 1664, one fifth of New Amsterdam's population was African. Of the city's 375 black residents, 75 were free.

The company recalled Minuit in 1631. Jansen Kroll replaced him but remained only a year; he was succeeded as director-general by Wouter van Twiller in 1633. Van Twiller's drunken behavior and poor accounting practices convinced the company to replace him with Willem Kieft in 1638. Kieft was the most dictatorial of these men but saw dramatic population growth during his tenure because the Dutch government issued the Freedoms and Exemptions Act of 1640, promising 200 acres to each colonist who brought five Europeans to New Netherland. The colony's European population doubled between 1638 and 1643.

Relations between local natives and the Dutch soured under Kieft, and war broke out in the early 1640s. Kieft angered the Algonquin people in 1639 by imposing a tax on them, and he overreacted to a few native raids in the summer of 1641 by attacking Algonquin villages. In 1643, Kieft and his men massacred more than 100 friendly natives. In response, the Algonquin attacked outlying farms. By its end in 1645, the war had claimed the lives of 200 colonists and approximately 1,000 Native Americans, including women, children, and the elderly. Many surviving colonists moved to fortified New Amsterdam.

In 1646, the company recalled Kieft, and Peter Stuyvesant became director-general in 1647. Stuyvesant's tenure was fraught with conflict. He fought with colonists over taxes and political participation, with the company over religious toleration, with the Dutch government over judicial matters, and with Rensselaerswyck over trade in the Fort Orange area. The authoritarian Stuyvesant began extensive reforms in New Netherland, including the creation of strict fire codes, price controls on bread, and enforcement of laws against smuggling and liquor sales to the native peoples. He also required attendance at Sunday religious services.

Relations with New England

Relations between New Netherland and New England to the east deteriorated as the colonies spread toward one another and as the home countries engaged in a series of wars in the 1650s and 1660s. Overlapping Dutch and English land claims in America became such an acute problem that leaders signed a 1650 agreement setting the border 10 miles east of the Hudson River. Although this line was generous to New England, English settlers began to move across it within a few years. Several English Puritan communities had formed on Long Island also, and these insisted that Stuyvesant allow them town meetings. He ignored their demands, but such attitudes spread to Dutch settlements and further undermined his authority.

Stuyvesant encountered other problems as well. New Sweden seized a Dutch fort on the Delaware River in 1654. The following year, Stuyvesant led 600 men against the Swedes, who peacefully agreed to Dutch rule. While Stuyvesant was absent, Algonquin Indians attacked the farms of several colonists. The ensuing war caused much property damage and cost the lives of fifty colonists and sixty natives. Stuyvesant hurried back to end the conflict and recover hostages. He banned the creation of outlying settlements and fortified the defenses of New Amsterdam.

By 1664, New Netherland's population was approximately two-thirds Dutch. The colony also contained English, German, French, Finnish, and Jewish settlers. This diverse population had little loyalty to the company or the Dutch government, and many colonists disliked Stuyvesant's authoritarian rule. That year, King Charles II of England granted the region to his brother, James, Duke of York. James sent four ships under Colonel Richard Nicolls to New Netherland demanding its surrender. Although Stuyvesant wanted to resist, he received no support from the townspeople. Focused on trade, they held little allegiance to the Netherlands. When Nicolls informed them that they would retain commercial and political rights, they agreed to English rule, and James renamed the colony New York. New Amsterdam became New York City and Fort Orange became Albany.

Dutch influences remained in New York after the English takeover. Place names such as Breukelyn (Brooklyn) and Haerlem (Harlem) continued with only slight modification. Most settlers stayed in the colony, as did Stuyvesant. During a subsequent English-Dutch war, the colony briefly reverted to Dutch rule in 1673. The following year, the Dutch signed a treaty surrendering all claim to New York forever.

New Orleans

Although the French explored the area that now encompasses coastal Louisiana as early as 1682, settlement of Louisiana did not begin until 1718, when Pierre le Moyne, Sieur d'Iberville, founded the city of New Orleans. Despite the richness of the Louisiana territories, France never exploited the region to its fullest, leaving New Orleans and most of Louisiana a sparsely settled backwater.

Although it was not the first French settlement in the region, New Orleans became its capital in 1722, since it controlled access to the largest water route into the American interior. The original layout of New Orleans was a gridiron (see plan on page 608) that fell within a bend of the Mississippi River. This area, now called the Vieux Carré, or French Quarter, formed the main city limits until the nineteenth century.

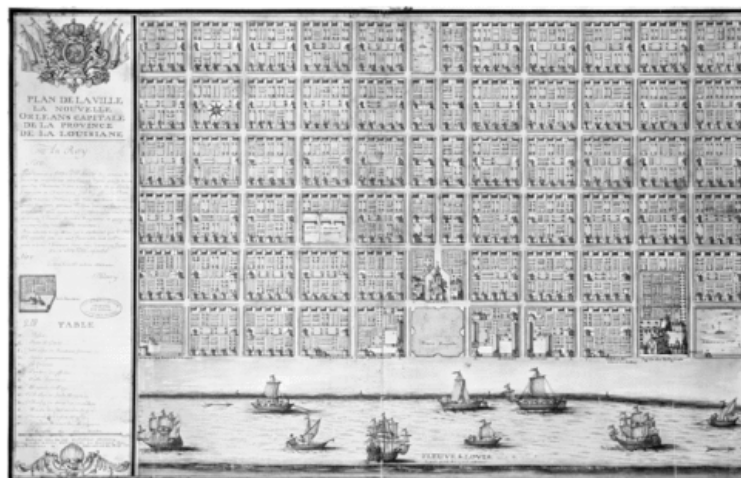

The Louisiana colony was first proprietary and then a corporate colony before becoming a royal province in 1732. The population of French Louisiana was remarkably diverse, ranging from French settlers and soldiers to German immigrants to Native American slaves and hunters and, finally, African slaves, who, by the early 1730s, clearly outnumbered the European colonists. The settlers around New Orleans raised tobacco and indigo as cash crops, but the main economy depended on the work of a combined group (European, Native Americans, and African), who farmed, herded, fished, hunted, and traded with nearby natives for deerskins.

Spain won control of the city after the Seven Years' War (known as the French and Indian War in America), and it remained in their possession until 1800, when it was ceded back to France. In 1803, New Orleans was sold to the United States by Napoleon Bonaparte as part of the Louisiana Purchase. In 1815, British military forces under General Edwin Pakenham attempted to seize New Orleans, but they were defeated by Andrew Jackson and a combined force of frontier militiamen, Creole aristocrats, free blacks, and pirates.

Like other Southern cities, New Orleans experienced a substantial growth in its population of mulattos and other free persons of color, which became a serious problem due to the inability of its white leaders to deal fairly with racial issues. Although New Orleans had always had a very diverse population, the result was the nineteenth-century emergence of highly delineated segregation. Those with white skin held the top tier, while blacks, regardless of condition, were pushed to the bottom. Mulattos became a virtual third caste within society, precariously stationed in an ambiguous position somewhere in between, not quite white and not quite black.

Most free blacks and many mulattos were skilled artisans (blacksmiths, carpenters, cobblers, and so on), farmers, or common laborers. Others supported themselves and their families as fishermen or hunters. A few New Orleans mulatto families became quite rich, generally operating businesses—such as stores, hotels, and barbershops—that served whites exclusively. Some free blacks, like Cyprien Richard, even became slaveholders.

Solomon K. Smith

French colonial New Orleans was one of America's first planned cities, laid out by military engineers in 1718. The simple rectilinear pattern remains visible today in the Vieux Carré, or French Quarter. (Giraudon/Bridgeman Art Library)

New Spain

Of the Spanish viceroyalties established in the New World, New Spain and Peru, founded in 1535 and 1543, respectively, were the longest lasting.

The term “viceroyalty” designates an area ruled by a viceroy, who acts on behalf of the king in matters of government. Columbus, for instance, was the first viceroy of the Indies, but that position's power was sapped by the Council of the Indies. New Spain's viceroy also answered to the Council, and two viceroyalties were carved out during the eighteenth century—New Granada and La Plata.

The area known as New Spain—the modern nation of Mexico, a huge chunk of Central America, Spanish possessions in the Caribbean, and a large swath of the American Southwest and Florida—was home to hundreds of distinct Native American societies. These ranged from autonomous villages and chiefdoms to the massive state of Mexico centered at Tenochtitlán in Mexico's central valley.

Native Life and Conquest

Native life in the area that would become New Spain was extraordinarily diverse. In the thirteenth and fourteenth centuries, the Valley of Mexico was the site of a struggle for power between several rival peoples.

The Mexica people (often referred to as the Aztecs) came from the north to central Mexico sometime in the thirteenth century. After serving as mercenaries to Culhuacan and settling on land (Tenochtitlán) controlled by the Tepaneca, the Mexica rose to power through a series of marriage-based alliances, as well as success in trade and warfare.

By the middle of the fourteenth century, most groups in the region spoke the Nahuatl language, the language of the Mexica. Although they spoke similar languages, each Nahua polity retained its own elaborate musical and literary tradition, which helped to solidify its separate ethnic identity.

The Mexica developed a vast tributary empire at the same time as they adopted the strict social hierarchy that characterized the *altepetl* (Nahua polities). In this sense, the Mexica were not particularly innovative; they borrowed various practices from other neighboring groups and used them to their advantage. Society was divided into classes of nobles and commoners, and these divisions were apparent in education, work, and military service. Commoners could climb the social ladder through good marriages and military prowess.

The sacred center of Tenochtitlán was a stunning complex of pyramids, temples, royal palaces, and libraries. The city itself was constructed on a series of islands in a shallow lake and was home to approximately 200,000 residents at the time of the conquest. In comparison, Spain's largest city, Seville, had a population of around 70,000. The Mexica constructed a series of causeways and aqueducts to facilitate travel around Tenochtitlán and to bring fresh water to its residents. In the reign of Montezuma II (1502–1520), Aztec politics, religion, and economy were closely interrelated. All three would be permanently altered by contact with the Spanish in the 1510s.

The conquest of Mexico by the Spanish under Hernando Cortéz began in 1519 and was completed by 1521. In 1519 Cortéz led an unauthorized expedition from Cuba to the mainland. He, along with the soldiers under him, hoped that success would legitimate their actions. Using disgruntled Nahua allies, superior military technology, horses and war dogs, and a devastating smallpox epidemic, a relatively small Spanish force brought down the Aztec empire. They replaced the Aztec nobility with a Spanish ruling class—throwing Aztec priests and nobles to war dogs in many cases—installed Christian religious symbols in place of indigenous ones, and forced enslaved Nahuas to construct a cathedral and palace.

In 1535, the viceroyalty of New Spain was created to deal with the administrative problems brought on by the rapid expansion of the Spanish empire. The position of viceroy was given to Antonio de Mendoza, whose high social rank was intended to bring order to the chaos of the region, which had lapsed into a contest between several conquistadors.

By the time English colonies were founded on the East Coast of North America, Spanish viceroys presided over a large, land-based empire centered at Mexico City, which was home to a massive cathedral, a university, and a publishing house. From this base, New Spain would continue to grow throughout the colonial period, eventually encompassing much of the southwestern United States.

Exploration and Expansion

In the sixteenth century, Spanish expeditions fanned out from Mexico City to the south, west, and north. Most of these expeditions were undertaken in an effort to exploit New Spain's precious metals.

The earliest northern efforts, by Nuño de Guzmán and Francisco Vázquez de Coronado, failed to find any gold or silver. The second half of the sixteenth century was more productive. By the 1670s, silver strikes at Zacatecas, Guanajato, and San Luis Potosí had pushed silver production in New Spain past that of Peru. Native laborers and African slaves were brought north to work in and around the mines, and new cities appeared. Still, most of the wealth generated by the mines was funneled through Mexico City, which dwarfed other cities in New Spain in size and importance.

Society in New Spain was diverse. Most early African and Spanish immigrants were men, and many took native wives. Within a few generations, the result was a large class of mestizos and other mixed-race peoples, who contributed immensely to the development of a distinctly Mexican culture and what would eventually become the nation's character. Spanish and *criollo* (creole) officials encouraged native participation in religious festivals such as Corpus Christi and the ceremonies that accompanied the arrival of new viceroys. Throughout the colonial period, skin color continued to determine one's opportunities to a certain extent, but occupation, income, and cultural characteristics became more important over time.

In the seventeenth century, as central Mexico and outlying silver-producing areas grew in wealth and refinement, Spain began the slow, uneven process of exploring its northern frontier and exploiting the native people there. In 1598, Juan de Oñate took possession of New Mexico in an elaborate ceremony, but neither that colony nor other territories like Florida brought any real wealth to the Crown or to the individual nobles involved.

Northern New Spain remained firmly in native hands, though Franciscans, along with smaller numbers of Jesuits and soldiers, maintained tiny outposts throughout the region. Franciscans were particularly skilled at settling in the midst of large, sedentary native communities such as those of the Pueblo. The government of New Spain saw little economic opportunity in New Mexico, Arizona, Texas, and California. Missionary sects had more success in converting the native peoples in these frontier areas, as the missionaries did not have to compete with mine owners or ranchers.

As elsewhere, native people selected which parts of European religion to accept and which to reject and often made room in their indigenous worldviews for European saints and gods. In one partial exception to this rule, Pueblo Indians responded to a crackdown on their indigenous religion by rising up against the Spanish. The Pueblo Revolt of 1680 forced the Spanish to move south of the Rio Grande for more than a decade, while a retaliatory expedition returned to reconquer the area.

The wealth generated by New Spain encouraged other European nations, most notably France and England, to recognize the importance of overseas colonies. In the eighteenth century, northern New Spain was one of several entities competing for land and resources in North America. The French colony of Louisiana and English traders from Charles Town encroached upon Spanish soldiers and missionaries, but the English, in particular, were able to offer more trade goods and better prices than their Spanish counterparts. In the opening decade of the eighteenth century, the easternmost portion of New Spain was devastated in a series of attacks by the English and their native allies.

Mexico's fertile, populous central valley and the mining and agricultural areas that surrounded it continued to produce great wealth for the Spanish Crown. The portion of New Spain that exists within the borders of today's United States never prospered in the same way. Still, Spain exerted a cultural influence, particularly in the Southwest, which would be felt for centuries to come.

In the late eighteenth century, during the reign of Charles III, Spain attempted to modernize the institutions of its far-reaching empire. Collectively, these plans were known as the Bourbon reforms. Within New Spain, the reforms rankled elite and popular forces alike.

In the first decades of the nineteenth century, a new generation of New Spain's elites channeled their frustrations into a revolutionary movement that would eventually lead to the creation of the modern nation of Mexico.

New York

People of various ethnicities and races have influenced the culture, politics, and economics of the region that is now New York State. Before the arrival of Europeans, various native peoples lived there; some spoke dialects of a similar language, while others spoke completely different, though distantly related, languages. In terms of their economy, some native peoples fished, while others hunted game and gathered plants. Politically, they organized at the village level, rather than on a regional or larger level. When Europeans arrived, they added to this already existing diversity of languages, economic arrangements, and politics.

Native Peoples in New York

The history of the peopling of New York begins around 5000 b.c.e. Around this time, native peoples of the Paleolithic Age lived in a region that today encompasses New York, New Jersey, Delaware, Pennsylvania, and Connecticut. The cultures of the Iroquois and Algonquins, the two native groups encountered by the Europeans upon their arrival, date to the twelfth century.

Algonquian-speaking peoples lived along the coastal plain and river valley areas of New York. Their origins are uncertain, although archaeologists and ethnographers believe that some Algonquian languages are related to the Muskogean language family of the southeastern United States. Algonquian-speaking peoples were the first to meet Europeans, and many died because of European diseases, as well as in the English and Iroquoian conquest of their lands.

Most Algonquian-speaking peoples lived near bodies of water and survived by fishing and gathering plants. Those who lived in the coastal plain spoke dialects of Algonquian, which made communication among them possible. They built canoes to trade and communicate with other native peoples and also used walking trails to exchange furs, pottery, baskets, and food.

Iroquoian-speaking peoples were the other large Native American population at the time of the Europeans' arrival. They lived in the lower Great Lakes and St. Lawrence Valley regions. Iroquoian-speaking peoples spoke distantly related languages within the Iroquoian language family. Around 1000 c.e., they established settlements along the St. Lawrence River Valley. Mainly, they hunted and gathered plants, but they also raised corn. In the fourteenth century, colder temperatures made it more difficult to grow maize. It also led to a scarcity of good farmland, as well as other natural resources, which, in turn, resulted in competition and frequent wars among the native peoples.

As for their political organization, Iroquoian-speaking peoples were more formally organized than Algonquian-speaking peoples. Iroquoian-speaking peoples organized village councils, which included a representative from each clan in the village. Archaeologists believe that the Five Nations—which included the Seneca, Cayuga, Onondaga, Oneida, and Mohawk—formed an alliance known as the Great League of Peace and Power at some time in the late fifteenth century. (In the early eighteenth century, the Tuscarora, a people from farther south, became the sixth nation to join the alliance.)

The word “peace” in the league’s name referred to the importance of good relations between villagers and with outsiders, while “power” referred to the spiritual strength created by uniting the various villages, clans, and peoples. The Great League’s main body was the Grand Council. Headwomen from each clan chose the fifty male sachems who served on the council. The Grand Council maintained peace but was not a political body with a unified foreign policy or a central government.

After the arrival of the Europeans, the Iroquois quickly became the most powerful group of native peoples. In 1642, the Iroquois began a war with the Huron to the north and west. Since they had access to English firearms, which the Huron did not, they were soon victorious.

By the late seventeenth century, the Five Nations had organized a confederacy to handle their diplomatic and military affairs. This organization formed a permanent alliance with the English under the leadership of Governor-General Sir Edmund Andros, an alliance known as the Covenant Chain, which the two parties agreed to in 1677. Yet, each group interpreted the meaning of the Covenant Chain differently. The Iroquois believed that it recognized Iroquoian autonomy. The English believed that it established their sovereignty over the Iroquois peoples, thus lessening concern that the Iroquois might form an alliance with the French.

Arrival of the Dutch in New York

The Englishman Henry Hudson set sail for the Dutch East India Company in 1609, hoping to find a Northwest Passage to the Orient. Instead, Hudson reached what is today New York, sailing up the river which today bears his name. By 1621, a group of Dutch merchants had formed a national joint-stock company, the Dutch West India Company, whose early economic ventures in New Netherland brought little economic success. Throughout New Netherland’s existence, the threat of English expansion always loomed as the English tried to establish trading posts along the Hudson and Connecticut River Valleys and protested that the entire North American seaboard belonged to them.

In order to make their claim to the Hudson River Valley and its trading opportunities more secure, the Dutch West India Company sent a group of thirty Walloon families, French-speaking exiles from the Southern Netherlands, to settle in New Netherland in 1624. Between 1624 and 1625, a total of 300 colonists from throughout Northern and Western Europe settled in New Netherland, 270 in New Amsterdam, and 30 at Fort Orange (near Albany). The Dutch had trouble attracting immigrants from the Netherlands, since there was no extensive religious persecution or high unemployment there. Many Dutch people also believed that the political rights offered in the colonies were not as favorable as those in the Netherlands.

Around 1626, a labor shortage led to the Dutch West India Company’s decision to buy African slaves in order to guard its livestock, perform farm labor, help load and unload ships, and work on military projects. The company granted slaves “half freedom” after many years. This status enabled slaves to marry, own property, and travel freely throughout the colony. They also could testify in court cases against free whites. In exchange for this status, slaves had to pay the company a yearly sum. By 1664, about 700 of the colony’s nearly 9,000 people were of African descent.

As a result of the limited economic success of the company’s fur-trading ventures, the Dutch government encouraged the establishment of subcolonies—

patroonships—along the Hudson in 1629. Patroons were also granted special fur-trading rights. The patroonships were largely unsuccessful, with the exception of Kiliaen van Rensselaer's Rensselaerswyck.

After 1639, the West India Company officials extended trading privileges to all settlers. A year later, the company offered 200 acres to each colonist who brought five people with him. As a result of these administrative changes, New Netherland's population went from 1,000 to almost 2,000 between 1638 and 1643. Yet the New Netherland settlement was never as attractive to the Dutch as other Dutch settlements in Asia, Brazil, and the West Indies.

Beginning in 1639, relations with native peoples in the area grew tenser. Unfortunately for the Algonquin, the Dutch saw them as obstacles to settlement. The Algonquin also looked upon the Dutch unfavorably because of Dutch zeal to occupy Algonquin lands and the Dutch practice of letting their livestock roam free, often leading to the trampling of the Algonquins' unfenced cornfields. The Dutch were more careful not to antagonize the Iroquois, since they were essential to the fur trade. Rather than negotiate with the Algonquin, Governor-General Kieft decided to go to war with them. By 1645, their superior weapons and alliances with other native peoples helped the Dutch to defeat the Algonquin.

The English Navigation Act of 1651 forbade foreign ships to engage in English trade at sea, an action that the Dutch saw as a direct reference to them. The following year, the first of three English-Dutch wars began. New Netherland did not participate in this first war, which was fought abroad. In 1663, English competition with the Dutch in Africa and their perception that Dutch trading activities in New Netherland violated the 1660 English Navigation Act led to another war between the two countries.

In March 1664, King Charles II gave his brother James, the Duke of York, a land grant in North America that included Long Island and the lands along the Hudson River, on the western side of the Connecticut River, and on the eastern side of Delaware Bay. The residents of New Netherland surrendered to the English, because they did not have the weapons or the food supplies to sustain another war effort. James never visited the colony, and the lack of English defense contributed to the Dutch recapturing it in 1673. After the English mounted an attack in 1674, however, English rule in the colony was permanently established.

English Assume Control of New York

Richard Nicolls, the first English governor of the colony, enforced a group of laws known as the Duke's Laws, initially designed for the Long Island and Westchester settlements. The laws' main components did not allow for an elected assembly or town meetings, but they did mandate religious toleration and kept some Dutch political systems in place.

Meanwhile in Albany, settlers sought to maintain their position in the fur trade. Therefore, they were not as interested as the rest of the colony in antagonizing the French to the north, with whom they traded. Albany residents further resented the privileges granted to New York City merchants, such as a 1678 law that gave these merchants a monopoly over the export trade and a 1684 law that made New York City the single entry port of the colony. Colony officials appeased Albany merchants by granting them a monopoly over the fur trade in 1686.

In 1688, a royal decree by James II made New York part of the new Dominion of New England, whose central headquarters was Boston. When word reached the colony of King James II's overthrow in 1689, the colonists, already anxious because of a rumored French-Native American conspiracy against them and the diminished power of their colony, reacted by rebelling against Lieutenant Governor Nicholson.

After Nicholson fled to England, Jacob Leisler eventually became the commander in chief of the colony. When the English sent a new governor in 1691, Leisler's refusal to immediately step down for the new governor led the Crown to charge him with treason, a charge for which Leisler was executed.

Between 1691 and 1710, English colonists were cautious in their relations with their French counterparts. New Yorkers had chosen not to engage in the English-French wars—King William's War from 1689 to 1697 and Queen Anne's War from 1702 to 1713—because of the colony's poor fortifications and the heavy costs that would be involved. The French, in turn, sent no military expeditions of their own against the English for fear of antagonizing their Iroquois allies. Around 1701, the Iroquois negotiated treaties with the British and French that maintained the Iroquois' neutrality in any British-French conflicts. The British did attempt to send expeditions to fight against the French in Canada in 1709 and 1711, but both expeditions were unsuccessful.

Politically, two factions dominated the colony around the middle of the eighteenth century. In 1709, Lewis Morris organized an interest group consisting primarily of Hudson Valley farmers, New York City artisans, and small traders in Albany and New York City. Morris was able to unite these various interest groups by promising better roads, land laws, and cheap money to farmers; he also offered traders import protection, subsidies for local production, and peddler restrictions. Finally, he agreed to impose more taxes on the wealthy.

Robert Hunter, governor from 1710 to 1720, sided with Morris's faction, granting artisans, shopkeepers, and yeoman farmers special rights, as well as protection to religious dissenters and the Dutch population. In 1720, Adolph Philipse and Peter Schuyler began organizing wealthier merchants in New York City and Albany, large landowners, prominent Anglicans, and poorer freemen. William Burnet, Hunter's successor, also formed a coalition with Morris's group, which led to tense relations with the Philipse-Schuyler group.

Fort Ticonderoga, dating to 1755, commanded a strategically important water route in upstate New York. It was the object of bloody fighting during the French and Indian War and became a vital Northern defense for colonial forces in the American War for Independence. (Library of Congress, HABS, NY, 16-FOTI,1-2)

These two factions came to be referred to as the Court (Philipses) and Country (Morrisites). The Court party was known as a cosmopolitan interest, involved in overseas, intercolonial, and slave trades and in political dealings with native peoples. Conversely, the Morris group was known as provincial and interested in creating a strong intracolony economy. Although other political parties existed, these two were the most influential in their time.

In 1734–1735, colonial politics shifted with the arrest of John Peter Zenger, printer of the *New York Weekly Journal*, a newspaper that Morrisites had recently established. Governor Cosby, political enemy of the Morrisites, had Zenger arrested for libel and the newspaper burned. A jury acquitted Zenger; his landmark case helped establish the idea of a free press and the legitimacy of the public's right to criticize their government officials.

Once the British had defeated the French in the French and Indian War in 1763, white settlers began encroaching even more on Native Americans' lands. In 1768, a meeting between 3,100 native peoples and several intercolonial delegations granted the English most of central and southwestern New York. In turn, the native peoples received goods valued at 10,460 pounds, recognition of tribal lands located within the territorial domain granted by the English, and an agreement that the boundary line separating British from native lands would be respected. The treaty ultimately provided the native peoples little protection, since British government officials could not control the westward expansion of white settlers and speculators.

When the British government decided to impose new imperial policies on its North American colonists in the 1760s, many became incensed at the lack of consideration of their rights. Artisans and mechanics, in particular, began speaking for their own interests instead of relying on elites to do so. Eventually, they formed a group known as the Sons of Liberty, whose goal was to promote a united colonial front against the mother country's harsh policies.

In 1777, after the colonists had won their independence, New York's congress created a constitution that granted common men more rights than had been granted them under the English. Some of the major components of this constitution included abolishing manorial assembly seats, but with an assurance that royally granted lands were still legal; keeping the political system of a governor, lieutenant governor, and bicameral legislature, but allowing the popular election of the executive and upper houses; and lowering the property qualifications to vote in assembly elections.

Throughout the colonial period, the residents of the province of New York constantly experienced social, economic, and political upheavals. For native peoples, the increasing European presence meant a greater loss of land and autonomy, especially after the French were driven from the area. The black slave population in the province was never as large as that in the Southern colonies, yet slaves formed an important part of the province's labor force, especially in New York City. While the Dutch and English were the only European powers to establish governments in the colony, the colony's population came from many other European countries, including France, Germany, Sweden, Scotland, and Ireland. The story of colonial New York, then, is one in which these different groups sought to maintain their distinct cultures as much as they sought to adapt to new cultures, economic opportunities, and political systems.

New York City

Although New York City was a small settlement throughout most of the seventeenth century, by the end of the eighteenth century, it had grown in importance. From a small Dutch trading post that struggled to compete with the English colonies in the early 1600s, over the next 100 years, New York City gradually grew into the economic and political center of a young United States.

The native peoples who lived in the New York City area when the Europeans arrived were the Rechgawawank, known as the Manhate to Europeans. In 1626, Peter Minuit purchased Manhattan Island from the Manhate for 60 guilders in goods, or the equivalent of about 24 dollars (several thousand dollars in today's money).

Arrival of the Dutch

New York City's beginnings date to 1625, when Amsterdam merchants of the Dutch West India Company set up a trading post at the mouth of the Hudson River and named it New Amsterdam. For the first thirty years, the colony was more a trading post than a full-fledged settlement. Company officials ran the colony of New Netherland very strictly, granting few political rights to members of the community. With the arrival of Director-General Peter Stuyvesant in 1647, the colony finally began to take the form of a permanent, organized settlement. In 1653, he granted New Amsterdam settlers the right to form a city government.

Early on, the colony attracted a diverse group of Europeans, from Walloons—French Protestants who first sought exile in the Spanish Netherlands (what is today Belgium)—to Sephardic Jews from Brazil. Few Dutch citizens immigrated to New Amsterdam, because socioeconomic and political conditions were not as desperate in the Netherlands as they were in the countries from which most of the other immigrants came. By the end of the seventeenth century, however, Dutch settlers still outnumbered English and French settlers, although the English and French made up a sizable 40 percent of the colony's population.

Since most European immigrants chose to work for themselves, and the Dutch West India Company needed laborers to work on its behalf, slavery quickly became a part of New Amsterdam's economy. In 1626, the company brought eleven black slaves to the settlement. Black slaves in New York City enjoyed half-freedom: they could marry, own property, and testify against whites in courts. By 1664, blacks—both slave and free—made up about 20 percent of New Amsterdam's population.

Takeover by the English

The English Duke of York assumed power over New Amsterdam and the colony of New Netherland in 1664, renaming the colony New York. During the first thirty years of English rule, New York City entered a new phase of development, marking the end of a strong Dutch influence. Although Dutch merchants managed to retain power over the settlement's economic affairs in 1677, English and French merchants were in control of New York's economic affairs by 1703. Some Dutchmen still retained their positions of wealth during the early English period; however, Dutch people of the middling rank saw their opportunities for socioeconomic advancement quashed.

While the French began arriving in large number in the 1680s and had established a cultural base by founding the Église Française à la Nouvelle York in 1688, English immigration in the 1680s had slowed. The English did not form a church of their own until 1697, when they established Anglican Trinity Church (although another English group, the Quakers, had organized a small number of meetings by this time). It took longer for the English to form a culturally cohesive group because of strife between Crown officials and English settlers in the colony. In addition, unlike the Dutch and French populations, the English population included a greater variety of religious groups.

The years 1689 to 1691 mark a significant turning point in the history of New York City. After the fall of Charles II in the Glorious Revolution of 1688, Jacob Leisler assumed power in the city, primarily representing a group of Dutch residents. In many ways, the rebellion of New York City residents was a response to the loss of Dutch power after the English takeover of New Amsterdam.

Leisler was able to gain the support of many of these Dutch by promising that William of Orange's ascension to the English throne would force the English to give up New York. Leisler, however, was removed from power in 1691 by the new monarchs, William and Mary. This event marked the defeat of New York's Dutch and reflected the final loss of strong Dutch political influence in the colony.

Slavery and Race

In the early eighteenth century, under the British, the slave trade boomed. Male slaves composed 15 percent of the manual labor force and 20 percent of New York City's population in 1703. Free blacks tended to live on farms north of the city's center, and black slaves typically served as domestic servants in white households.

Significantly, the slave trade expanded even after slave revolts in 1712 and 1741. The 1712 revolt—in which some twenty slaves killed nine white people—led to the creation of stricter slave laws, severely curtailing slaves' rights. In 1741, white New Yorkers blamed black slaves for a number of fires and robberies and came to believe that slaves were planning a huge conspiracy. As a result, almost 100 slaves were tortured, hung, burned, or resold into slavery in the West Indies.

In contrast to the fewer rights given black slaves under English rule, members of minority religions were given more rights. The English allowed Lutherans, Quakers, and Jews to hold services, a right not granted them under the Dutch. By 1695, all of these groups were worshipping in their own churches.

Under the rule of Lord Cornbury in the early years of the eighteenth century, the British worked toward assimilating the Dutch and French to the English language and the Anglican religion. Besides schools, Cornbury turned to the Anglican Society for the Propagation of the Gospel in Foreign Parts to promote his assimilationist policy. Since, from 1702 to 1726, the Dutch Reformed Church was not allowed to offer classes to Dutch children, the Dutch heritage lost much of its influence. By the middle of the eighteenth century, most Dutch people spoke English as their first language.

This 1767 map of New York City, by British Army surveyor Bernard Ratzen, is believed to be the most accurate of the pre-Revolutionary War period. Open land was still plentiful in lower Manhattan. (Brown Brothers, Sterling, Pennsylvania)

As for the French Huguenots, by 1720 they had suffered a severe rift within their church, and, by 1730, many had left the church. This contributed to their assimilation into English culture, as did their tendency to marry outside their group. As for the British population, the early eighteenth century saw the rise of the Presbyterian and Baptist Churches. The Anglican Church grew, too, taking in many of the French Huguenot population and some of the Dutch.

Political rule in New York City became more fractious in the 1730s. During this period, a common form of political protest was the publishing of political pamphlets. In 1735, the rights of the publishers of these pamphlets came into question when printer John Peter Zenger was arrested for libel; he was later acquitted in a landmark case for freedom of the press. Political leaders during this period also began appealing to the large group of artisans in the city. In the elections of 1733 and 1734, artisans were able to elect many of their own to city office. This era, then, demonstrated a greater level of political participation among the white male population and established the idea of a government's power being vested in the people.

In 1765, New York City was in a precarious state. Not only had British imports decreased, but grain prices had skyrocketed and land prices had taken a dip. Thus, when the British government passed the Stamp Act that same year, the first tax ever on the American colonies, New York's residents reacted by opposing this act and subsequent English measures. This opposition served to unify many of the American colonists, as the English suddenly began imposing what the colonists viewed as unfair and restrictive policies.

Whether under Dutch or English rule, New York City was important to the Dutch and English empires in the North American mainland. For many Europeans who came to settle there, it represented the most tolerant community in the seventeenth century and a place to seek economic opportunities in the eighteenth century. For the Africans who lived in New York City, both slave and free, opportunities decreased with time; they had enjoyed greater liberties in the seventeenth century under Dutch rule than they did in the eighteenth century under the British.

Newfoundland

In the sixteenth century, England's first North American possession, the island of Newfoundland, marked the northwestern edge of the known world to Europeans. Its Grand Banks was one of the world's richest breeding grounds for codfish, and it became the site of an international fishery. Settlement of the island began in the early seventeenth century, initiating a lengthy dispute among English fishing interests. The fishery also fueled English-French imperial rivalry over the island. By the early eighteenth century, England had assumed sole possession of Newfoundland.

Within a decade of Giovanni Caboto's (John Cabot's) voyage to Newfoundland in 1497, fishing vessels from Spain, Portugal, and France conducted a migratory fishery in its waters. Between 1530 and 1600, the Basques operated cod, seal, and whale fisheries off Newfoundland and Labrador. Although Europeans did not settle the island, some erected temporary structures and encountered the island's native inhabitants. The Beothuk, an Algonquian-speaking people numbering between 500 and 700, lived by hunting, gathering, and fishing. Over the colonial period, as meetings with Europeans became more frequent and hostile, the Beothuks gradually withdrew to the interior.

In 1583, Sir Humphrey Gilbert claimed Newfoundland for Queen Elizabeth I. By the early seventeenth century, the Iberian fisheries declined and were superseded by those of the English and the French. The English practiced a "dry fishery" (as opposed to the European "green" or "wet" fishery whereby ships returned directly to Europe from the fishing grounds with a heavily salted catch), which required the presence of shore stations to lightly salt and sun-dry the catch prior to returning home. Attention turned to year-round settlement of the island, which prompted a bitter and long-standing debate in England between the West Country migratory (or ship) fishing interest and the resident fishing interest.

English policy toward settlement in Newfoundland was noncommittal for much of the colonial period, and although the resident fishery was not officially encouraged, the English government realized that some settlement was necessary to protect its claim over the island. Several officially sponsored attempts at colonization occurred in the first half of the seventeenth century, the first one being John Guy's colony at Cuper's Cove (Cupids) in 1610. Others followed, including George Calvert's (Lord Baltimore) colony of Avalon between 1619 and 1625. Frustrated by the colony's lack of progress, Lord Baltimore abandoned the settlement and founded a new colony in Maryland. The most successful of the colonies was David Kirke's Ferryland, which functioned between 1638 and 1652. Although these all failed to become self-sufficient and profitable for their investors and officially came to an end, many settlers remained. By 1670, English settlement on the island was firmly established.

Competition from France

England's main competition in Newfoundland was France. In 1662, France established a settlement at Plaisance (Placentia) on the southwest coast of the Avalon Peninsula to conduct a dry fishery. Its strategic location between New France and Europe made it a useful supply base and port for French naval and merchant vessels. The imperial contest to control the valuable fishery led to several conflicts in Newfoundland, especially during King William's and Queen Anne's Wars. France relinquished its claim to Newfoundland in 1713, though the French continued to enjoy fishing rights between Cape Bonavista and Pointe Riche. These rights were later confirmed by the Treaty of Paris in 1763, which also ceded to France the south coast islands of St. Pierre and Miquelon.

By the early eighteenth century, the island was increasingly visited by trading vessels from Ireland and New England. Ireland was the main provider of victuals to Newfoundland after 1650, though during wartime and by midcentury, the "coasters" from New England largely assumed this function. Although the New Englanders were criticized for spiriting away fishermen from the island, settlement increased and expanded along the south and west coasts of the island as Newfoundland received an influx of Irish laborers after 1720.

Increased trade, population growth, and ensuing tensions between English Protestants and Irish Catholics encouraged Britain to create civil institutions in Newfoundland. In 1729, Henry Osborne, a naval commodore, was appointed the island's first governor and commander-in-chief. Possessing full civil and military authority, he divided the island into six districts and appointed justices of the peace and constables. In 1730, a jail and a courthouse were built in St. John's, making the town the official judicial center of the island. Missionaries from the Church of England opened schools, and the island's economy diversified to include sealing, furring, and salmon fishing. The migratory interest gradually supported settlement, as West Country merchants became concentrated on the island and operated importation and supply businesses.

The island experienced a period of prosperity between 1763 and 1775, as it was fully brought into the British trading system. A customs house was built in 1766, indicative of Newfoundland's position at the apex of a triangular trade between New England and the West Indies. Despite initial hardships in

1775, the American Revolution ultimately assisted Newfoundland's development. In the absence of New England traders, Newfoundland merchants looked to Bermuda and Canada for supplies and sent their own vessels to the West Indies. The drain of settlers to New England ended and the resident population was further encouraged by the war's lengthy disruption of the migratory fishery. However, growing numbers of British and Miqmaq settlers and increased exploitation of resources had a devastating effect on the island's remaining Beothuk, who ceased to exist as a people by 1829.

Between 1750 and 1790, Newfoundland's permanent population more than doubled, from 7,000 to close to 17,000. By the close of the eighteenth century, Newfoundland had received a new constitution, its first chief justice, and a supreme court. The economic and strategic value of the island's fisheries and trade continued to invite settlers and traders from all over the Atlantic world.

Newport

Newport, Rhode Island, was one of British North America's largest cities before the War for Independence.

Long before the English town was founded in 1639, the island of Aquidneck was home to the Narragansett and Wampanoag peoples, who seemed to have fought over it regularly. Giovanni da Verrazano, sailing for France, spent a couple of weeks there in 1524 and praised the location, but no immediate European settlement followed. In the 1630s, while New England was in the throes of its Antinomian Controversy, William Coddington led a group of refugees from Massachusetts Bay to the mouth of Narragansett Bay and there founded Newport.

Early Newport society, like early New England society in general, was fairly stratified, and Coddington, a failed merchant with pretensions to the gentry class, envisioned himself at the top. Merchants and artisans were drawn to the economic opportunities provided by the harbor, and the way the land was divided gave the middling class decent-sized farms and the gentry massive estates that they rented out to tenants. Although Newport was founded by a small, tightly knit group of outcasts from the larger Bay Colony, there were Baptists, Quakers (George Fox, the founder of Quakerism, visited Newport in 1672), and, later, a small Jewish population living alongside the Puritans. Importantly, and unlike the Massachusetts Bay Colony, Newport's civil and religious institutions were almost completely separate, and a remarkable tolerance for various sects existed. Not surprisingly, Massachusetts Bay residents looked down on Rhode Island—sometimes referring to it as Rogue's Island—as a backward and sinful place.

Newport grew rapidly and became something of a commercial center during the eighteenth century. Merchants operating out of Newport were plugged into the Atlantic world through their connections to Boston, London, Holland, West Africa, Charles Town, and the West Indies. They oversaw a profitable trade in rum, lumber, provisions, and livestock, and they imported sugar, flour, molasses, and other food products as well as cloth and other supplies. In 1731, Governor Joseph Jencks reported to the board of trade that Newport had approximately 4,640 residents living in 400 houses. The merchant fleet boasted between seventy-five and eighty-five boats. Newport's population continued to grow in terms of population and importance to Atlantic trade, and by the time of the War for Independence, it was among the largest cities in British North America.

Some time in the early eighteenth century—the precise date is unclear—Newport began to trade directly with West African nations for slaves. Typically, though not always, slaves from West Africa would be taken to the West Indies, and molasses from the West Indies would be taken to Newport and used in the production of rum. Interestingly, two outspoken opponents of slavery, Ezra Stiles and Samuel Hopkins—the former a future president of Yale and the latter one of Jonathan Edwards's brightest students—both preached in Newport during the colonial era. Newport's fortunes were tied to Atlantic trade, including the slave trade, yet it also produced eloquent attacks on that trade.

In the middle of the eighteenth century, Newport's trade suffered as a result of international conflict. The Seven Years' War hurt Newport particularly—though it benefited smugglers and privateers at first, since its merchants had previously operated in both the British and French West Indies. New taxes in the 1760s made it difficult and unprofitable to trade with the French; therefore there was considerable support for independence in Newport.

With George Washington's Continental army otherwise occupied, the British under Clinton took Newport without a fight in December 1776. Occasionally, state militias from New England would attack British forces with little effect. In the summer of 1778, a larger national army and a French naval squadron attacked Newport, but bad weather prevented them from taking it. In 1779, the British left, deciding to concentrate on the war in the South. The French under Rochambeau arrived the next summer, effectively ensuring that Newport would not fall back into British hands.

Newport remained an important commercial center in the nineteenth century, though it never fully escaped the shadow cast by Boston and other towns in the region, such as New York, which grew much more rapidly.

Newspapers and Journals

During the eighteenth century, British North America witnessed the rise of a new form of print that was to radically alter the way information was disseminated to society. Printing presses had already been established throughout several of the colonies, and, by 1700, six printers had set up shop throughout several colonial cities.

Before the eighteenth century, printers focused on publishing religious, theological, and, to a lesser extent, political, legal, and educational materials in the form of books and almanacs. New periodical forms, however, had developed in Restoration England, and these soon proved influential in America.

The *London Gazette* was a weekly publication that gained an extensive readership throughout England by the end of the seventeenth century. In 1690, a Boston printer named Benjamin Harris published America's first attempt at this kind of a newspaper, entitled *Publick Occurrences*. The newspaper was immediately suppressed by the government of Massachusetts for publishing information considered too critical of the government.

The first newsheet in America, called Publick Occurrences, was published in Boston on September 25, 1690. Intended as a monthly, the publication was suppressed by the colonial government and never appeared again. (Brown Brothers, Sterling, Pennsylvania)

The desire for a weekly publication remained strong, and in 1704, John Campbell, another Boston printer, began publishing the *Boston News-Letter*, which lasted for nineteen years. Soon after, other printers began publishing newspapers in the major urban centers across the colonies, and, by 1750, a total of twelve newspapers had been established.

Newspapers treated their readers to a multitude of different topics. The major focus of most eighteenth-century newspapers was political and diplomatic news. Printers published an extensive amount of material about European affairs, since wars, diplomatic intrigues, and political debates seemed to be of primary interest to readers. By the second half of the eighteenth century, however, other types of information competed for space.

An increase in economic activity made newspapers quite valuable to shopkeepers and merchants, who advertised their wares and services to a growing consumer public. Printers encouraged this advertising, since they found it to be a lucrative supplement to their earnings. Religious material in the form of debates, devotional and promotional literature, and advertisements offered opportunities to those in search of spiritual enrichment. While the subject matter was diverse, the limited space provided by newspapers of the time prevented any extended analysis of one particular subject. Most newspapers normally consisted of four pages per issue, with two to four columns on each.

As newspapers proliferated in the colonies, another influence from England contributed to the rise of a second type of periodical. The *Gentleman's Magazine*, first published in London in 1731, offered readers a more comprehensive array of literary articles that allowed authors to go into greater depth than they could in newspapers. Magazines were lengthy by comparison, with the number of pages per issue ranging on average from ten to fifty. Many of the articles published in magazines reflected the growing influence of Enlightenment thinking, where rational thought spilled over into political, scientific, economic, and religious essays. Convinced that there was a similar demand for magazines in America, several printers attempted to meet this need. In February 1741, Andrew Bradford and Benjamin Franklin, both printers from Philadelphia, respectively published the first two magazines in America within three days of one another: Bradford's *American Magazine, or A Monthly View of the Political State of the British Colonies*, and Franklin's *General Magazine, and Historical Chronicle, for All the British Plantations in America*.

Although printers compiled the material for newspapers and magazines, they depended heavily on outside resources. Many printers subscribed to other periodicals and had no compunction in borrowing articles and information generously from their competitor's pages. European periodicals in particular became an important source of verbiage for American periodicals, as the desire for European material remained strong in the United States through the end of the eighteenth century. Printers also published personal letters, many of which were deliberately written for public display. Local authors provided printers with a vast array of material, most of which was printed, since many of these authors were also the subscribers and financial supporters of these same periodicals.

The rise in the overall numbers of periodicals throughout the eighteenth century attests to their increasing popularity. Tables 1 (above) and 2 (below) illustrate the growth of periodicals during this era. In the year 1700, not a single newspaper or magazine had been published in North America. By the end of the century, that changed dramatically, with over 200 periodicals circulating throughout the various states. This rapidly growing industry was responding to a surge in reader demand. According to one estimate, approximately 15 percent of all adult white males subscribed to some form of periodical by the end of the century, creating a higher per capita readership of periodicals than anywhere else in the Atlantic world. The normal circulation size of periodicals ranged from the low hundreds to just over a thousand.

Printers faced an arduous journey in publishing a periodical. Once publication of the periodical began, the distribution process suffered trials and tribulations at several levels. Readers often complained about lateness in the arrival of their periodicals. In turn, printers lamented over their inability to collect the money owed to them by subscribers. Additional factors contributed to the interruptions of regular delivery, including problems with paper supply, poor weather conditions, and labor shortages. The failure rate of many periodicals, in particular magazines, attests to the inability of many printers to overcome these numerous obstacles. Most magazines published in the eighteenth century, for example, never made it past their first year of publication.

Table 2. Growth of the Magazine Industry over the Eighteenth Century

Year	Number of Magazines
1700	0

1800	14

Regardless of the poor success of periodical publishing, many printers still tried to make a go of it. Printers worked hard at meeting the demands of their readers by appealing to the eye, offering diverse subject matter, and trying to control publication costs. To boost their sales, printers offered incentives, including bulk sales at a discounted price, or reduced rates for those who agreed to subscribe long-term. Since collecting subscription payments was unpredictable, they tried other things to supplement their income. Advertisements became essential to a periodical's survival, particularly newspapers, and by the end of the eighteenth century, it had become an integral part of such publications.

A periodical's success also depended on it being affordable to as many people as possible. Prices varied, but generally periodicals cost between 15 and 20 shillings a year to subscribe. This price proved costly for the common person, so most subscribers were among the wealthy.

Although subscribers tended to belong to the upper ranks of society, printers still hoped that people of more modest means would have access to periodicals. Literacy rates in New England were fairly high, with almost universal literacy for white males by the end of the eighteenth century. The rates for white males in the South were slightly lower, with about two-thirds literate by the end of the century. Although literacy among females was lower than that of men, rates were still high compared to those in other nations, with some 60 percent of women in New England being literate and about 30 percent of those in the South.

For those who did not subscribe, there were various ways of gaining access to magazines and newspapers. One was through circulating libraries, where periodicals became an important part of their holdings. Taverns and coffeehouses also provided free access to periodical literature, as innkeepers subscribed to newspapers and magazines in an effort to draw in customers. Also, people often came across periodicals through personal relationships, as many shared their copies of newspapers and magazines.

Most printers also tried to branch out beyond the cities in order to expand their readership. Overall, successful printers were the ones who marketed their periodicals in any way possible to ensure an adequate number of readers.

Newspapers and magazines had become a vital form of communication by the end of the eighteenth century. As American society matured, periodicals filled a growing need for information, with newspapers providing more of the political and economic content and magazines the cultural, religious, and literary material. For those who could not afford to buy books or other expensive printed items, periodicals offered greater access to information than ever before. The words of one author from the *The Philadelphia Monthly Magazine* (January 1798) rang true to many: "among all the modes [of communication] that have been devised for that purpose, no one has been so effectual as that of periodical performances."

North, Lord (1732–1792)

Although actually the Second Earl of Guilford by inheritance, Sir Frederick North was best known by the courtesy title of Lord North. The honorary title was given to North when he became prime minister, and he used it until his father's death in 1790.

Born April 13, 1732, North attended Eton and Oxford, an education that provided him with good social and political contacts, who proved helpful to him when he entered Parliament at the age of 22. As the representative for the town of Banbury, North remained in Parliament for nearly forty years. The Duke of Newcastle made him lord of the treasury in 1759, a position he held under both John Stuart Bute and George Greenville until 1765.

North was a natural politician who rose through the government, first entering the Privy Council and becoming paymaster general in 1766, then being made chancellor of the exchequer in 1767. He became prime minister in March 1770, a post he held for the next twelve years. This was a time of unprecedented turmoil for the British Empire, and North had few friends by the time his ministerial position ended.

Although a man of notable intelligence and undeniable ability, North, while prime minister, allowed himself to be placed into the unenviable position of pawn between king, Parliament, and the colonies. Private letters between North and the king reveal that there was the intimacy and confidentiality of friendship between them, which possibly explains the compliance of North. As minister, North was in a difficult position. It was his task to defend measures he neither created nor approved. This required him to engage in debates in the House of Commons with some of the ablest orators of the period, particularly Charles J. Fox and Edmund Burke, with little or no support except from a few champions of the Crown, who were paid for their help.

While North's time as prime minister lasted twelve years, the American Revolution was certainly the most important event during his service, and he was one of the main participants in the action. In the past, critics and some historians have wrongfully charged North with pushing the colonies toward independence, but this is not entirely the case. In nearly every circumstance where North presided over legislative activities placing him at odds with the colonies, he was following the orders of the Crown. Nevertheless, North's first act as head of the government was the retention of the tea duties. Later, in 1774, North introduced the Boston Port Bill.

After the war erupted, North counseled the king to sue for peace and reconciliation with the colonies. North might have succeeded, but outside forces swayed the king. Of questionable mental stability, the king was persuaded by his advisers that it would be better to wage war—even though, by 1779, many considered it impossible to win—than to let another Whig-dominated government come to power. Having heard about the surrender of Cornwallis at Yorktown, North resigned from his position as prime minister in March 1782.

Sir Frederick North, commonly known as Lord North, served as British prime minister from 1770 to 1782 and is remembered for his role in losing the American colonies. He resigned after the British surrender at Yorktown. (San Diego Museum of Art, San Diego, California/Bridgeman Art Library)

Lord North re-entered politics in April 1783, when he formed a coalition with his former political opponent Charles J. Fox. North and Fox shared the position of secretary of state under the premiership of the duke of Portland, but the coalition ministry collapsed in December 1783, when Fox's East India bill was rejected by Parliament.

Suffering from failing eyesight, North dropped entirely out of public life. Although completely blind by 1789, he made a final political appearance in Parliament to offer his support to the Regency bill. He died in London on August 5, 1792.

North Carolina

In 1524, Giovanni da Verrazano, a Florentine captain in French employ, first explored the North Carolina coast near Cape Fear, writing descriptive journals of the unexplored lands. Sir Walter Raleigh financed several unsuccessful expeditions between 1584 and 1590 to settle the Roanoke Colony, on the Outer Banks, in the name of England. Yet North Carolina would receive its first permanent European settlers from the Virginia colony, established first at Jamestown in 1607. The settlers moved south into the Currituck and Albemarle Sound regions in the mid-seventeenth century.

In 1663, King Charles II granted Carolina land to eight noblemen proprietors. These men had survived the civil wars with their property intact; they generally supported the king and were rewarded by an appreciative Charles II. North and South Carolina became separate colonies in 1691. Factions and squabbles developed between the proprietary forces and the antiproprietary residents and became so divisive that, in 1729, both colonies abandoned their proprietary claims and became royal colonies.

Unlike its neighbor to the south, which grew wealthy raising rice and importing slaves, North Carolina grew slowly and modestly. Most of the residents were subsistence farmers, living on dispersed farms and raising moderate amounts of tobacco, corn, cattle, and swine. The most profitable products in colonial North Carolina were naval stores (tar, pitch, and turpentine) and lumber. Only a very few wealthy planters lived along the rivers near the coast.

Although the tempestuous Outer Banks along North Carolina's coastline and the lack of natural harbors prohibited much sea travel, early port cities such as Bath and New Bern were established in the late seventeenth and early eighteenth centuries. The myriad coves and stormy waters served as havens for pirates, most famously Blackbeard, who eventually died at the hands of the British navy in Pamlico Sound in 1718.

Early colonial expansion beyond the coast led to a conflict, known as the Tuscarora War, with the native Tuscarora between 1711 and 1715. The Tuscarora and various other tribes had lived along the coast of North Carolina before being challenged by the encroaching Europeans. Their defeat in the war led them to move to New York. European settlers would encounter other proud tribes, such as the Cherokee and Catawba, in the Piedmont and mountainous regions of the colony to the west.

Although most of the early settlers were English, several came from other parts of Europe. Christopher von Graffenreid settled the town of New Bern with many Swiss and German Palatine immigrants in 1710. Highlanders fleeing unrest and economic crisis in Scotland settled along the Cape Fear River in the middle decades of the eighteenth century. Beginning in the 1730s, Scots-Irish and German immigrants began coming down the frontier trails all the way from Philadelphia and settled along the North Carolina frontier, in the plains of the western Piedmont and mountains and valleys of the Appalachians. North Carolina also became a haven for unique religious sects, as Quakers settled along the Eastern seaboard and Moravians clustered in the Piedmont.

In the years leading up to the Revolution, economic and social differences between the settlers in the western regions and the predominantly English settlers in the east led to conflict. The centralized system of government favored the eastern aristocrats and prompted western outrage at what they deemed unfair taxes, fees, and lack of judicial redress. Calling themselves Regulators, several disgruntled farmers marched east to demand their rights. After years of threats and conflict, Governor William Tryon crushed a Regulator army on May 14, 1771, at Alamance Creek, near Hillsborough, effectively ending the movement.

When Parliament passed the Stamp Act in 1765, North Carolina's Sons of Liberty, led by Cornelius Harnett, instigated protests and forced the governor to refuse the stamps. North Carolina patriots continued to be active in protests in the early 1770s, often coming into conflict with Josiah Martin, the new royal governor; in 1775, they forced Martin to take refuge aboard a British warship. As the Revolutionary War began, 3,000 loyalist Scottish Highlanders rallied and marched from Cross Creek (modern Fayetteville) toward Wilmington to rendezvous with a British army en route by sea. Patriot militia routed them at the Battle of Moore's Creek Bridge on February 27, 1776. British leaders abandoned their plans to defeat the Southern colonies for several years. On March 15, 1781, the Redcoat army of Lord Cornwallis fought to a bloody draw with a colonial army under General Nathaniel Green at Guilford Court House. This battle and subsequent lack of supplies and support forced Cornwallis to abandon North Carolina and move to Yorktown, Virginia, where he would be forced to surrender his army.

After the war, North Carolina's independent-minded population vigorously debated the Constitution and initially rejected it, fearing a strong central government. But after the promise of a Bill of Rights, the state finally joined the new nation by ratifying the Constitution on November 21, 1789—becoming the twelfth state to do so.

Northwest Passage

Although the idea of a Northwest Passage—a sea route cutting through the American continent to Asia—may seem absurd today, this dream arose and remained a propelling force for many years, justifying continued exploration by Spain, France, and England. The backbone of the search for a Northwest Passage was the desire to open lucrative trade with China. A number of explorers searched for the passage—some finding only disaster or death. While the passage was never found, their search produced several side effects.

Sixteenth-century colonial America was dominated by Spain. With the explorations of Christopher Columbus, who sailed under the Spanish flag,

Spaniards initiated the exchange between America and the Old World that continues to this day.

In 1497, King Henry VII, more than ten years after dismissing Columbus's request for money, chose John Cabot to look for a passage to the Indies across the North Atlantic. Cabot managed to reach the tip of Newfoundland. Believing he had found Asia, he excitedly rushed back to England to gather a small follow-up fleet with which to continue his explorations. In 1498, hurrying headlong toward disaster, he disappeared and was not heard from again.

The English mariner Sir Martin Frobisher was one of a number of explorers who became convinced of the existence of a Northwest Passage, secured the financial backing to find it, and failed to do so. He made three attempts in the 1570s. (Photo by Archive Photos/Getty Images)

Meanwhile, about 3,000 miles to the south, Columbus reached the shore of mainland Venezuela. In less than a year, another Spanish expedition landed about 600 miles farther south—a feat found to be so significant that it prompted the Portuguese to send Amerigo Vespucci to carry out additional investigations.

The rise of cartography in the sixteenth century caused some to speculate that several large masses of land were scattered in the western Atlantic. Speculation among cartographers was that these masses were connected to each other but not to Asia. The searchers for the Northwest Passage were apparently undaunted by geographical facts that were rapidly becoming apparent. The focus, but not the search, was altered as the question arose as to how much water existed between this large land mass named America (in honor of Amerigo Vespucci) and Asia.

In 1519, this question prompted King Charles I of Spain to finance Ferdinand Magellan's expedition to circumnavigate the globe. With several starts and stops along the way, the travelers finally arrived at the Pacific Ocean in late November 1520. After a journey of almost four months across the Pacific, Magellan reached the Philippines, where native tribesmen killed him. What was left of the expedition managed to continue into the Indian Ocean; in 1522, the remaining explorers made it back to Spain with a boatload of spices.

Looking at what was gained and lost, Magellan's expedition appears to have been a disaster. It started out with five ships and 250 men, only to limp back with one ship and 18 men. The geographic information gained and brought back by the survivors, however, was invaluable. There was no longer any doubt that America was a continent unto itself and that it was separated from Asia by an unfathomably enormous body of water—the Pacific Ocean.

In 1524, France sent Giovanni da Verrazano on a scouting expedition to the New World. His mission was to explore the Atlantic coast from North Carolina to Canada and ferret out the ever-elusive Northwest Passage. Verrazano returned unsuccessful from his mission. Eleven years later, France probed farther north. Jacques Cartier voyaged up the St. Lawrence River, but his luck was no better.

England did not intend to be left behind in the exploration race, though it entered it a bit late, in the sixteenth century under Spain's shadow. As early as the mid-1500s, Martin Frobisher got Queen Elizabeth I's attention. Frobisher's ease at performing slaving voyages to West Africa, privateering raids in the Atlantic, and fighting forays in Ireland was enough for the queen to become interested in sponsoring his explorations. So much so that, in 1576, he sailed on yet another search for a Northwest Passage to Asia, an all-expense-paid trip funded by Elizabeth I herself.

Frobisher sailed north of Labrador and returned to England with an Eskimo (complete with kayak) and a massive stone that was easily mistaken for gold ore. The queen, thrilled, gave him money for two more voyages in 1577 and 1578, from which he managed to haul back close to 2,000 tons of this unique black rock. Poor Frobisher was not able to maintain his prestige when, on closer inspection, the minerals he had brought home turned out to be "fool's gold." He thus became the fool, his reputation ruined.

In the early 1600s, the English navigator Henry Hudson, sailing for the Dutch, also sought the elusive Northwest Passage, searching the bay and the river that currently bear his name. In 1611, his starving and frustrated crew mutinied and left Hudson, his son, and seven crew members in an open boat; none of them was ever heard from again.

In the 1630s, English explorers Luke Fox and Thomas James also explored Hudson Bay in a vain attempt to find the passage. The last major effort during the colonial era was led by British explorer Samuel Hearne in the early 1770s.

The search for the Northwest Passage never bore fruit, and the explorations finally ended. What came in their place was the realization that there were riches to be found in America, and the shift from exploration to colonization began in earnest. Spain, France, England, and others began the race to settle the New World.

Several major attempts to find a passage to the west were again made by various European countries in the nineteenth century. The first success came in the early twentieth century, with the 1903–1906 expedition of Norwegian explorer Roald Amundsen, the first man to reach the South Pole.

Of Plymouth Plantation

Of Plymouth Plantation stands as one of the most famous and important journal histories produced during the colonial period. Its author, William Bradford, was a separatist who journeyed with his congregation from the village of Scrooby, England, first to the Netherlands and then to America (in the famous *Mayflower* pilgrimage). After the death of the Plymouth colony's first governor in 1621, Bradford was elected governor and remained the dominant political personage in the colony until his death in 1657.

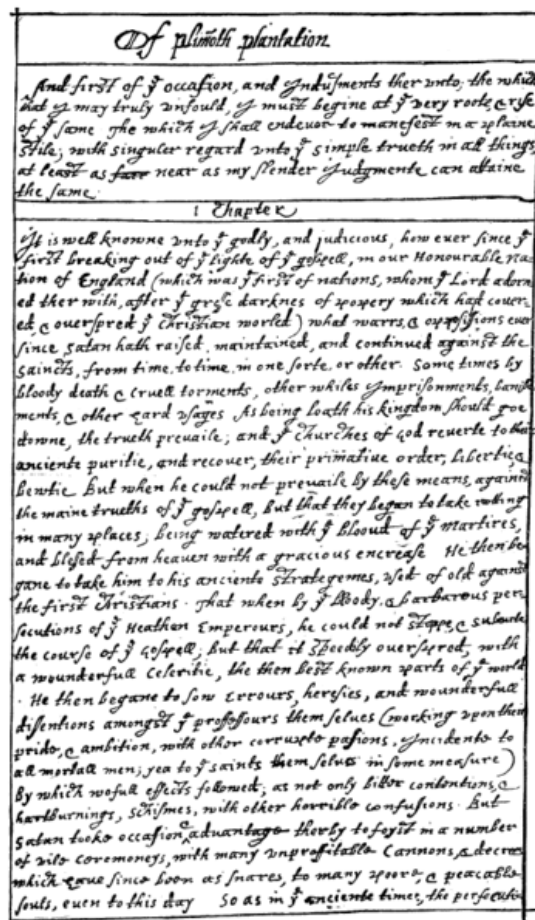

Although clearly intended as a history, the journal was not published during the colonial period. Instead, the manuscript passed down through Bradford's heirs and eventually was deposited in Thomas Prince's library in the eighteenth century. Cotton Mather, Nathaniel Morton, and Thomas Hutchinson all used the journal as a source for their own histories of New England. After vanishing during the American Revolution, the journal reappeared in the John Williams Library in London; it was finally returned and deposited in the Massachusetts State House in 1897. The historian Samuel Eliot Morison was able thereby to publish the first complete transcription from the original manuscript in 1952, which remains the definitive edition to this day.

Bradford wrote within traditional English Protestant historiography. This approach drew heavily on John Foxe's *Book of Martyrs* and saw history in millennial terms. The Protestant Reformation, accordingly, constituted the restoration of the true church away from the control of the Pope (who was identified as the Biblical Antichrist). In this context, England served as a bulwark of Protestantism. Bradford, therefore, began his narrative with the revival of the church from "Anti-Christian apostasy" under the Church of Rome and continued through the Marian Martyrs and the restoration of Protestantism under Queen Elizabeth I. As a Puritan, however, Bradford believed that the Elizabethan church remained only half reformed, and he explained how this resulted in the rise of Puritanism. The persecution of the Puritans led some of them to the conclusion that the Church of England was hopelessly corrupt and that separation from it was therefore required. At this point, the story narrows to Bradford's church, and God's providence (understood earlier in the grand sweep of world events) became merely an interpretive tool for individual blessings and misfortunes. Indeed, Bradford exhibited little sense of a special divine mission or place within Christian history for the Plymouth colony.

The narrative moves swiftly through the escape of the Scrooby congregation to the Netherlands and the subsequent discussion of plans to relocate to America. Here, the second theme of Bradford's history entered: the colony's financial difficulties with the London adventurers (investors) who provided the capital for the expedition. As the colonists sat shivering and starving on the coast of Massachusetts, the company began to wonder aloud why the settlers were not sending back any marketable commodities. In addition, the original plan for the colony had been that everyone would work toward a common stock, which would then be divided up among the stockholders after seven years. Thus provisions were also grown and distributed communally. Desperate to increase food production, in 1623, Bradford dispensed land to individual householders to work for their own subsistence, which appears to have solved

the problem.

A third major theme was the colony's relationships with the various Native American groups. The first hesitant encounters with the native peoples occurred while the Pilgrims were still scouting the coast. Upon settlement, two English-speaking natives, Samoset and Squanto, appeared and used their linguistic skills to become middlemen. They produced generally pacific relations for the colony, an alliance with the chief Massasoit, and access to the economically crucial beaver trade.

William Bradford's *Of Plymouth Plantation*, a journal of the colony from the Pilgrims' landing in 1620 to his death in 1657, is one of the most important historical and literary works of the colonial era. (© North Wind Picture Archives)

As Plymouth became allied with certain Native American groups, the colony found itself drawn into inter-tribal rivalries. At the same time, Plymouth joined an alliance of the other New England colonies after 1630. This alliance coordinated military action during the Pequot War (a war they fought alongside the Narragansett in 1637–1638) and subsequent diplomatic action during a period of rising hostility toward the Narragansett, which was itself born out of hostilities between the Narragansett and (then Plymouth allies) the Mohegan.

By the end of the journal, a degree of pessimism had crept into Bradford's tone. Profane and scandalous individuals (especially servants) seemed to abound. Most famously, Bradford recounted the discovery, conviction, and execution of a young man for bestiality, an event that capped a correspondence between Plymouth and the ministers of Massachusetts concerning the increasing instances of sexual transgression.

Almost as if reflecting this despair, the manuscript ends abruptly, with visit of an English privateer to Massachusetts in 1646. Immediately following the end of the narrative is a passenger manifest for the *Mayflower*. Thus the story comes almost full circle.

Oglethorpe, James (1696–1785)

Born on December 22, 1696, into a wealthy and prominent family, James Edward Oglethorpe became a noted eighteenth-century politician, soldier, colonizer, and social reformer. As a teenager, he was lured by the prospect of military service and the potential for glory and advancement that it offered. He joined the army of the Holy Roman Empire in its fight against the Turks and, as an aide-de-camp to Prince Eugene of Savoy, participated in the successful siege of Belgrade in 1717.

After proving himself on the battlefield, Oglethorpe returned to England and embarked on his political career. In 1722, he was selected to the English House of Commons from the borough of Haslemere. He would hold this seat continuously for the next three decades.

In Parliament, the young Oglethorpe cast his social and political nets widely. He championed the cause of impressed sailors and led a celebrated investigation into debtor prisons. Oglethorpe also invested money in the Royal African Company, but within a few years of this financial move he reversed himself and became an ardent opponent of slavery. In 1730, he and other leading gentlemen proposed the establishment of a new British colony in America that would provide a haven for the nation's poor and simultaneously serve as a strategic buffer against French and Spanish territorial expansion along the Atlantic Coast. The new settlement—established by charter in 1732 and named Georgia in honor of the king—therefore represented a convergence of Oglethorpe's military and philanthropic impulses.

James Oglethorpe founded the Georgia colony as a haven for debtors and Protestant dissenters. He is commemorated with this bronze statue by Daniel Chester French in Savannah, the site of his first settlement in 1733. (Library of Congress, LC-D416-695)

Oglethorpe in 1732 announced that he would accompany the first shipload of Georgia settlers over the Atlantic. By following through on this pledge, Oglethorpe became the only member of the board of trustees to ever visit Georgia. Although he was granted very limited official authority, he nevertheless became the de facto governor of the fledgling colony, directing nearly every aspect of Georgia's military defenses and civil administration. He personally chose the location for the first town, Savannah, and is generally considered to be the colony's founder.

Because the initial wave of settlers had little experience in operating a government, they were at first grateful for Oglethorpe's strong leadership. They commonly referred to him as "Father," a term that reflected not only their affection for him but also their understanding of his strict sense of discipline. Constables and judges frequently deferred to Oglethorpe's immense stature and prestige. Within a few years, however, a segment of the colony's population grew unhappy under Oglethorpe's stern rule. Many residents blamed him for the colony's initial prohibition on slave ownership, a policy that retarded Georgia's economic development. Concerns over Oglethorpe's role in America were also raised by several trustees in London, who feared that their suddenly famous and powerful colleague might pursue an agenda contrary to the interests of the trust as a whole. Leading trustees fretted about the

endless stream of expenditures arriving from the new colony, which threatened to bankrupt them. Numerous large promissory notes arrived over with Oglethorpe's signature but contained no explanation for the expense.

Slowly but steadily, Oglethorpe's assumed authority was shifted to regularly appointed officials until, in 1738, the trust instructed him to confine himself to his duties as general of the forces of South Carolina and Georgia. In any case, these duties absorbed all of his attention after the outbreak of the War of Jenkins' Ear in 1739. General Oglethorpe mounted a failed campaign against the Spanish outpost of St. Augustine in 1740, but he redeemed himself by soundly defeating a counterattack by a numerically superior force two years later. After a second unsuccessful attempt to capture St. Augustine, Oglethorpe returned to England permanently in 1743.

In his later career, Oglethorpe could not maintain the heights to which his involvement in Georgia had propelled him. He faced a court martial for his unit's lackluster performance in the Jacobite rebellion of 1745. Although he was acquitted, the stain on his reputation may have contributed to the loss of his parliamentary seat in 1754.

Shortly after the outbreak of the Seven Years' War in 1756, the British government denied his request for a battlefield command. Unwilling to sit out the fighting, Oglethorpe adopted a pseudonym and campaigned with the Prussian army.

Until his dying day, Oglethorpe expressed support for the rights of American colonists, even in the face of growing rebellion. In 1785, at the age of 88, the elderly statesman paid his respects to John Adams, the United States's first ambassador to Great Britain. On June 30 of that year, James Oglethorpe died, bringing to a close his half-century relationship with America.

Ohio Country

The land that England's North American colonists called the Ohio Country began at the Ohio River Valley and extended north toward Lake Erie. The Appalachian Mountains and Allegheny River marked the eastern edge of the region, while the Miami River offered a western boundary.

Probably no other part of the North American interior came to have more symbolic and strategic importance than the Ohio Country, prompting the Native Americans to give it their own name, the Middle Ground. To the east of the region lived the Five (later Six) Nations of the Iroquois Confederation, and farther to the east lived the English colonists. To the west and north lived the Algonquin and the French.

Because of the nearly constant fighting that went on between competing Native American groups and between competing European nations, the Ohio Country did become the middle ground for two centuries of violence. King William's War (1689–1697), Queen Anne's War (1702–1713), King George's War (1744–1748), the French and Indian War (1754–1763), Pontiac's Rebellion (1763–1766), and the American War for Independence (1775–1783) all involved the Ohio Country.

At the conclusion of the American War for Independence, the Native Americans could no longer take advantage of European divisiveness in order to preserve their own interests, and white settlers began to see all native people of any tribe as the last remaining obstacle to settlement of the region. The United States then began a process of removing the indigenous people that ultimately left the Ohio Country completely open to white settlement by 1843.

The Fur Trade

Much of the early conflict over this area had to do with the fur trade. For example, the Five Tribes of the Iroquois (Mohawk, Onondaga, Cayuga, Oneida, and Seneca) began trading beaver furs to the French in exchange for metal axes and knives, brass cooking pots, wool blankets, guns, gunpowder, lead, and liquor. The goods were so beneficial to the Iroquois' life that they had hunted down most of the beaver in central New York by the 1640s. Between 1649 and 1654, they used their new weapons to fight and win the "Beaver Wars" against the Erie Indians.

The Iroquois who then settled in the northeast of the Ohio Country became known as the Mingo. Their Beaver Wars initiated 100 years of complex negotiations, shifting alliances, mutually beneficial trade relations, and vicious warfare among all the tribes of the Middle Ground, which became home to the Wyandot (north), Delaware (southeast), Shawnee (south), Miami (west), and Ottawa (northwest).

By the 1750s, cheaper goods, which were easier to supply from the British colonies, coupled with British successes during King George's War, had

diminished the appeal of French goods and led most of the Ohio Country native peoples to become British allies. In response, Canadian governor Marquis de la Galissonnière sent an expedition under Pierre-Joseph de Céloron de Blainville to expel the British and chastise the natives. Céloron's men and native allies burned the Miami trading town of Pickawillany, killing women, children, and British traders and also brutally murdering Pianguisha, a Miami leader also known as "Old Briton" or "La Demoiselle."

When the British did not offer protection to their Native American allies, the Miami, Delaware, and Shawnee returned to their old French allegiances. Events like these convinced the Ohio Country natives that both the French and the English cared more about controlling the land than about honoring their agreements.

Settling the Ohio Country

Meanwhile, the intensifying global conflict between the French and English found traction in the Ohio Country, where the fur trade had become the most important bargaining chip in the power struggle between the European and Native American groups living around the region. The French seized several English trading posts and built fortifications such as Fort Duquesne (present-day Pittsburgh, Pennsylvania). The English Crown granted 200,000 acres of Ohio Country land to the Ohio Company, formed by investors from Virginia to sell Ohio Country land to settlers.

In 1750, the Ohio Company sent Christopher Gist to survey their lands, and, in 1753–1754, they sent one of their investors, George Washington, with Gist and some Virginia militiamen to attack Fort Duquesne. Washington failed, but the fighting quickly spread throughout the entire Ohio Country and became part of the French and Indian War (known as the Seven Years' War in Europe).

A later expedition under General Edward Braddock, which included Washington and the famous frontiersmen Daniel Boone and John Finley, also failed. During the American Revolution, Boone led the Americans' fight against the British and their Native American allies in the Ohio Country; he was captured and adopted by the Shawnee (from whom he later escaped).

The Treaty of Paris at the end of the French and Indian War ceded to the English all French claims to the Ohio Country. The agreement upset the native peoples greatly, since they themselves had never been conquered. Furthermore, the English Parliament issued the Proclamation of 1763, which promised the native peoples that white settlers would remain east of the Allegheny Mountains, but Native Americans felt that Britain failed to enforce it. Worse, the British believed they had made the Native Americans into English subjects and treated them with increasingly heavy-handed policies.

As the Native Americans had become dependent on European weapons and supplies, their situation became desperate. In response, many joined a militant cultural movement led by the Delaware prophet Neolin, who called on his people to return to traditional ways and a mixture of Christianity and Native American spirituality. They also followed the Ottawa war chief Pontiac, whose ingenious tactics seriously threatened the Ohio frontier from 1763 to 1766.

In part due to resentment over the Proclamation of 1763, the colonists revolted and won their independence in the War for Independence. After the war, the Confederation Congress of the United States of America passed the Northwest Ordinance of 1787, which incorporated the Ohio Country into the Northwest Territory. Eventually, the state of Ohio, along with significant parts of Indiana, West Virginia, and Pennsylvania, were created from the Ohio Country.

Oliver, Andrew (1706–1774)

A prominent American royalist, Andrew Oliver was a member of the General Court and the Council. He also served as a stamp official, a provincial secretary, and the lieutenant governor of Massachusetts in the years preceding the American Revolution. His firm commitment to the British Crown allowed him to advance in colonial government, but his intense loyalism ultimately led to his demise.

Born in Boston on May 28, 1706, Andrew Oliver hailed from a long line of successful merchants, officers of government, and ecclesiastical leaders in New England. Oliver's first colonial ancestor, Thomas Oliver, arrived in Boston in 1632, serving as an Elder in the church, while his own father, Daniel, was a member of the Council. Upon his graduation from Harvard in 1735, young Andrew was chosen as a member of the General Court. In later years, following

in the footsteps of his father, he became a member of the Council. Family connections, especially to his brother-in-law Governor Thomas Hutchinson, helped gain him the appointment of secretary of the province in 1756.

When the British Parliament passed the Stamp Act in 1765, Oliver accepted a position as a distributor of stamps in New England, despite American opposition to the proposed tax. Although his appointment allowed him to gain more prestige among his fellow royalist colleagues, it caused a major drop in his popularity among the residents of Boston. As a result of his decision to accept the office, he narrowly avoided losing his seat on the Council.

In the months preceding the enactment of the Stamp Act, many colonial patriots united in violent opposition to the legislation. On August 14, 1765, a mob operating in conjunction with the Sons of Liberty hanged an effigy of Oliver on the "liberty tree" in Boston. Later that evening, the group destroyed a structure being built as the stamp commissioner's office; the following morning, they forced Oliver to publicly sign a pledge swearing that he would never serve as a stamp distributor anywhere in the colonies. Weeks later, on hearing of Oliver's rumored intentions to take up a post as a stamp official, the Sons of Liberty once again compelled him to swear an oath before a justice of the peace, under the same liberty tree, that he would never be directly or indirectly involved in any attempt to collect stamp duties from the colonists.

Although most Americans condemned Oliver for his actions during the Stamp Act crisis, the events of the period gained him new respect among his royal superiors. In October 1770, Oliver was rewarded for his devotion by being appointed lieutenant governor of Massachusetts.

In this position, Oliver once again drew the ire of American patriots when letters he wrote to his secretary of treasury fell into the hands of Benjamin Franklin. In this correspondence, Oliver recommended the dispatch of British troops to the colonies and the criminal prosecution of several prominent American patriots, including Samuel Adams. The intercepted letters were published in various newspapers and were presented to the assembly. Americans throughout the colonies, and especially in New England, demanded Oliver's resignation from office.

Oliver, however, died on March 3, 1774, before his forced removal. His death was a cause of celebration for many American patriots. A coffin, rope, and gallows were exhibited in one of the nearby public offices as one last expression of American opposition to the ministry of the loyalist Andrew Oliver.

Throughout his life, Andrew Oliver was a devoted civil official, unwavering in his loyalty to his government. Although these attributes might have drawn praise and support at any other time, loyalty and devotion to the British Crown in the years leading to the American Revolution appeared traitorous to many colonists. Despite his abilities, attributes, and rich heritage as a governmental leader, Oliver's unwavering loyalty to what most Americans deemed an oppressive regime led to his ultimate reputation as a foe to the American cause of liberty. This reputation was further entrenched after his death, as his sons, William and Andrew, became prominent figures on the side of the royalists during the Revolutionary War.

Oñate, Juan de (c. 1552–1626)

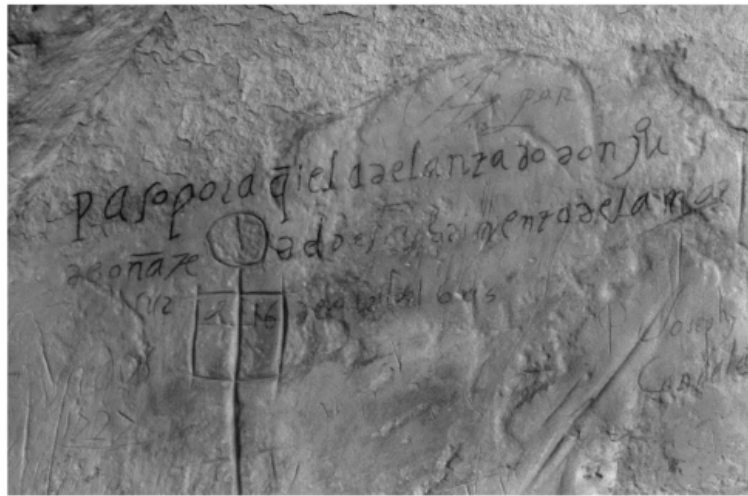

Juan de Oñate gained fame for leading a mission that "rediscovered" New Mexico and established a lasting Spanish presence in the Southwest through the late sixteenth and early seventeenth centuries. Like previous conquistadors, Oñate could be ambitious and brutal, but he also presaged a new era of Spanish government, one that would be characterized more by rules and regulations than by brute force.

Don Juan de Oñate y Salazar was born to Cristóbal de Oñate and Doña Catalina de Salazar in Zacatecas, Mexico, probably in 1552. His father, an ethnic Basque, had arrived in the Americas in 1524, in time to participate in the round of conquests that followed the fall of Tenochtitlán. He received several valuable *encomiendas* (grants of people and land), participated in the founding of Zacatecas, and rose to the post of lieutenant governor of Nueva Galicia.

The elder Oñate maintained diverse holdings in mines, stock ranches, farms, and a sugar refinery, and he displayed his military prowess during the Mixton War (1540–1542). His elite status called for frequent trips between the mining city of Zacatecas and the colonial capital at Mexico City. His son

Juan was exposed to the world of colonial officials, as well as to the more feudal world of the conquistadors.

In the 1570s, Oñate began to participate in the ongoing conflict with the Zacateco and Chichimeca. ("Chichimeca" was a generic term the Spanish applied to many northern tribes they perceived as uncivilized.) The young conquistador led expeditions around Zacatecas, and he also accumulated a sizable fortune through running the family mines and making new silver strikes in the area. His marriage to Isabel de Tolosa Cortéz Montezuma, who was descended from the conquistador Hernando Cortéz and the penultimate Aztec emperor, further improved his position.

Juan de Oñate, the last of the Spanish conquistadors to explore the New World, followed the Colorado River to the Gulf of California in 1604. On the way back, he left an inscription on a sandstone bluff at El Morro in western New Mexico. (© North Wind Picture Archives)

In 1595, Oñate signed a contract for the exploration of New Mexico with Viceroy Luis de Velasco of New Spain. The main goal of the expedition was to discover a route to the ocean, either Atlantic or Pacific, and good ports. Also, special care was to be taken to convert, not harm, native peoples in the process, as stipulated by the Orders for New Discoveries enacted in 1573. As reflected in these regulations, missionary orders, especially the Franciscans, had gained new power over the process of colonization in the second half of the sixteenth century.

The expedition of around 500 people, including 130 Spanish soldiers, finally left for New Mexico in 1598. After establishing a base of operations at San Juan (in northern New Mexico), Oñate immediately set out to find the Pacific coast. In 1601, he tried for the Atlantic. Vastly underestimating the size of North America, he made it to present-day south central Kansas before turning back. Finally, in 1604–1605, Oñate made his way down the Colorado River to the Gulf of California. On the return voyage, he signed the massive El Morro rock outcropping. (In addition to Puebloan petroglyphs and signatures left by American settlers and soldiers, Oñate's inscription is a popular attraction today at El Morro National Monument.)

Juan de Oñate's reputation as an explorer was beyond reproach, but his tactics as governor offended his Pueblo hosts and the viceregal government in Mexico City. Hungry Spanish soldiers began to press the Pueblos for corn and clothing, and the people of Acoma fought back, killing several soldiers, including Oñate's nephew. Oñate decided to make an example of the Acoma Pueblos; a retaliatory raid killed 800 Pueblos, and those who survived were enslaved or mutilated. The surviving children of Acoma were placed in the custody of the Franciscans, a slight nod to the Orders for New Discoveries. These brutal actions put a temporary halt to Pueblo resistance, but it picked up again in the years that followed. Further compounding Oñate's problems was the fact that he had spent most of his money on far-reaching expeditions, hoping to get rich quickly, and had failed to set up a workable base of operations.

Oñate's actions led to his replacement in New Mexico. He spent his remaining years, and what was left of his personal fortune, trying to rebuild his damaged reputation, first in Mexico City, and later in Spain. He succeeded to some extent and earned appointment as the king's mine inspector, although he was permanently banished from New Mexico due to his abuse of the native peoples. Don Juan de Oñate died while inspecting a mine back in Spain in 1626.

Oneida

The Oneida people, one of the five Iroquois nations, emerged as a distinct linguistic and cultural group around 1400. By the time of early European contact in the 1620s, the Oneida may have numbered as many as 3,000, established in a rich and vast territory. Their hunting grounds stretched approximately from present-day Utica, New York, to Lake Oneida and from the St. Lawrence River to Lake Ontario, bordered on the east and west by the Unadilla River and present-day Binghamton, New York.

Early Dutch and French explorers recorded visits to probable Oneida villages, which were palisaded and contained large longhouses that housed extended clans. The Oneida were accomplished fishermen and hunters, living on salmon and deer, as well as cultivated maize, squash, and beans.

As with many other native peoples, however, the coming of the Europeans brought the Oneida exposure to disease and new technology. Smallpox and other epidemics may have halved the Oneida population, while the introduction of gunpowder weapons and the fur trade revolutionized native life. The fur and skins trade resulted in a scarcity of beaver and deer, forcing the Oneida to expand their hunting grounds. This, in turn triggered problems with neighboring tribes and fostered a dependence on European trade goods such as firearms, alcohol, and metal pots and tools. The Oneida also became involved in warfare between the Algonquin/French and the Iroquois/British, which was endemic during the 1650s. The situation was complicated by the conversion of some Oneidas to Catholicism, which tied them to France, while others converted to Anglicanism.

During the colonial wars of the late seventeenth century, the Oneida attempted to remain neutral, but, in 1696, they were attacked by Frontenac as potential allies of the British. Several villages were destroyed, and the population was further depleted. To make up the demographic loss, the Oneida took in refugees from other tribes and frequently adopted captives or remnants of other tribes such as the Tuscarora or Yamasee. Despite this, the Oneida people were increasingly scattered, as some retreated into Canada while others moved south into the Ohio Valley.

The mid-eighteenth century brought continuing waves of epidemic disease, which further weakened the Oneida, and political pressure threatened to split the tribe just as it increasingly pushed the American colonies away from Great Britain. Sir William Johnson, a British Indian agent, was particularly successful at cultivating the ginseng trade among the Oneida, binding some to Great Britain. On the other side, the arrival of the Congregational missionary Samuel Kirkland drew other Oneidas to the colonists' cause. Kirkland, who had failed in an earlier mission to the Mohawks, skillfully identified significant cleavages among the Oneida, caused by the rising power of the warriors over the shamans and elders and by hopelessness due to the failure of traditional ways to protect the Oneida from disease and defeat. Kirkland's fire-and-brimstone Puritanism drew in many converts, who eschewed alcohol, embraced radical Protestantism, and attempted to settle as farmers.

The American Revolution completed this split among the Oneida. The southern Oneida peoples, influenced by William Johnson, followed Johnson's brother-in-law Joseph Brant into the British camp. The northern Oneida sided with New York colonists, even going so far as to supply volunteers for the Tryon County militia. Oneida warriors fought with the militiamen to relieve Fort Stanwix and were ambushed at Oriskany Creek in August 1777 by Joseph Brant. In this battle, colonists were amazed to see several Oneida women fight fiercely alongside their husbands.

Oneida who had connections in the south provided intelligence and took part in the harassing of General Burgoyne's troops on their disastrous march to Saratoga. The Native Americans probably contributed crucially to the victory by significantly weakening the British forces before the battle. There also is a strong Oneida tradition relating how the tribe sent much-needed corn to the starving army at Valley Forge, although this is difficult to corroborate.

Unfortunately, those Oneida fighting with the Americans also were used against the Onondaga, relatives and former allies of the Oneida, in a deadly raid by General John Sullivan. Although Sullivan requested and received officer's commissions for many of the native leaders, the resistance of the Oneida to join the attack was compounded by a retaliatory raid by Brant in July 1780, which destroyed the main Oneida village and left hundreds homeless. General Philip Schuyler grudgingly housed the refugees in barracks at Schenectady, New York, while the Oneida warriors attached to the Americans harried a loyalist invasion of the Mohawk Valley in 1781.

After the war, although treated as allies of the victorious colonies and reimbursed \$5,000 for their destroyed village, the Oneida were quickly squeezed by expansionist New York. New York manipulated the sale of Oneida land, which became three counties in 1784, despite a suit by the state of Massachusetts claiming that the sale was illegal under provisions of the Articles of Confederation; the case was later settled out of court. In 1788, New York allowed speculators to "lease" large tracts of Oneida lands for 999 years, again in contravention of state legislation, ostensibly to protect the Oneida tribe from fraudulent offers from land companies.

In 1795, the new federal government, led by Timothy Pickering, attempted to block New York's further attempts to buy or lease lands in the hands of the Oneida. It was forced to give up in the face of intransigent state officials, who continued to cut land deals with individual Oneidas, even though the land the natives were selling often did not belong to them as single owners.

Steadily, Oneida land in New York was reduced to a fraction of what the tribe had been guaranteed by postwar agreements, and many Oneida began to leave the state for the Ohio Valley or Canada. Even institutions such as the Oneida Academy, established to educate Oneida children, had become bastions of the New York white elite by the 1820s.

With these disappointments, most of the remaining Oneida followed Reverend Eleazer Williams to a settlement in Wisconsin, where a new town at Duck Creek was founded in 1825. New York, which had in 1838 promised to pay the selling Oneida annuities, left the new settlement stripped of this security and instead paid off the whole amount of the land sale in a lump sum in 1839.

Onondaga

The Onondaga are one of the founding nations of the Iroquois Confederacy, a long-standing alliance between the Five Nations of the Iroquois. The confederacy, which originally included the Onondaga, Cayuga, Seneca, Oneida, and Mohawk, expanded in 1722 to include the Tuscarora. The peoples of the Iroquois Confederacy conceived, and continue to conceive, of themselves as families arranged around a single longhouse. The Onondaga, or "People on the Mountain," were located in the geographic center of the Iroquois country, which, in colonial times, stretched across much of northern New York, Pennsylvania, and southern Ontario.

In mythic times, Tadodaho, a furious Onondaga war chief, was soothed by Hiawatha, the founder of the Great League of Peace and Power. In recognition of Tadodaho's conversion, the Onondaga played a role in Iroquois politics that outweighed their small population. The Onondaga were "firekeepers," who would host and moderate meetings between the major chiefs of the Five Nations.

Clan structure and kinship were extremely important in colonial-era Onondaga society, and the clans themselves were divided into two "moieties," or sides, which sat on opposite sides of the fire during diplomatic councils. Within Onondaga villages, as in other Iroquois villages, political life was not exclusively the domain of men. Since women were often in charge of village life while men were away for extended periods, conducting trade, diplomacy, and war, they assumed no small measure of political power in Onondaga villages. Iroquois women also played an important role in the mourning war (a war in which enemy captives were taken to replace dead kin) by determining when it had reached its conclusion.

The onset of European colonization brought significant changes to Onondaga country. Like the other Iroquois nations, the Onondaga allied themselves loosely with the Dutch in an effort to facilitate trade in beaver pelts. It eventually became clear, however, that the French and English would be the major European players in the colonization of the Northeast, and many native communities adjusted their diplomacy to deal with this emerging reality.

The Iroquois were particularly adept at playing the English and the French off one another to maintain their autonomy and position as the main native power brokers of the Northeast. The Onondaga were longtime advocates, and perhaps even architects, of Iroquois neutrality, although this did not save them from a devastating attack by the French and their Algonquin-speaking allies in 1690. In a series of councils in 1700, the Onondaga helped craft a workable Iroquois foreign policy, one of which recognized that the Iroquois had become dependent on European goods and could no longer resist either the French or the English. (The end of the so-called Beaver Wars of the seventeenth century did allow the Iroquois to rebuild and regroup.)

As the eighteenth century progressed, the carefully constructed Iroquois policy of neutrality became increasingly difficult to maintain. The Onondaga still maintained control of their day-to-day lives, but their external affairs were more firmly in the hands of Euro-Americans. The unfolding of the American War for Independence hammered this point home.

As they had previously, the Onondaga people struggled to main their autonomy and neutrality, although the fighting threatened to tear apart the Six Nations of the Iroquois. American forces, believing that Onondaga were supporting the British war effort, attacked the Onondaga. Such offensive action prefigured a new era in which native peoples could not remain neutral.

Following the war, the Onondaga entered into a treaty relationship with the state of New York, which significantly reduced the tribe's land base to 7,300 acres near Syracuse. Some Onondagas relocated to Ontario. In 1815, the prophet Handsome Lake, who, in the early 1800s, had developed a new religion that many Onondagas continue to practice, died and was buried outside the Onondaga longhouse at Nedrow, New York.

The Onondaga in the early twenty-first century have steadfastly maintained that the treaties they signed with New York were not legitimate, thus forming the basis for one of the largest unsettled land claims in the United States. In both Canada and the United States, Onondaga people have continued their role as the fire keepers for the Six Nations Iroquois.

Opechancanough (c. 1545–c. 1646)

In order to understand the impact of Opechancanough's rise to power, one must first have an understanding of the relationship that existed between the native peoples and the colonists in the early Virginia colony. When Powhatan decided to retire, he assigned the leadership role of the Algonquin to Opechancanough, his brother. Powhatan's timing was most prudent, since he made this decision as the Virginia colonists were succeeding in the cultivation of the only crop that they were willing to work at—tobacco. Powhatan's confederacy took on a different demeanor, which strained the already tenuous interaction between the colonists and the natives. Their contacts began as a broad exchange of information and trade, but they were always marked by tension. The colonists had arrived in the New World with the attitude that they were special, and they fully expected friendliness and help from the native population.

The early Virginia colonists depended heavily on Native American support as they struggled to establish themselves and become acclimated to a new world. What the colonists did not realize was that they had begun to settle in the middle of one of the most powerful Native American tribes on the continent—the Powhatan, a confederacy of Algonquin tribes.

The first years at Jamestown were brutal for the English, even though the natives had taught them how to cultivate food crops as well as medicinal herbs. With disease and starvation running rampant in the colony, limiting the number of those able and willing to work the fields, the colonists were forced to depend heavily on the Powhatan. The English demanded food from them—food that the Powhatan knew the colonists could easily have grown themselves, had they not been preoccupied with the constant search for riches with as little labor as possible. This pressure forced the Native Americans both to produce food for themselves and to try to meet the demands of the colonists. Resentment grew as this reliance became expectancy; this, in turn, provided the fuel not only to ignite the anger of the natives as a group but also to damage the previously amicable relationship between John Smith and Powhatan. This animosity made Jamestown a dangerous place for both Native Americans and English.

In 1613, the English unwisely captured Pocahontas, Powhatan's favorite daughter, and brought her back to Jamestown as a captive. In a short period of time, John Rolfe, a most influential colonist, fell in love with her and asked the English authorities and her father for permission to marry her. Both the authorities and Powhatan reluctantly agreed, and the first Anglo-Native American marriage in Virginia's history took place.

This union of two people would not be enough to unify the natives and the colonists. Still, cultural interaction continued and was facilitated by native people living among the English as day laborers. This exchange worked both ways, as settlers, in turn, fled to outlying Native American villages, seeking to escape autocratic English rule and the demands of tobacco planters.

Opechancanough's rule saw a new period of increased violence, as the tobacco planters demanded more and more land to cultivate their crop. A growing population placed more pressure on the Native Americans, as more and more people moved up the Chesapeake, pushing the natives off the land they had held under Powhatan's rule. The newcomers also introduced diseases that the native people were ill equipped to cope with, thus decimating their population. Opechancanough quickly realized that he would have to employ a different strategy in order to save his people.

Opechancanough now embarked on a program of aggression and spiritual renewal within his tribe. He depended heavily on Nemattanew, a war captain and religious prophet, who also provided a humorous interlude for the English, as he dressed up with feathers as though he fully intended to fly. Nemattanew proved dangerous to some of his people, as he managed to convince them that he was immortal and, if they rubbed their bodies with a special ointment, they would be immune to musket fire.

March 1622 saw Opechancanough preparing for a unified attack on the Virginia settlements. Plans were accelerated as the English, in retribution for a settler's death, murdered Nemattanew; his murder was the trigger that set off the combustible atmosphere that came from years of white expansion and pressure on native hunting lands. Two weeks later, the famous Native American assault took place and dealt the colony a staggering blow. One of the casualties was John Rolfe, and his death proved the final blow for the Virginia Company of London, which declared bankruptcy and turned over control of the colony to the English Crown.

By 1640, Virginia had grown to over 8,000 residents. The colony continued to grow, and, by 1662, the population had swelled to 25,000. This force had the ability to reduce the Native American population to numbers that would no longer be considered dangerous to the Virginia colonists and the ever-increasing number of people desiring Virginia as their new home.

Orphans

The possibility of losing one or both parents was common to all children in the early modern period. Parents of both sexes could die of sickness or be killed while working under unsafe conditions. Women often died in childbirth. The transition to North America brought additional complications, especially in the Southern colonies, where the climate was particularly unhealthy for Europeans.

In most circumstances, a child losing one parent could rely on his or her circumstances remaining relatively unchanged. Wills usually provided for the continued support of the family, and bereft spouses often remarried. Most importantly, the surviving parent continued to serve as a protector and an advocate for his or her children. By contrast, orphaned children were left without personal protection or advocacy, and few laws existed to protect their rights until they came of age.

While being left orphaned was traumatic for all children, the financial backgrounds of their parents had a strong impact on their futures. In addition, cultural differences between colonists and regions could dictate how orphans were treated. Children orphaned within close-knit religious communities, such as the Quakers or Mennonites, were often absorbed into other families. These groups looked on all members as being part of the same family; orphaned children were considered part of this extended family and readily adopted. Settlers living in isolated areas, such as the Virginia backcountry, also simply adopted orphans into their families, as towns were too scattered to provide much support.

Under the best of circumstances, wealthy parents left wills specifying who was to care for their children and how they were to be cared for until they came of age. Plans for education, dowries, and other uses of the inheritance could be spelled out. Unlike poor children, wealthy siblings left orphaned could usually rely on not being separated; however, advocacy still remained an important question for wealthy orphans. Until the orphan came of age, the guardian had the right to manage the child's lands or money. Many children saw their inheritances squandered before they reached adulthood. Guardians also could arrange and sign marriage contracts, sometimes arranging for the orphan to marry one of the guardian's children, thus maintaining ongoing control over his or her inheritance.

Poor children left orphaned had few options. If they were lucky, they were adopted by a family member or neighbor and regarded as a full member of the family. In most cases, they were regarded as little more than servants, with no hope of inheriting land or gaining a dowry against marriage.

Another problem was that the transition to North America often broke down family connections. First-generation indentured servants in all parts of the colonies were most likely to be unable to provide their children with extended family members. If orphaned, such children would become dependent on local authorities for survival. Although towns were expected to support their own poor, few rules existed to regulate this support. In addition, most towns had residency rules. If a homeless woman died in childbirth, there was no requirement for the town to provide for the child following her death.

Small towns commonly "bound out" poor orphans. The family who requested the least amount of money from the town for looking after the child would be granted custody. Usually, the child was looked on as a servant. Young children, unable to provide much in the way of labor or personal defense, were often vulnerable. Older children, capable of more skilled work, could be assigned to work off any debt left behind by their parents. The yearly renewal of these indentures offered some hope for transition if a child—particularly if he or she was placed with an abusive family—but children had little say over these decisions.

Larger towns in the Northern and Middle colonies began organizing almshouses in the late seventeenth century. By 1865, Boston had an almshouse where various programs were established to train inmates for future work. Girls were taught to work as domestic servants, boys as laborers. The most common trade in 1740 was "picking oakum," or recycling old rope, along with shoemaking, mop making, spinning wool for mops, and candlewicking.

Although orphanages became more common in the nineteenth century, they were usually as poorly regulated as the colonial almshouses. Organized, federal protection for orphans did not come into existence until the early twentieth century.

Otis, James (1725–1783)

James Otis, a leader of colonial Massachusetts politics and an early contributor to the rhetoric of the American Revolution, was born in Barnstable, Plymouth Colony, on February 5, 1725. His family had gained some prominence throughout the region: His father James Otis, Sr., served in the Massachusetts House of Representatives, despite a lack of formal education.

James Otis, Jr., graduated from Harvard in 1743 and completed his master's degree in 1746. Following his formal training, Otis studied under attorney Jeremiah Gridley and was admitted to the Plymouth Colony bar. Following that, he began his own practice in Barnstable. He practiced law there for two years before moving to Boston in 1750. In addition to his work as an attorney, Otis handled his father's business affairs in Boston and became generally engaged in commerce. He married Ruth Cunningham, the daughter of an affluent Boston merchant, in 1755.

The following year Otis began his tenure as the advocate general of the vice-admiralty court. He resigned his position with the court in 1760 in protest of the writs of assistance issued by the Massachusetts superior court. These writs allowed customs officials to search vessels at will for smuggled goods. Otis presented a lengthy and eloquent argument against the writs of assistance before the high court. The writs, Otis argued, were a violation of common and natural law and trampled on human rights. Otis further declared that any act of Parliament that so impeded the natural rights of the colonists was invalid. Otis's argument against the writs of assistance helped to establish the basic groundwork of the division between Parliament and the colonies. His declaration of the writs as unconstitutional raised the fundamental question of how much authority Parliament had and to what extent that body could exercise sovereign powers.

Otis's argument against the writs of assistance moved him to the forefront of the infant Revolutionary movement. In 1761, Otis was elected to the colonial assembly; in 1764, he was chosen to head the Massachusetts committee of correspondence. The author of numerous pamphlets and letters that outlined the issues of the Revolution, Otis drafted a concise argument against Parliament's efforts at taxation in *The Rights of the British Colonies Asserted and Proved*. Otis opposed later acts of the British Parliament, declaring the Sugar Act a law that taxed the colonial population without their consent.

Otis served as a member of the Stamp Act Congress in 1765, narrowly losing the post of presiding officer to his fellow Massachusetts representative Timothy Ruggles. Although Otis was widely supported by a radical faction within the Congress, the group as a whole tended to adopt a moderate voice of opposition. It declared that the provision of the Stamp Act that granted greater jurisdiction to the vice admiralty courts violated the right to trial by jury.

In 1766, Otis was elected speaker of the Massachusetts colonial assembly, an honor that was disallowed him by the veto of Bernard, the royal governor. The position went instead to Thomas Cushing, one of Otis's followers. Governor Bernard continued his attack on Otis, negating the election of his father, James Otis, Sr., to the Massachusetts Council.

In 1767, Otis attacked the Townshend Acts, another of Parliament's efforts to tax the colonies. He chaired a Boston town meeting that called on the local inhabitants to begin manufacturing a variety of articles—including clothing, furniture, sugar, liquor, cheeses, and jewelry—so as not to consume those items taxed by the Townshend Acts. Together with fellow Revolutionary Samuel Adams, Otis convinced the Massachusetts assembly to adopt the Circular Letter, a document that declared the colonial position and rejected the idea that the colonies could be adequately represented in Parliament. The letter was sent to the speaker of every other colonial assembly in an effort to regain the type of cooperation and harmony that had been evident at the time of the Stamp Act crisis.

Otis's political and philosophical thought helped to shape the ideology of the American Revolution. In 1769, he was attacked by a British customs official and sustained severe injuries. The resulting skull fracture damaged his brain and incapacitated him mentally. After an incident in which he vandalized the State House, Otis was declared insane, and his brother Samuel was named his guardian.

The following year, Otis was removed from public life. He spent the rest of his years at the homes of family friends, no longer recognizable as the strong political force he had once been. On May 23, 1783, Otis was struck by lightning and died instantly.

Ottawa

Ottawa, the capital city of Canada, is located in southern Ontario, on the Quebec border, at the confluence of the Ottawa, Gatineau, and Rideau rivers. When the first Europeans arrived in the early seventeenth century, the Algonquin Indians inhabited the area. They were semisedentary, hunting wild animals such as deer and fowl; harvesting shell and scale fish; collecting roots, nuts, and fruits; and cultivating corn, squash, and beans to supplement their diet.

With the arrival of the French in the early seventeenth century, the Algonquins became middlemen in the fur trade. By the middle of the century, however, they were forced to leave the region by the Huron and Iroquois, who were fighting for control of the fur trade market.

On June 4, 1613, the French explorer Samuel de Champlain, who was searching for a Northwest Passage to the Orient, ventured up the Ottawa River, which the Algonquin then called Kichesippi (the Great River), and which the Europeans later called the Ottawa River (after the local Outaouais tribe). After coming across the present-day site of Ottawa, Champlain stopped to admire the Rideau and Chaudière falls and set up a temporary camp before traveling farther west.

The camp, which was by no means a permanent settlement, became a stopping point for explorers, fur traders, missionaries, and soldiers for the next 185 years. Natural obstacles, such as the Chaudière Falls and treacherous rapids, forced travelers to portage their canoes and set up camps on the north and south sides of the river.

No permanent settlement existed in the area until Philemon Wright and a group of colonists from Massachusetts migrated northward in 1800 and settled on the north side of the river (now Hull, Quebec). They called the settlement Wright's Town. There, they built houses and a mill, and farmed the land. When France blockaded the European ports during the Napoleonic Wars and denied the British timber imports from the Baltic States, Wright and the other colonists built a raft and conveyed timber down the Ottawa River to Quebec City, establishing the lucrative timber trade of the Ottawa Valley.

In 1857, Queen Victoria was asked to settle a dispute between Kingston, Toronto, Montreal, Quebec City, and Ottawa as to which city should become the capital of the United Province of Canada. She chose Ottawa, probably because of its mixed French and English population, as well as its geographic and strategic location on the border of Ontario and Quebec—a decision that was reaffirmed during confederation in the British North America Act of 1867.

Since confederation, Ottawa has remained the capital city of Canada. It is now the fourth-largest city in the country—after Toronto, Montreal, and Vancouver.

Paine, Thomas (1737–1809)

Thomas (Tom) Paine was a leading voice for independence in the American colonies. His widely read pamphlet *Common Sense* helped turn the colonies' dispute with Great Britain into a movement for independence and revolution. Paine's writings, with their sustained attacks on the excesses of hereditary government and calls for greater political power for the middle classes, played an important role in the late-eighteenth-century transition from monarchy and colonialism to republican government and independence.

Born in 1737 in the market town of Thetford, England, to a Quaker corset maker and the daughter of an Anglican attorney, Paine attended a local grammar school until the age of 13. He apprenticed with his father and then moved to London in 1756, where he continued working in trades. After marrying and losing his first wife to a difficult childbirth in 1760, Paine obtained a position as a tax official with the help of his Anglican grandfather.

From his upbringing in Thetford, to his experiences in London, and his service as a tax official in Sussex and Lewes, Paine witnessed firsthand the glaring social, economic, and political inequalities that marked British life. It was these issues that so consumed him during the American Revolution. After arranging a separation from his second wife, Paine returned to London, where he met for the second time with Benjamin Franklin, received a letter of introduction, and set sail for Philadelphia in September 1774.

In the spring of 1775, the conflict between Britain and the American colonies took a turn for the worse as British regulars clashed with Massachusetts militiamen at Lexington and Concord. The colonies were now engaged in an armed rebellion against Britain, but few colonists wanted independence, hoping instead to resolve the conflict peacefully and remain part of the British Empire. Paine disabused his fellow colonists of this hope, beginning in January 1776, when *Common Sense* first appeared in Philadelphia. Within three months, an unprecedented 120,000 copies of the fifty-page pamphlet had circulated throughout the colonies.

A brilliant polemic denouncing monarchy and hereditary government, *Common Sense* was written expressly for a popular audience. Unlike most essayists of the American Revolution, Paine spoke to his betters, his equals, and his inferiors all at the same time, in the same tone, and with the same message. He asserted that the laboring and middling ranks of society should have a greater political role, thus helping legitimize political action during the American Revolution.

Common Sense also contained a ringing plea for independence. The ongoing British efforts to put down the rebellion in New England made reconciliation between Britain and the American colonies impossible, claimed Paine. The colonies had to become independent and sever their ties with the king, Parliament, and the entire British Empire: "everything short of that" would be "mere patchwork."

Common Sense's call for independence, however, did not speak to the difficulties of war. In the months following the Declaration of Independence, the Continental army suffered a series of defeats and withdrawals, and support for the war slipped. Paine responded with *The American Crisis*, a series of essays first issued in December 1776, at the war's low point.

"These are the times that try men's souls," began the first *Crisis* letter, which reminded the now-independent colonists of the high cost of independence and liberty. "The summer soldier and the sunshine patriot will, in this crisis, shrink from the service of their country; but he that stands it *now*, deserves the love and thanks of man and woman. Tyranny, like hell, is not easily conquered," explained Paine as he implored Americans to support the war effort.

The pamphleteer Thomas Paine, whose Common Sense (1776) aroused pro-independence sentiment, also wrote a series of essays, The American Crisis, during the war. "These are the times that try men's souls," it began. (Brown Brothers, Sterling, Pennsylvania)

During the war, Paine continued writing additional *American Crisis* essays and other pamphlets. He served with the army in 1776 and 1777, served as secretary for the Continental Congress's Committee on Foreign Affairs, and, in 1781, served as an unofficial assistant for an American diplomatic mission to France. Paine also remained active in Pennsylvania's and Philadelphia's turbulent wartime politics, serving on various city committees charged with

addressing wartime problems and shortages, and clerking for the Pennsylvania assembly.

The states of New York and Pennsylvania, the national government, and prominent Revolutionaries like George Washington all acknowledged Paine's important contributions to the effort to secure American independence. Pennsylvania granted him 300 pounds, Congress granted him \$3,000, and New York granted him a 300-acre farm in New Rochelle.

In the 1790s, Paine became embroiled in the struggles between the Federalists and Republicans in the United States, as well as in the transatlantic debates spawned by the French Revolution. *Rights of Man* (1791, 1792) was well received by American Republicans. His *Age of Reason* (1795), however, with its deistic attacks on organized religion and orthodox Christianity, garnered him a reputation as an atheist infidel, and Paine fell out of favor with many of his adopted countrymen.

Paine returned to the United States in 1802, after nearly a decade in England and France. He eventually settled on his farm in New Rochelle, where he died on June 8, 1809.

In 1805, Paine's bitter antagonist, John Adams, wrote a tribute. Adams deplored Paine's ideas about society and government, but he admitted "I know not whether any man in the world has had more influence on its inhabitants or affairs over the last thirty years than Tom Paine."

Patriots

A long-standing term in Anglo-American political culture, "patriotism" signified legitimate political opposition to government corruption; "patriots" withheld loyalty to the current state and strove to restore it to an imagined, virtuous, and pure past. In the early eighteenth century, patriots were public men loyal to the state but critical of specific government policies. Patriots were thus critics and reformers rather than vocal defenders of government policy.

By the late eighteenth century, patriotic rhetoric became the hallmark of political radicalism, leading the politically conservative Samuel Johnson to remark famously in 1775 that patriotism "was the last refuge of a scoundrel." By the 1770s, the term "patriot" had become so linked to British radicals that political conservatives used it to defame their political opponents. It was not until the late nineteenth century that those in authority coopted the rhetoric, stripped its long association with political criticism and reform, and used it instead to press for popular approval of government actions.

Patriotism was considered a male virtue, although women did occasionally claim this trait for themselves. A patriot demonstrated love of his country by remaining vigilant, making sure that government bodies remained true to universal principles and respected the rights of the governed. Patriots exhibited virtue by upholding the common good at the expense of individual self-interest through either military or civic service. Assuming that power frequently led to corruption, patriots were expected to curb political injustices by raising critical voices against their own government. Patriots thus remained loyal to their country's permanent ideals, not to specific party interests or government factions; their task was to ensure that particular administrations remained true to abstract moral standards and defended the rights of all Britons.

The oppositional meaning of the term emerged in British politics during the 1720s from three sources. Its first meaning was derived from both Greek political thought and Italian Renaissance humanism, popularized by Machiavelli in Italy and Bolingbroke in England. This tradition upheld the virtues of a balanced constitution and emphasized the patriot's need to fight political corruption, defined as the undue influence of any one branch of the state over the others. The second tradition looked toward an imagined Saxon past, in which a perfect constitution had secured liberty to all. Patriots used this idealized history to urge men to reform the present state in its image. The third source held the greatest sway over American minds. English Protestants held deep convictions that England was an "elect" nation, like ancient Israel, chosen specially by God to be the birthplace of liberty.

These three sources came together in the early-eighteenth-century British mind to make England the natural home of liberty and virtue, blessed with a balanced constitution that was in constant danger from power-hungry and corrupt men. When such men gained influence, the political opposition had a patriotic duty to rise up in defense of their collective liberties and guard against political slavery.

American Revolutionaries found in this oppositional language a powerful means of asserting their critiques of George III's rule and legitimating their Revolution. In the mid-eighteenth century, the word gained popularity among radical Whigs, who emphasized the patriot's duty to protect personal liberty from all forms of political tyranny. From the mid-1760s on, patriots specifically opposed George III, depicting him as a corrupt tyrant, whose administration threatened individual virtue and liberties. While simultaneously critiquing George III's administration, Revolutionary patriots upheld what they claimed were

the true ideals of the British constitution, a political system based on ideals of natural rights and individual sacrifice for a common good. Patriot ideology drew directly from a British radical tradition that included such thinkers as John Locke, John Milton, John Hampden, Algernon Sydney, John Wilkes, and Thomas Paine.

In addition, the term “patriot” retained very strong moral and religious implications to American Revolutionaries. Revolutionary reformers—like their British forebears—used the term to signify their critique of the British government, reminding American colonists that they had a collective moral duty to God to vigorously guard their constitutional rights.

By the American Revolution's outbreak, American patriots were also expected to promote more democratic and egalitarian ideals. For example, in 1777, Virginia's Reverend John Hurt defined “patriot” as encompassing “the idea of a public blessing ... a power of doing good, exerted and extended to whole communities; and resembles” that universal and benevolent “providence which protects and supports the world.”

Americans' patriotism was rooted in their belief that they possessed unalienable rights as both freeman and as Protestants, and that their patriotic loyalty was to God first and the British king second. Such an understanding gave their radical political ends moral legitimacy.

Patroons

A patroon was a landowner in North American colony of New Netherland in the seventeenth century. *Patroon* is a Dutch word for patron or master, and patroons had all the rights, privileges, and obligations of feudal lords, including a degree of legal authority over those who lived on their lands.

After the Englishman Henry Hudson sailed the *Half Moon* into New York harbor on behalf of the Netherlands, he reported his findings to his employer, the Dutch East India Company. The Estates General of the United Netherlands gave the New Netherland Company a monopoly on exploration and commercial development of the colony of New Netherland. The company developed a fur trade, but the government wanted increased settlement to counter its rival, England.

In 1623, a new charter company, the Dutch West India Company, settled thirty Walloon families on homesteads in lower Manhattan, on the western shore of Long Island, in Albany, and along the Delaware and Connecticut Rivers. As colonization was still too slow, in 1629, the company and government jointly issued the Charter of Freedoms and Exemptions.

The charter excepted Manhattan from the patroon system. In the rest of the New Netherland, individuals, with the permission of the governor and council, could claim large tracts of land. All they had to do was pay for transportation to the New World and settlement costs on their land for fifty adults within four years. They would then be patroons, with rights to claim up to 16 miles of riverfront on one side of a river or 8 miles on both sides, and as much contiguous property as the patroon wanted. To get more than the maximum 16 miles of waterfront, however, the patroon had to bring in more settlers. His land thus grew in proportion to the numbers of settlers beyond the original fifty.

On his land, the patroon had full title, legal authority, and absolute inheritance rights. His tenants could fish, hunt birds, or mill grain only with his permission. To enforce his rule, the patroon had the right to appoint magistrates and officers in any town he chose to establish.

The patroon was to establish and document local government compatible with the Dutch government's and the company's rules. He had to select a deputy who met with the company director and council. And each estate had to provide an annual report to Manhattan for transmission to Amsterdam. Patroons also had to provide the people on their land with a teacher, a minister, and a medical person.

The patroon had claim to a tenth of all products of his land. Rent was 500 guilders per year (approximately \$200), and the tenants had to provide both quitrent (fixed rent) and some food products such as fowl and butter.

The most successful patroonship was the Rensselaerwyck, which eventually controlled counties near Albany, Rensselaer, and part of Columbia. Others were the Van Cortlandt manor, which included 85,000 acres, and the Livingston manor, which totaled 160,000 acres. Staten Island was totally the property of Cortnelis Melyn. Thomas Pell had Pelham, while Lloyd's Neck belonged to James Lloyd. Fordham and Scarsdale were patroonships as well.

The patroon administered justice through a court system he established. Settlers on his territory did have the right to appeal his decisions to the director and council on payment of up to fifty guilders (about \$20).

For the first decade, the members of the patroon's colony were exempt from customs and taxes. On the other hand, they could not leave the colony except by written consent of the patron, and the company promised to apprehend runaways. The company also promised to provide slaves, but at its convenience. And it demanded that all settlers outside of Manhattan had to compensate Native Americans appropriately for any land the settlers acquired.

The company barred patroons from trading in furs, a company monopoly, except in territories where the company had no presence. Manufacture of woolen, cotton, or linen cloth, and weaving in general were prohibited, because they competed with Dutch industry. Punishment could include banishment.

Within the limits, patroons could trade from Florida to Newfoundland, but they had to clear their cargoes through Manhattan and pay a 5 percent duty to the company before shipping cargo to Holland. Patroons also could fish and sell their catch to neutral countries; the duty was three guilders per ton. The company also provided defense against all enemies, "outlandish and inlandish," and it fortified Manhattan.

In 1664, the Dutch lost New Netherland to the English, but the English recognized all Dutch titles. Because land was so abundant, many settlers rejected the patroon lands. For a small price, they could acquire native lands without all the rules of the patroon system. The attempt to maintain a feudal land system in an area of virtually unlimited land had little chance of success, and it was gradually phased out.

Paxton Boys

The Paxton Boys were a group of *banditti*—allegedly lawless frontier settlers—from central Pennsylvania. Violence between the native peoples and colonists on Pennsylvania's frontier spun out of control in 1763. In December of that year, the Paxton Boys went on a rampage, massacring twenty peaceful Native Americans at Conestoga and Lancaster.

In early 1764, the now 500-man-strong Paxton Boys marched on Philadelphia to kill 140 Moravian Indians who had taken refuge there and to make their grievances known to the Quaker-dominated Pennsylvania government. In February, Benjamin Franklin and nearly 700 troops and militiamen stopped the Paxtons' march at Germantown, just outside the city, after officials pledged to hear the marchers' grievances and grant amnesty for their actions.

By the early 1750s, British colonists had begun expanding into western Pennsylvania and the Ohio Valley. British expansion worried the native peoples and the French, who claimed the region as their own. The Great War for Empire—which included the French and Indian War (1754–1763), also known as the Seven Years' War (1756–1763)—erupted in this milieu of competing empires, colonial settlers, and concerned Native Americans when Virginians led by George Washington tried to destroy the French Fort Duquesne at the forks of the Ohio River in 1754.

By 1760, the victorious British were laying claim to the entire trans-Appalachian West and Canada. British authorities failed, however, to make a permanent peace with the various native tribes and nations, halt colonists' encroachments on Native American lands, or stop aggression against the native peoples.

Furthermore, the war started a cycle of indiscriminate violence between European settlers and Native Americans in the Pennsylvania backcountry, dissolving already weak relations between the two. In the spring of 1763, natives launched Pontiac's Rebellion, a series of attacks on British forts and colonial settlements across the entire trans-Appalachian frontier.

The settlers on the Pennsylvania frontier, many of whom were Scots-Irish Presbyterians, responded by escalating their attacks on any Native American who happened to cross their path. After a few minor skirmishes in the woods and an attack on native peoples in the Wyoming Valley of Pennsylvania, the Paxton Boys grew frustrated at their inability to stop native attacks. The refusal of the Quaker-dominated colonial government to send troops to western Pennsylvania to assist the settlers in their war against the native tribes infuriated central Pennsylvanians even further.

In December 1763, fifty or so armed settlers from Paxton, Pennsylvania (present-day Harrisburg), turned their fury against a peaceful band of Conestoga Indians living on a small reservation outside Lancaster. After the Paxton Boys slaughtered six natives on their reservation, colonial officials locked fourteen remaining Conestogas in the Lancaster jail to protect them from further violence. The jail and colonial officials proved no match for the infuriated Paxtons, who broke into the jail and murdered the Conestogas. Their outrage against the native peoples and colonial officials who had failed to provide for frontier defense was not yet spent.

In early 1764, a force of some 500 Paxton Boys began their march on Philadelphia. In Philadelphia were two groups whom the Paxton Boys targeted for their vengeance: Quakers and Native Americans. The Quakers were the politicians, who refused to provide money for backcountry defense, while sponsoring the "Friendly Association," a Quaker organization that protected Native American lands and defended native rights against white settlers. That colonial officials were allegedly sheltering 140 Moravian Indians in the city outraged the Paxtons.

Panic ensued when reports of the Paxton Boys' march on Philadelphia reached the city. In order to protect the city from the "Christian white savages," Benjamin Franklin organized a militia company for the city's defense and headed to Germantown to meet these "lawless people." The Paxtons backed down in the face of 700 troops and militia, along with promises that colonial officials would work to restore order to the frontier.

The Paxton affair signified the near-total collapse of native-colonial relations in the period between the Great War for Empire and the American Revolution. As colonial settlements continued to push westward into Native American lands, colonial and imperial officials proved unwilling or unable to meet the demands of the native peoples that the settlers be removed and frontier *banditti* be punished for violence against natives. Similarly, tribal chiefs proved unable to restrain younger warriors, who insisted on attacking white settlements so as to halt white expansion and exact revenge for violence committed against their people. After 1760, the Pennsylvania backcountry became the scene of intense, indiscriminate violence.

The Paxton affair also reflected the growing religious, ethnic, regional, and political rifts in late colonial Pennsylvania. Distrust between Scots-Irish Presbyterians in central Pennsylvania and Quakers in eastern Pennsylvania grew after 1740, erupting during the Paxton affair. This event also had important ramifications for the American Revolution in Pennsylvania. Native peoples in western Pennsylvania sided with the British, who pledged to halt white settlement and expansion, while hostilities between the Scots-Irish and the Quakers became the defining force in Pennsylvania politics during the American Revolution.

Peddlers

As colonial settlement grew and the frontier was pushed westward, agricultural areas expanded faster than urban areas. For many people living on the frontier, and even for those in more established regions, markets, urban shops, and country stores were not always close by. Peddlers, often called hawkers or chapmen, brought sought-after wares to settlers' doorsteps and played an important role in colonial economic and social development, especially in New England.

While colonial farmers have often been portrayed as living within a subsistence economy, their survival was, in fact, tied to a market economy. The long distances between most frontier homes and a market, however, meant that farmers were not willing to make the difficult, time-consuming journey when they needed only a few items.

Peddlers, with their traveling stores, were a welcome sight for those living in more isolated areas, as they provided easy access to necessary goods. Most peddlers did not deal in large items, because their horses and wagons could carry only a limited weight. Instead, they hawked such smaller products as books (including chapbooks, or small anthologies of writings, hence the name "chapman"), combs, buttons, needles, kitchen implements, and medicines. The peddler also brought with him news and gossip, and he provided fresh company to lonely frontier families.

While peddlers served an important economic and social role, they were also generally disliked. Although consumers welcomed the opportunity presented by the peddlers, they resented having to pay a higher price for the goods because of the convenience of the system. Many local merchants used this argument against peddlers; they also contended that these itinerant salesmen sold inferior goods, although many peddlers obtained their goods from the same merchants who openly criticized them. For the owners of urban and country stores, peddlers were competitors, who forestalled isolated farmers and their families from coming to their stores, where these shoppers usually made large purchases.

Other negative stereotypes of peddlers included connecting them to criminal networks, and many goods hawked by peddlers were assumed to be stolen. Other peddlers were accused of purchasing their goods on credit but never returning to pay for them.

These issues—including competition, crime, and debt—caused most colonies to regulate peddlers' activities. A South Carolina law of 1737 ordered that each peddler needed to be licensed to legally practice his trade. In 1765, Connecticut passed a law that required each peddler to pay an annual fee of 20 pounds. In 1767, New York outlawed peddlers and established a fine of 5 pounds for anyone caught hawking goods; this decision was later reversed, when it became clear that peddlers served an important role. After the return of peddlers to New York, it was decided to create a licensing system with a fee of 8 pounds per horse and a fee of 5 pounds per wagon or sledge.

Peddlers played a vital economic and social role by supplying needed goods to remote areas and—like these hawkers of tea water—more specialized commodities in urban areas. In either case, peddlers also facilitated the exchange of news and gossip. (Brown Brothers, Sterling, Pennsylvania)

Colonial peddlers have not received the same amount of historical attention as larger urban-based merchants. Yet by moving within the ever-changing boundaries of settlement and connecting the settlers of these regions with the larger market economy, they played a vital role in colonial expansion and in the continued growth and development of the American economy.

Penn, William (1644–1718)

William Penn was born on October 14, 1644. His father, an English naval officer, had married Margaret Jasper Vanderscure on June 6, 1643. As a child, Penn was quiet and introspective. He saw little of his father, who was generally away at sea, and spent most of his childhood secluded in the family home with his mother.

Penn had little formal education. He attended the Chigwell Free Grammar School for less than a year. In 1656, the family moved to an estate in Ireland. King Charles II rewarded his father's loyalty with a knighthood in 1660. Sir William was also given a royal commission in the Navy and a larger Irish estate. The family then returned to London.

At the age of 16, Penn enrolled in Christ Church College at Oxford. An avid reader and quiet by nature, he disliked the Oxford climate and left after just two years. In July 1662, Penn traveled to France, where he attended school at Saumur, a Protestant seminary, returning to London after two years. His father enrolled him in law school at Lincoln's Inn, the "finishing school" for well-to-do gentlemen.

When war with Holland erupted, Penn's father was returned to active service, and he took William with him on his flagship. The king's brother, James Stuart, the duke of York, accompanied the Penns. After a time, Penn was sent to London with dispatches for Charles II and then returned to law school. Despite several victories in the war, rumors of the duke's incompetence surfaced, and the elder Penn claimed for himself the blame being placed on the duke, thus damaging his own reputation. His actions cemented a lifelong friendship with the royal family, a connection that would serve Penn well in later years.

Penn as a Quaker

In 1667, Penn left Lincoln's Inn, traveling to Ireland to settle a lawsuit over the family estate. Penn also served as a military aide during the insurrection of disgruntled soldiers at Carrickfergus, action in which he distinguished himself. His success spurred him to pursue a career in the military, but he was denied a position in the army. It was during this time that Penn became a Quaker. He had long been acquainted with Quaker beliefs, but it was while he was in Ireland, under the influence of Thomas Loe, a disciple of the Society of Friends' founder George Fox, that Penn converted.

Penn quickly became a defender of his fellow Quakers and their beliefs. His publication of *Sandy Foundations Shaken*, a pamphlet that was part of an ongoing debate with Thomas Vincent, a Presbyterian minister, resulted in his imprisonment in the Tower of London for libel. Refusing to recant, Penn remained in prison for seven-and-a-half months until his father petitioned the Privy Council for his release. Penn authored 150 books and pamphlets over the course of his life, writings in which he consistently argued for toleration of nonconformity. Penn believed that a person's conscience belonged only to God, a belief for which toleration was an absolute necessity.

On April 4, 1672, Penn married Gulielma Maria Springett. They had seven children, four of whom died in infancy. Only Springett, Letitia, and William (Billy) survived to adulthood.

In 1675, Penn became a trustee for the colonial venture in New Jersey. While this was not a wholly Quaker colony, many members of the sect were involved in its ownership and settling. Penn helped to frame the constitution for the colony in a document entitled "Concessions and Agreements."

Founding of Pennsylvania

Inspired by his work with the New Jersey colony, Penn formally requested an American land grant from the king on June 1, 1680. His father's loyalty to the royal family and the unpaid debt owed him aided Penn's request, and on March 4, 1681, Charles II approved the patent for Pennsylvania. Penn became the sole proprietor of roughly 45,000 square miles of unexplored land in the American colonies. The patent was geographically imprecise, leaving Penn unsure of exactly what land he owned, and resulting in a prolonged dispute over the southern boundary.

Penn began his "holy experiment" with grandiose ideas of religious freedom and financial success. He began selling land subscriptions of 5,000 acres, hoping to establish a colony of prosperous Quakers. Only 41 subscriptions of that size were sold at the cost of 100 pounds each, a number far short of his original goal of 100 subscribers. In the absence of wealthy investors, Penn sold 430 subscriptions to smaller investors, at an average of 750 acres. Most of these subscribers were skilled laborers, though the number included some professional men, two teachers, three doctors, and seven single women. These investors immigrated almost immediately.

For his capital city Penn envisioned what he called the "city beautiful" plan, an ideal that proved unrealistic. Investors were slated to receive a bonus grant of 10 acres in the city lot in order to build townhouses. Penn sought to avoid the crowded and polluted conditions of European cities. No homes were to be built closer than one-quarter mile from the waterfront. The city was to have two large open squares and smaller ones in every quarter. Two main highways as well as several smaller streets were to provide a grid on which to organize the city. Streets that ran north and south were to be identified by numbers, while those running east and west were to be named after types of trees. Given the limited financial means of most of his investors, Penn eventually reduced the size of the land bonuses, as well as allowing for the establishment of smaller back streets that would accommodate the less affluent.

William Penn, a prominent English Quaker, spent seven months in prison and wrote scores of books and pamphlets on religious toleration. Finally obtaining a land grant in 1681, Penn founded the colony of Pennsylvania. (Private Collection/Bridgeman Art Library)

In 1681, as Penn was drafting the frame of government for Pennsylvania, his mother died. Penn had been close to his mother and was now orphaned, his father having died in 1670. During this time Penn relied heavily on his advisers in Pennsylvania. Early in 1682 he dispatched Captain William Markham to the colony to determine a site for the capital and establish friendly relations with the native population. Penn himself arrived in the colony late in 1682.

Penn in Pennsylvania

During his tenure there, Penn and the elected colonial assembly adopted his Frame of Government (later known as the Charter of Liberties), the basis of Pennsylvania law for nearly a century. Among its provisions were universal manhood suffrage, and fair and open trials for those accused of a crime. The law also opened the colony to persons from all religions, with no threat of persecution.

The government of the colony consisted of a governor with limited powers and a deputy governor. The Provincial Council, a seventy-two-member body, proposed legislation. The General Assembly could have up to 500 members and had as its responsibility the approval or defeat of legislation proposed by the council. One-third of the members were elected each year and each served a term of three years. The governor held the power to veto legislation.

In addition to establishing a working government, Penn also labored to achieve good relations with the native peoples in the area. Penn was convinced that no minorities should suffer persecution, as the Quakers had in England. As part of his effort, Penn purchased the land of Pennsylvania from the Native Americans and instructed officials to treat them as equals. Penn also insisted that negotiators utilize translators. Peaceful relations with the Susquehannock, Shawnee, and Lenni Lenape resulted from Penn's efforts; Penn also gained a reputation of courage among the native population.

Penn returned to England in 1684, his primary goal being the resolution of Pennsylvania's southern boundary. When James II assumed the throne in 1685, the dispute was settled, with the territory in question being equally divided, half going to Lord Baltimore and the other half reverting to the Crown. Penn spent many years as an active member of the royal court, his influence evident in the 1687 royal proclamation that declared liberty of conscience for all. Penn's favor with the court disappeared when William of Orange overthrew the Stuart dynasty.

Penn's Final Years

In 1692, Penn's wife died. Five years later, he married Hannah Callowhill, a fellow Quaker from Bristol. Hannah gave birth to seven children, four of whom died very young. The surviving children—John, Thomas, and Richard—would all play roles in the American colony. In 1699, Penn, Hannah, and Letitia sailed to Pennsylvania, where the first of his children with Hannah was born. John Penn was the only one of Penn's children to be born in America.

During his second visit to the colony, Penn successfully concluded the 1701 treaty with the Potomac Indians, establishing commercial relations with them through authorized representatives. In 1701, when he learned that legislation to return the proprietary colonies to the Crown had been introduced in the House of Lords, Penn returned to London. During this time, he also faced charges from his financial adviser, Phillip Ford, who had embezzled much of Penn's income and tricked him into signing a document transferring the ownership of Pennsylvania to Ford.

In October 1712, Penn suffered a stroke, followed by a second one four months later. The resulting paralysis left him unable to attend to the business of running the colony, a role that his wife Hannah assumed. Penn died six years later on July 30, 1718.

Pennsylvania

In modern American mythology, Pennsylvania represents a distinctive part of the American tradition. If New England provided the sense of destiny and mission, and Virginia contributed unfettered capitalism and individualism, Pennsylvania offered liberty, tolerance and diversity.

With this central role, Pennsylvania has contributed mightily to the development of both colonial and modern American society since its founding in 1682. To understand what factors played such major roles in shaping Pennsylvania, one must begin by examining the founder of the colony, William Penn.

Quakers

Son of a prominent admiral in the British navy, William Penn grew up in a prosperous, elite family. The stability and harmony of his childhood was not replicated in the broader context of the English nation during this period, as the English Civil War (1641–1649) and the resulting Protectorate of Oliver Cromwell caused deep divisions within English society. Catholics and proponents of a high church were driven into hiding or exile, while Protestant dissenters from the Church of England, such as Puritans and Quakers, multiplied in number and political power at the end of Cromwell's reign. With the collapse of the Protectorate in 1661 and the Restoration of King Charles II in the same year, civil war and military strife ceased, but the devastation of property, lives, and society was to be felt in the years to come, well unto the Glorious Revolution of 1689.

Quakers were among the most notorious Protestant dissenters during this period. Denying traditional religious authority, Quakers instead followed the authority of the "inner light"—that is, they believed that the Holy Spirit is present and works in the minds of living believers as it did in Jerusalem during the life of Jesus. Preaching a doctrine of tolerance, humility, simplicity, and love, Quaker evangelists were present throughout England, arguing for freedom of religion and tolerance for all Protestant believers.

The British civil authorities and Church of England responded harshly to such pleas, jailing large numbers of Quakers for refusing to attend Anglican services. Nearly 10,000 Quakers languished in jail during the 1660s, yet this effort to quash the Quaker faith failed as its membership rose throughout England. Preachers like George Fox persisted in spreading Quaker doctrine despite the threat of imprisonment and freely offered their words to all who would listen.

In 1660, William Penn, a student at Oxford University, accepted Quaker teachings and refused to attend Anglican services at college. This action infuriated Penn's father, who promptly sent his son on a grand tour of Europe to get radicalism out of his system. This effort failed, and, by 1667, William was jailed for publicly supporting the Quaker cause. Over the next decade, Penn was repeatedly harassed for his efforts to promote religious liberty in Great Britain.

By the 1670s, however, Penn's fortunes changed. In an effort to gain broader political support, King Charles II pushed for religious tolerance and started to cultivate Penn's favor. While this alliance can be explained as the result of politics, the king owed William's now-deceased father a fortune, as the senior Penn had given him loans to support his lavish lifestyle. When the king offered grants of land in cancellation of his debts, he found the right man in William Penn, as the latter sought a site in North America where Quakers could settle and enjoy religious freedom. In 1681, Charles II granted Penn control over the lands from Maryland to New York—an area soon named Pennsylvania in the proprietor's honor.

True to his Quaker principles, Penn established a constitution for his new colony that provided for religious liberty. He also actively promoted his new holdings to those in England and throughout Europe who sought a safe haven from the war-torn continent and marauding armies as well as a refuge from the religious intolerance that had been widespread since the early days of the Reformation.

Founding of Pennsylvania

With the launching of William Penn's colony, settlement quickly commenced. A large portion of the 10,000 Quakers who arrived in Pennsylvania before 1700 began their journey from the North Midlands region of England. In time, this region provided the elites of Pennsylvania's colonial society, as these first families intermarried and pursued close business and political alliances. Along with these Quakers, nearly an equal number of settlers came from the northern regions of Germany and Scotland, which had long suffered from a lack of economic opportunity and the heavy hand of war. To say that diversity is an essential part of Pennsylvanian history is an understatement; this pluralism provided both opportunity and conflict from the beginning.

Opportunity was available for the new colonists for a variety of reasons. First, the natives who lived in the Delaware River Valley—the Lenni Lenape or Delaware tribe—had been weakened by disease and were small in number and influence. Although this condition explains part of the reason for amicable relationships between the natives and newcomers, the fair and even-handed treatment that William Penn gave to the Lenni Lenape provided for long-standing peace and made warfare a foreign concept in the region for nearly sixty years. New settlers in Pennsylvania were also blessed by a relatively temperate climate and extremely fertile soil, which allowed for a long growing season. Finally, the stated tolerance in religious affairs saved Pennsylvania from some of the conflicts that marked the New England and Virginia colonies.

Despite these opportunities, discord arose among the settlers of Pennsylvania. Non-Quakers resented Penn's favoring of the group via choice land tracts and property in Philadelphia. The Quaker elites frowned on the Presbyterians and Reformed farmers from Scotland and Germany who sought to ignore land claims that Penn had established. All agreed, however, that as a proprietor, William Penn retained too much political power, limiting the legislature's say in colonial affairs, and they refused to pay the rents that Penn charged for use of his lands.

By the time of Penn's death in 1718, he was heavily in debt owing to a lack of return on his colony. He lamented that his dream had been taken over by "brutish" settlers intent on having their own way, resulting in the "harmonious society ruined."

By 1723, the colony of Pennsylvania had fulfilled some of Penn's hopes but dashed others. The colony was indeed a haven of religious tolerance. As a result, a heterogeneous mixture of Protestant groups and sects arrived in the Delaware River Valley. With all this diversity, however, these groups quickly found plenty to disagree about, especially issues of land and representation in the Pennsylvania Assembly, which had gained much power in 1700. The existing system of representation favored the established Delaware Valley region, which was heavily settled by Quakers (especially Philadelphia), over the rapidly expanding Presbyterian and Reformed population in the backcountry of the colony. This geographic and religious division remained until the early 1800s. Colonial politics in Pennsylvania often became nasty; the politics of the region became even more confrontational over the issue of the Penns' powers.

Hence, the Quaker elite, which was overrepresented in the assembly, divided into "proprietor" and "antiproprietor" factions. The Proprietor Party tended to be conservative in religious and cultural matters, strongly supportive of the Penn family's administration of the colony, and drawn from the Quaker merchant elites. The Antiproprietary Party was made of landholders who resented the taxes on the land, were strongly supportive of immigration to the region, and were hostile to the Penns' control over Pennsylvania.

Into this situation, in 1723, stepped Benjamin Franklin, the man who would define Pennsylvania like no other for the next sixty years. Fleeing from both an oppressive brother and a lack of economic opportunity in Boston, Franklin quickly established himself in the printing business in Philadelphia. Over the next ten years, he learned the trade, honed his love of science and invention, traveled to England, and formed numerous well-placed connections on both sides of the Atlantic.

The city of Bethlehem in eastern Pennsylvania (later a center of steel manufacturing) was founded in 1741 by Moravian exiles from Europe. The Pennsylvania colony, William Penn's "great experiment" in religious freedom, also attracted other pacifists such as Quakers and Amish. (Library of Congress, LC-USZ62-43546)

By 1732, Franklin began publishing the *Poor Richard Almanack*, as well as the *Pennsylvania Gazette*, and these publications made him a well-known and wealthy man. Certainly his invention of the Franklin stove did much to gain him renown as an inventor, but the fact that this device also filled his pocket

with money should not be ignored. Franklin was all things: a man of enlightenment, reason, creative ability, and keen awareness of the bottom line. In short, Franklin is best understood as a reflection of his times, during which Pennsylvania saw both continuity and transformation.

Growth of Pennsylvania

Between 1725 and the commencement of the French and Indian War in 1754, the population of colonial Pennsylvania exploded. While the population of 1715 was a mere 70,000, it grew to nearly 430,000 settlers by 1760. Although a high natural birth rate and economic prosperity explain part of this growth, the sheer number of immigrants to the region must also be taken into account. Nearly 150,000 Scots-Irish and Germans filled the western region of the colony, expanding Pennsylvania's border to the Susquehanna River.

While the countryside saw a large increase, Philadelphia also witnessed a dramatic expansion, doubling in population to 23,000 by the eve of the American Revolution. This growth occurred partly because the town became a center of transatlantic trade, but it was also due to the growth of an artisan class that provided goods and services to the elite families of the colony in many different ways.

Finally, many indentured servants did their term of service in Philadelphia; likewise, the number of African slaves in the town increased drastically and amounted to 9 percent of the population by 1750. The world of Pennsylvania and Ben Franklin from 1725 to 1754 was one of expansion, growth, and diversity in many respects.

With these changes in the makeup of Pennsylvania society, other changes in the colony reflected general trends in the British colonies of North America. By 1750, Pennsylvania was losing the egalitarianism that had marked the colony since its founding. The richest 10 percent controlled nearly 40 percent of the wealth, up from nearly 20 percent from 1715. In contrast, the middling artisans of Philadelphia saw their average yearly income decline from 30 to 23 pounds over the same period. Hence, economic opportunity was decreasing in the urban areas and inching closer toward the situation in Boston, where a few elite merchants increased their control over the wealth, power, and politics of the community throughout the eighteenth century.

With the idea and reality of social harmony and equality rapidly disappearing, many Quakers gradually withdrew from social and political activity. Their almost total absence after the end of the French and Indian War allowed for other groups, primarily the Anglicans, to gain control over the colony, as well as the levers of society. This shift was displayed most prominently in the legislative battles of the Pennsylvania Assembly, which had remained divided between the Proprietor and anti-proprietor parties until the crisis of the 1760s. The latter party increasingly advocated royal control over Pennsylvania, arguing that the needs of colonial merchants and commerce would be served without the tiresome burden of Penn family control.

The leading advocates of this new platform were Ben Franklin and Thomas Galloway. Their vicious campaign against proprietor control gained them friends in Great Britain and the Pennsylvanian backcountry, as the new settlers resented the favored status of the native tribes in the region.

French and Indian War

The French and Indian War commenced with George Washington's failed offensive against the French near present-day Pittsburgh in 1754. Part of a global struggle, known as the Seven Years' War, whose main theater was in Europe, the French and Indian War was the final colonial struggle between the British and French for global mastery.

In North America, the French gained the upper hand quickly, as British regulars under the command of Braddock were annihilated in 1755, not far from where Washington had met defeat nearly a year earlier. The failure of British offensives in Pennsylvania's backcountry, along with spectacular French success along the New York frontier, led to a reassessment of British war efforts by late 1757.

With the accession of William Pitt, the elder, as prime minister and architect of British global strategy, the focus of the global conflict shifted to North America, and Pitt demanded increased colonial support for the imperial cause. The pacifist heritage and continued Quaker presence in Pennsylvania hindered British efforts to mobilize the militia and severely limited the colony's contribution to the war effort.

Within Pennsylvania society, the lack of Quaker support for the British caused deep division along religious and regional lines. The pacifist groups, which included most Quakers, Amish, and Moravians, lived in the long-inhabited Delaware River Valley, where there were no hostile Native American tribes nearby. The situation in the backcountry stood in stark contrast to that in the eastern regions, as the French and their allies threatened the Scots-Irish Presbyterians and Reformed Germans. Not surprisingly, these backcountry groups deeply resented the failure of the elites to provide an effective defense, and a group of such disgruntled citizens called the Paxton Boys marched upon Philadelphia when the colony failed to settle a dispute between settlers and natives after Pontiac's Rebellion in 1763.

Briefly stated, while the British and colonial efforts against the French resulted in a decisive victory on the Plains of Abraham in 1759, the conflict revealed deep divisions in Pennsylvania society. The diversity and pluralism that marked Pennsylvania from its beginning yielded bitter fruit well after the commencement of the war in 1763.

The efforts of British colonial administrators to pay for the immense burden of empire following the expensive conflict dominated the next and final epoch of colonial Pennsylvania. Over the 1760s, administration after administration of the British government sought to pay for the French and Indian War by increasing the tax burden on the American colonies through a variety of import and trade taxes.

In Pennsylvania, the long-prevailing political divisions between the Proprietors and the royalists led by Benjamin Franklin continued well into this period. The Proprietor forces, led by John Dickinson, opposed British efforts to gather taxes by arguing that without colonial representation in the English Parliament, these new fees and dues encroached on the colonists' personal liberties. Interestingly, Franklin supported many of the British taxes, arguing that imperial control over Pennsylvania was simply better than being under the thumb of the Penn family.

In the 1770s, as the conflict with Britain approached, Pennsylvania remained deeply divided along the ethnic, religious, and regional lines that had ruptured during the French and Indian War. When the Congress gathered in Philadelphia declared independence in 1776, the Pennsylvania delegation remained split, as Dickinson abstained and Franklin vocally pressed for independence along the lines of his Albany Plan of 1754.

When British forces defeated Washington at the battle of Brandywine Creek in the fall of 1777 and occupied Philadelphia two weeks later, many of the Quaker elite welcomed British soldiers into their homes and left with the British forces when the town was evacuated in the spring of 1778. The diversity, tolerance, and liberty that had marked the Pennsylvania of William Penn was supplanted by bitter and deep division by the time of the American Revolution.

Pequot

The Pequot lived along the lower reaches of what became the Thames and Mystic Rivers in southeastern Connecticut. They inhabited two fortified towns and an unknown number of small settlements along the coast and on small islands lying close to shore, with trade and kinship connections to Long Island.

The tribe developed as close relations of the Mohegan. A legend about the tribe's origins, probably incorrect, has the Pequot "invading" New England from the west, and the Mohegan, under Uncas, seceding from them in the mid-1630s. The close kinship connections between these two tribes, who together had about 16,000 people in 1600, not only blurred their differences but also helped the Pequot challenge the Narragansett for access to the fur trade with the Dutch in the 1620s. Unfortunately, those connections and the upheaval created by the trade also lay the groundwork for the intertribal politics that, after the ambitious Uncas became the Mohegan sachem, resulted in the 1637 war that nearly wiped out the Pequot.

The Pequot War of 1637 was the first significant conflict between native peoples and European colonists in New England. This period engraving depicts a Pequot fort in Connecticut surrounded by colonial musketeers and an outer ring of Mohegan allies. (New York Public Library, New York)

The 1633 smallpox epidemic decimated coastal native peoples, including the Pequot, but left the rival Narragansett relatively undisturbed. The Pequot tried to strike at the resulting Dutch-Narragansett trade axis but only angered both groups, resulting in a Dutch raid in 1634 that killed their chief sachem. In desperation, Sassacus, the new Pequot sachem, approached Boston for help and offered the town a trading post along the Connecticut River in

exchange for arranging a truce with the Narragansetts. The Bay Colony agreed to arrange the truce, but instead of the trading post, the colonists asked for and received tribute from and title to the whole Connecticut Valley. They also demanded custody of those suspected of killing John Stone, an English sea captain, and his crew.

This imposed agreement became a step along the road to the Pequot War, as English settlements quickly sprouted and the Pequot began to feel besieged within their territory. Tribal leaders found their situation increasingly tenuous as they tried to meet the continued English demands to turn over Stone's murderers, compete with the Narragansett, and maintain the allegiance of outlying villages. Sassacus began to lose power as some of his sachems, such as Wequash, began to strike out on their own or even join with Uncas's Mohegans, who were increasingly allied with the colonists.

In early 1636, the English built Fort Saybrook at the mouth of the Connecticut River, signaling that they intended to become a permanent power in the area. That summer, the Pequot were blamed when trader John Oldham was found murdered on his ship; in August, Massachusetts dispatched an expedition under John Endecott to obtain revenge for Oldham. Negotiations went nowhere, and the English raids accomplished little but drive the tribe into war, as the Pequot began raiding settlements and killing isolated colonists. Sassacus also sought to establish an alliance with the Narragansett against the English, but he failed, as that tribe instead formed an uneasy alliance with Massachusetts.

The Pequot continued to hit English outposts and, in February 1637, tried to cut off Fort Saybrook. As winter turned to spring, Pequot raids intensified. On April 23, they attacked Wethersfield and killed nine colonists. This led Connecticut and Massachusetts to mobilize, raise an army, and seek the assistance of Plymouth, the Mohegan, and the Narragansett. On May 26, this force attacked and destroyed the Pequot fort on the Mystic River, using surprise, fire, and ruthless slaughter to kill about 650 inhabitants, mostly women and children, since Sassacus and his main body of warriors were at the other Pequot fort at Weinshauks.

The English tactics and massacre of the Pequot horrified their native allies. Many Narragansetts left, leaving the Puritan-Native American force vulnerable. But the Pequot, who were shocked by their defeat and blamed Sassacus, were unable to agree on a single course of action. Some fled to Long Island or Block Island, and others sought refuge with the Narragansett, who competed with the Mohegan to "adopt" the greatest number of Pequot and increase their power in the region.

The largest group, with about 300 men led by Sassacus, headed west to join the Mohawk but were closely followed by Mohegan bands and a fresh colonial force. On July 14, another major battle, at a swamp west of modern New Haven, resulted in the capture of 180 Pequots and the killing of many more. Sassacus escaped with his brother and other Pequot sachems and finally reached Mohawk country. There, he and his party were set upon and slaughtered by those he had hoped would provide refuge.

After the Pequot War

The Pequot tribe was declared extinct as part of the 1638 Treaty of Hartford. Because the Puritans initially insisted that the survivors join a "friendly" tribe, about 800 were incorporated into the Mohegan; another 440 lived under Narragansett authority (which would later become the Eastern Pequot); and about 400 remained nominally under Mohegan control around the Thames River and Niantic Bay.

Within five years, Connecticut settlers, anxious about Mohegan ambitions, allowed the reconstitution of two Pequot groups under the leadership of Wequash and Robin Cassasinamon, who had been English allies. Their bands would, over the next few decades, become the Stonington or Lantern Hill (eastern) and Mashantucket (western) Pequot communities. Ironically, Uncas's continued efforts to "enlist" members of the two bands in his tribe enabled the Pequot survivors to obtain more autonomy and power—although under English domination.

When the Pequot and their English neighbors complained of Mohegan raids, Puritan leaders in the new United Colonies rebuked Uncas and arranged autonomy and reservations for Wequash and Cassasinamon in exchange for tribute paid to Uncas. In 1651, the colony gave land to Cassasinamon's band at Noank, which had been part of the original Pequot territory. In September 1654, the commissioners of the United Colonies declared the Pequot remnants under their protection and a year later "appointed" Wequash and Cassasinamon community leaders. They also issued rules that included an end to traditional ceremonies. In 1658, the Pequot got Connecticut colonists to recognize their right to additional land at Mashantucket (near Stonington) and persuaded the colonies to give them access to the wampum shell beds on Long Island.

When King Philip's War broke out in 1675, the Pequot men fought for the English in independent units and as scouts with the Connecticut militia. When the war ended, the Pequot were allowed to resettle in peace. The smaller eastern band made their home on 280 acres claimed by both Massachusetts and Connecticut but granted by both to the Pequot group. The western band soon faced problems with a conflict over community leadership as well as efforts by the town and colony to take their lands at Noank, although they were still allowed to fish and hunt there.

After making the move to Mashantucket, two distinct communities developed, one associated with Cassasinamon, the other under Daniel and then Schadab. As with the Mohegan, efforts by Connecticut authorities to choose the Pequot sachem, favoring Daniel and Schadab rather than Cassasinamon, failed to unite the tribe and left at least half very unhappy with the province.

During the early 1700s, about 325 Pequots lived at Mashantucket and about 150 at Lantern Hill, both probably maintaining residence and subsistence patterns very similar to those of a century earlier. Slash-and-burn cultivation of maize, hunting, and seasonal movements to the coast (at Noank) continued. At Mashantucket, the only archaeological evidence of European ways is apple orchards and pig bones.

During the eighteenth century, the Pequot population on the reserves declined steadily as men died in the colonial wars or as they moved away to work as laborers or seamen and the colonists encroached on their reserves. As with the Mohegan, members of the tribe resisted Christianity until the Great Awakening offered a sense of spiritual equality and renewal; after 1740, native Christian preachers and teachers like Samuel Ashbow at Mashantucket and Edward Nedson at Stonington became Pequot leaders. At Mashantucket, the embrace by some of evangelical Christianity, along with long-standing political conflict over tribal leadership resulted in the formation of separate "conservative" and "reform" groups. The latter established a nuclear settlement, Indiantown, with about twenty-five families, who increased their use of animal husbandry and began to build farms and framed houses. The remaining "conservative" Pequots, about fifty, continued to live on small, scattered homesteads, in very small framed houses or traditional wigwams, without farm implements or fencing.

In total, about 200 western Pequots remained at Mashantucket by the middle of the century, whereas the smaller eastern band retained only about forty members, mostly women. In March 1773, reformers from the two Pequot bands, along with five other southern New England tribes—Narragansett, Montauk, Niantic, Farmington, and Mohegan—made plans to create a new Christian Native American community, Brothertown, among the Oneida of New York, far from their shrinking homelands. Indiantown was abandoned by 1795, suggesting that its residents were part of this Brothertown movement. By the end of the century, the two Pequot groups were approximately about the same size, each comprising about fifty residents.

Philadelphia

Beginning in 1774, Philadelphia hosted the First Continental Congress and two years later witnessed the signing of the Declaration of Independence in the Pennsylvania State House. More than a decade later, American statesmen gathered in the same city to draft the Constitution. In short, no city performed a greater role in giving birth to the United States of America. As the largest, most diverse, and most economically vibrant entrepôt in North America, Philadelphia could rightfully claim to be the metropolis of the British American colonies and of the new American nation.

William Penn conceived of Philadelphia as a commercial and administrative center for his new colony, which had been awarded a charter in 1681 by King Charles II as a partial payment for a debt owed by the Crown to Penn's father. Penn pledged to give city lots in Philadelphia to the first group of investors in proportion to the total amount of land they purchased in the country. This generosity was intended as an incentive for settlers to sign on to Penn's project in the early phases of planning. Penn, as the chief proprietor, elected to name the city Philadelphia, or City of Brotherly Love, in light of his vision of the colony as a haven of toleration for religious dissenters. Penn's coreligionists in the Religious Society of Friends, also known as the Quakers, formed a large contingent of the First Purchasers of Pennsylvania land, and Philadelphia became home to a wealthy cadre of Quaker merchants.

Unlike most colonial towns, Philadelphia began with a blueprint, with William Penn and other planners as architects. Part of their design for the city, wedged between the Delaware and Schuylkill Rivers, included city blocks arranged in a grid, four major public squares, and a central square for the city hall. Penn instructed his planners to include space in house lots for "Gardens or Orchards or fields, that it may be a greene Country towne." Settlement proceeded, though not without controversy, as Penn and his First Purchasers squabbled for years over the assignment of town lots. Nevertheless, on the eve of the Enlightenment, Penn's design became a model of urban planning for the English-speaking world.

By the time Philadelphia received its first charter of incorporation in 1701, reports held that nearly 7,000 people resided in the city and its adjacent suburbs—a number historians believe to be too large. More reliable figures exist for later periods. Historians place Philadelphia's population just prior to the Revolution at 24,000, and nearly three times that by 1800. This rapid growth made Philadelphia the largest city in the early republic. As a consequence of this dynamic growth, Philadelphia was wracked by political struggles throughout its early history. Penn's decisions as proprietor triggered factional disputes between those supportive of his policies and those opposed to them. Quakers and Church of England adherents disputed matters of religion, as well as the distribution of political offices, which seemed to favor wealthy Quaker merchants.

The most politically influential group of Philadelphians were wealthy merchants like Isaac Norris, Jonathan Dickinson, and Edward Shippen, who had built great commercial empires by the 1720s and left their imprint on the city's social and cultural life. Their wealth enabled them to live far above the standard of most urban laborers, in affluent districts like Society Hill, and their lifestyle expanded to include lavish mansions, expensive imported furniture, decorative arts, and many other cultural refinements associated with the English landed and mercantile elite. The economy the merchants helped to build enticed thousands of immigrants to the Delaware River Valley region, and by 1776 Philadelphia hummed with activity. Artisans, laborers, shopkeepers from a variety of ethnic backgrounds, and a sizable free black community contributed to the diverse makeup of the city and began to make their presence felt

in civic affairs.

The Old State House in Philadelphia was built in 1735, by which time the municipal population exceeded 10,000. By the 1750s, Philadelphia had become the largest city and leading economic center in the North American colonies. (Brown Brothers, Sterling, Pennsylvania)

By midcentury, Philadelphia served as a major hub of institutional governance and social reform in the colonies, which encouraged and channeled new forms of political and social activism. Philadelphia hosted the Philadelphia Yearly Meeting of the Society of Friends beginning in 1681, which was the largest and most influential of the yearly meetings in the colonies. Philadelphia also served as home of Christ Church, one of the largest of the Church of England congregations in British North America, which played a strategic role in forming the national Protestant Episcopal Church following the American Revolution. Presbyterians could also conceive of Philadelphia as the center of gravity for colonial Presbyterianism, as the first presbytery, synod, and General Assembly were all held in the city. Thus, Philadelphia served as the epicenter of religious development in early America, as the religious organizations of the Old World entered the colonies and became formal religious denominations.

The religious diversity and vitality of Philadelphia helped to stimulate two of the largest social and cultural movements of pre-Revolutionary America, evangelicalism and abolitionism. When William Tennent, Sr., founded the "Log College" for ministerial training near Philadelphia, he initiated a sequence of events that led to the schism of Presbyterianism into "Old Sides" and "New Sides," fueled by the appearance of the English revivalist George Whitefield in Philadelphia in 1739. New Side Presbyterianism contributed to the development of evangelicalism, which historians of religion describe as a strain of Protestantism that stresses the importance of conversion experiences, personal piety, and the authority of the Bible. In another vein, Quakers at the 1754 Philadelphia Yearly Meeting were the first at a yearly meeting to officially denounce slavery. The Quakers also provided many of the leaders of the colonial abolitionist movement, including John Woolman and Anthony Benezet.

Benezet helped to organize the first antislavery society in colonial America in 1775, enlisting the help of such luminaries as Benjamin Franklin and Benjamin Rush. This impulse to reform society and improve humanity grew out of the peculiar dynamics of Philadelphia urban life. As a principal hub of commercial activity, Philadelphia was situated at a crossroads on the North American seaboard for the circulation of people, goods, and ideas around the Atlantic rim, including Western Europe, Great Britain, West Africa, the Caribbean, and elsewhere.

Men like Benjamin Franklin, a printer and newspaper publisher, helped to connect Philadelphia with the main currents of Enlightenment thought. Franklin helped to form the first scientific organization in America, the American Philosophical Society, in 1743, and his subsequent research on optics and electricity placed Philadelphia among a select group of eighteenth-century cities that were transforming the landscape of human knowledge. In 1751, Franklin helped to organize the first university in America, Philadelphia's University of Pennsylvania, which prefigured other Philadelphia "firsts" in the fields of science and medicine, including the first major hospital (1755) and first American medical college (1765).

Clearly, Philadelphia was at the forefront of major social, religious, intellectual, cultural, and political change in pre-Revolutionary America. Thus, it served as an unofficial "capital" of the colonies before the War for Independence. As such, it was the natural choice for the meeting of the First Continental Congress, formed in 1775 to discuss and respond to the British government's decision to close Boston Harbor and alter the Massachusetts Bay Colony's charter following the Boston Tea Party.

In early 1776, a Philadelphia printer published Thomas Paine's *Common Sense*, which made the case for independence and swelled the ranks of Americans calling for a constitutional separation from Great Britain. The Continental Congress approved this measure on July 2, 1776 and, two days later, accepted Thomas Jefferson's Declaration of Independence, which was written at his rented house at Seventh and Market Streets. During the War for Independence, Philadelphia had strategic value for both the defending American forces and their British foes. General William Howe dislodged the Congress from its seat at Philadelphia in 1777, which he hoped would divide the colonies at their economic and administrative linchpin. General George Washington understood the value of Philadelphia to the patriot cause and engaged the British army at several points in the Philadelphia environs.

Encamped at Valley Forge near Philadelphia during the winter of 1777–1778, Washington transformed his band of citizen soldiers into a disciplined fighting force and demonstrated its capability in the Battle of Monmouth in New Jersey. From this point on, the British military had to contend with a much more determined, more motivated, and more effective American army.

After the Revolution, Philadelphia retained its status as the center of intellectual and political life for the new nation, but only for a generation. Soon, the nation's capital would move to New York City and then to a new federal district on the Potomac River in Maryland. New York City would also overtake Philadelphia as the largest city in the United States in the 1810 census.

Nevertheless, Philadelphia played a large role in shaping American culture in such diverse areas as the decorative arts, painting, literature, industrial technology, and medical research. It also built institutions that became national models in the fields of mental health, criminal rehabilitation, and poor relief. As the nation's leading city in its formative period, Philadelphia was witness to and helped to shape the important political, intellectual, and cultural developments that gave birth to the United States of America.

Philip, King (Metacom; c. 1638–1676)

Born circa 1638, Metacom (later King Philip) was the second of three sons of Massasoit, the chief sachem of the Wampanoag tribes. He grew up in a rapidly changing world in which the careful peace engineered by Massasoit with the English colonists in Plymouth was fraying in the face of English expansion and the cultural strains that came with the introduction of Christian missions to the native population.

Massasoit, sachem of tribes that had been weakened by European diseases and warfare with the more powerful Narragansett, accepted nominal submission to Plymouth in order to gain the colonists' power against his regional rivals and access to European goods. Unfortunately, as Plymouth grew more established and powerful, its inhabitants no longer saw nominal submission as sufficient. And the Wampanoag, with little but land to barter for money and trade goods, had already lost much of their best hunting and agricultural land.

When Massasoit died in 1660, his eldest son Wamsutta became chief sachem and commemorated the occasion by asking the Plymouth General Court to choose European names for himself and his younger brother. The settlers chose Alexander for Wamsutta and Philip for Metacom, names they used for the rest of their lives, usually with the titles "Prince" or "King" as a European courtesy.

Alexander was sachem for only two years, dying in 1662 after a visit to Josiah Winslow. His death was probably from a fever he had contracted during his visit, although Philip, Alexander's wife, and many Wampanoags believed that he had been poisoned. Philip, the new sachem, vowed to revenge his brother.

Philip was a gifted leader, using the traditional role of the sachem to forge alliances among the Wampanoag, as well as with regional rivals. Many of these connections were made through his family, including the marriages of Philip's sisters and his own marriage to Wootonekanuske, a sister of Alexander's powerful wife, the female sachem Weetamoo of the Pocasset. Through these ties, Philip continued to keep the peace, despite the expansion of Rhode Island and Plymouth into Philip's own base of power, Mount Hope (later Bristol, Rhode Island), and accelerating conflict over native access via easements to the land they had sold colonists.

In 1671, after learning that Philip had been entertaining regional tribal leaders, perhaps with a view to taking action against Plymouth, the colony demanded that he sign another treaty, acknowledging total sovereignty of the English, including the English king and English laws. Philip had no choice but to sign, since Massachusetts, Rhode Island, and Connecticut backed Plymouth and refused to intercede. This humiliation undermined Philip's authority with the Wampanoag. His position was further weakened when his friend and secretary, an English-raised, "praying Indian" named John Sassamon, left Philip's service after a disagreement to serve as the minister to a missionary settlement.

In December 1674, soon after visiting Philip at Nemasket, Sassamon was found dead of unknown causes under the ice of Assawompsett Pond. Earlier

that fall, Sassamon had tried to convince Josiah Winslow that the Wampanoag were threatening the colony, but he had been brushed off. His death spurred suspicions of murder at the hands of three of Philip's entourage. On March 1, three Wampanoag, including Philip's councilor Tobias, were indicted for the murder and tried by the Plymouth General Court, which demanded jurisdiction as Sassamon was a Christian and all were under English law. Philip appeared voluntarily to deny any involvement, and the prosecution relied on a single native witness.

A jury of twelve Englishmen and a separate consulting jury of six Christian Native Americans found all three guilty, and they were executed over Philip's protests in June 1675. It is unknown if Philip had a hand in the murder, if his men took matters into their own hands, or if there had been a murder at all.

In the aftermath of the trial, a group of young Wampanoag men raided the settlement at Swansea after refusing Philip's plea for arbitration of outstanding land issues and legal jurisdiction problems. This raid triggered what became known as King Philip's War. Philip probably never led his men directly in battle because of a badly scarred hand injured by an exploding gun in childhood, but he directed their retreat to and escape from the Pocasset swamp. His solid tactical thinking saved his people at Nipsachuck Hill, again through an unexpected retreat. Badly diminished by disease, the Wampanoag took refuge in New York until evicted by Governor Edmund Andros in March 1676.

Philip sadly returned to Mount Hope, where a Plymouth force led by Benjamin Church captured his wife and son. In a subsequent attack on the encampment on August 12, 1676, one of Church's men, a Pocasset named Alderman, shot and killed Philip. The body of the sachem was decapitated and quartered before being sent to Plymouth, where his body was left unburied in the local woods and his head remained on display for twenty years. Philip's wife and son were sold into slavery in the West Indies, where they both died.

Philip II (1527–1598)

King of Spain (1555–1598) and King Consort of England (1554–1558), Philip II was born in May 1527. The son of Holy Roman Emperor Charles V and Isabella of Portugal, Philip was raised to rule the Habsburg family's vast domains in Europe and the New World. From his earliest childhood, he was educated for kingship and prepared to assume control of the largest empire in the world, serving several times as his father's regent in Spain and touring the Netherlands and Italy.

Philip's first two marriages, to his cousins Maria of Portugal (1543–1544) and Mary I of England (1554–1558) were meant to establish Spain as the leading Catholic power in Europe and assure its position on the Atlantic coast. In 1555, on Charles V's retirement, Philip II inherited Spain, Naples, the Netherlands, and Spain's overseas empire, while the Austrian branch of the family inherited the Holy Roman Empire.

A hands-on administrator, Philip II improved Spanish bureaucracy by centralizing it in a permanent capital, Madrid, and in his palace complex at El Escorial, and by appointing capable and efficient men, like Francisco de Toledo, to positions of power in the Americas. Fascinated by his empire, Philip II took great interest in native cultures, preserving Aztec and Mayan art and manuscripts in his archives, supporting ethnographic and botanical studies, and ordering a geographic and cultural survey, known as the "Forty-Nine Questions," beginning in 1576. Unfortunately, Philip II's propensity for micromanaging, combined with slow communications with the empire, hampered innovation or initiative on the part of his viceregents and his Council of the Indies in Madrid. On his personal orders, Spanish explorers claimed Florida in 1564 and the Philippine Islands in 1570.

The enormous wealth of the Spanish Empire, with one-fifth paid directly to the king, made Philip II immensely powerful in Europe and financed his commitments to the rest of his lands. Throughout his reign, Philip II juggled threats on all sides. He led a coalition against the Ottoman Empire in the Mediterranean, put down the Morisco Revolt within Spain in 1568, and, in 1580, engineered the dynastic takeover of Portugal on the death of King Sebastian. His most draining campaigns centered on the Protestant-led revolt of the Netherlands, which turned into a grueling guerilla war lasting into the reigns of Philip's son and grandson.

A pious Catholic, Philip II felt compelled to impose orthodoxy on his own realms, going to great expense and suffering personal unpopularity because of his support for the Inquisition. He also used his special authority to appoint bishops and missionaries in order to support reformers like Bartolomeo de las Casas, who argued for the humane treatment of Mexicans, and favored St. Teresa of Avila's Carmelite reforms.

Philip II's last two marriages, in 1559 to Elizabeth of Valois (who died in 1568) and Anna of Austria in 1570 (she died ten years later), were arranged in an attempt to hold together his European authority in the face of increasing difficulty. Spain's huge spending on defense and suppression of the Dutch

Rebellion led by William of Orange pushed the Crown toward bankruptcy—a precarious situation made worse by the lack of a state bank and the inflation caused by the influx of gold and silver from America. Philip II, as instigator and financier of the Catholic League led by the Guise brothers, involved Spain in the bloody Wars of Religion in France. In 1588, he launched the Spanish Armada in a failed attempt to unseat Elizabeth I of England, his former sister-in-law.

Even the Ottoman Empire continued to loom, having recovered quickly from Philip II's naval triumph at Lepanto in 1571. Precious convoys of wealth from China, South America, and Mexico were constantly menaced and taken by such English privateers as Francis Drake, adding to Spanish financial instability. Realizing the already unwieldy nature of his empire and the dangers of over expansion, Philip II issued the 1573 Ordinance on Discovery and Populations, banning additional conquests. By the 1580s, he also had abandoned large-scale development of Florida.

Although a brilliant and pragmatic monarch, Philip II left behind a structure of government, infrastructure, and empire that seriously handicapped Spain in the sixteenth century and initiated a period of decline in comparison with England and France. Philip II died on September 13, 1598, at the Escorial and was buried as a Franciscan monk. He was succeeded by his only surviving son (by Anna of Austria), Philip III.

Piedmont

Conceived in the broadest possible geographic terms, the Piedmont region extends from the Hudson River Valley in New York to central Alabama and comprises the foothills of the Appalachians. As it relates to American history before 1776, however, people usually define the Piedmont as consisting of the combined backcountry of the colonies of South Carolina, North Carolina, and Virginia. In fact, this Piedmont region served as a sort of laboratory of colonization, in which English planters, diverse native communities, African and African American slaves, and non-English European immigrants (mainly the Scots-Irish) lived in close proximity and often came into conflict.

Native settlement in the Piedmont had occurred by 10,000 b.c.e. On the eve of European colonization, several paramount chiefdoms in the Mississippian tradition had risen and fallen, leaving smaller, autonomous tribes in their wake. These were the predecessors of colonial-period communities like the Catawba, Monacan, Tuscarora, and Cherokee. Most native groups practiced corn and squash agriculture in addition to hunting, fishing, and foraging for wild food. In many cases, agriculture provided for settlement in large villages.

Although the Spanish under Hernando de Soto brought a fair amount of death and destruction to the Piedmont's inhabitants, they did not establish permanent settlements in the region. But in the late seventeenth and eighteenth centuries, immigrants from English colonies did just that, with disastrous effects on the region's native peoples. By the time of the War for Independence, many native groups had been dispossessed or weakened by disease. The presence of expanding English colonies, first in Virginia and later in the Carolinas, exerted new pressures on the area's native groups.

Although some English planters moved from the Atlantic coast into the Piedmont region, many chose to remain in what they considered to be more "civilized" areas surrounding Charles Town and Williamsburg. This reluctance, combined with the fact that river-based travel was difficult in the Piedmont, prevented the development of large towns in the region for much of the eighteenth century.

Migration to the backcountry or Piedmont occurred in two streams. In Virginia, larger landholdings were more common, as were African slaves and tobacco plantations, spurred on by the colony's more extensive network of navigable rivers. A new generation of Virginia planters grew to prominence in the Piedmont.

Farther to the south, the Carolina backcountry was also populated by some immigrants from the East, but a large number of Scots-Irish and Germans descended into the region, following what was known as the Great Wagon Road. Their landholdings were often smaller than those in Virginia, and these yeoman farmers tended to focus on livestock and cereal grain agriculture. While nonnative settlement remained minuscule in the Piedmont, the area's population exploded in the middle of the eighteenth century.

The population increase in the backcountry sometimes spurred conflict with older, more established areas. The conflict between eastern and western Virginia was more subdued. Bacon's Rebellion of 1676 had some of these trappings, but it was more about patronage than political representation; in any event, Bacon's own plantation was not really in the Piedmont region.

South Carolina and North Carolina's Piedmont regions both were the sites of violent Regulator movements in the 1760s. Frustrated by their lack of representation in the colonial legislatures and the dearth of courts and public officials, backcountry residents took the law into their own hands in what has been viewed in some instances as vigilantism and in others as effective political protest. One prominent scholar has shown that the people ordering the violence were planters trying to bring order to the backcountry, not just a disorganized mob.

The War for Independence brought more violence to the Piedmont region. Supporters and opponents of the actions of the Continental Congress waged what amounted to a civil war against each other—in some instances, burning each other's homes and property. Additionally, British and American forces moved back and forth across the region, particularly in the war's later stages leading up to the surrender of Lord Cornwallis at Yorktown.

Although the Piedmont was an important region in colonial America, it would really come into its own after the War for Independence. Cotton agriculture would spread through the region in the late eighteenth and early nineteenth centuries.

Pietism

More a way of believing than an organized religious movement, Pietism originated in seventeenth-century Germany.

In the century after Luther had begun the Protestant Reformation, intellectual disputes splintered the church. In the German states, the Reformation brought on the Thirty Years War, which ended with the nation in ruins. A Lutheran minister, Philipp Jakob Spener, wanted to comfort the people by emphasizing the mystical side of Luther's teachings, the need for a personal Christian experience, and a new birth.

The mystical element had roots in both Roman Catholicism and the Anabaptist movement. The idea of a personal relationship with God came from the Anabaptist belief that God offers the "inner light" of the Holy Spirit as the guide to salvation. Anabaptists, who suffered persecution for their beliefs, disdained excessive dependence on the written word, and their inner light sometimes led them to millennialism.

Spener wanted Christians to follow their faith with their hearts rather than dispute it with their minds, but he was not a millennialist. The pietism he envisioned incorporated lay ministries, small-group Bible studies, individual lives devoted to prayer and the study of the Bible, right living, a "heart-felt" faith, and a "new birth." Pietists were a priesthood of the true believers, with no need for a formally educated and separate priesthood. Even though they rejected a trained priesthood, they did not reject education in itself. Rather, they shifted theological education's emphasis away from analysis, interpretation, and explication toward a more practical and personal education that enhanced the personal, internal, religious experience.

Spener also called for a change from attacking nonbelievers and the heterodox to practicing a sympathetic and kind approach. In addition, he felt that preaching had to sacrifice pleasing rhetoric if that was what it took to convey to the new Christian what faith meant and how it was revealed in Christian life.

Pietism worked well with most other traditions. Spener was a Lutheran, English Puritans incorporated Pietism into their Calvinism, and John Wesley used Pietist emphases from the Moravians in his Methodism. English Independents and Quakers were of the Anabaptist Pietist tradition, as were the German Mennonites and the Amish. Latter-day Hussites, the German Brethren and Moravians, also immigrated to the Middle colonies.

Pietism was perhaps as vital as Calvinism in American Protestantism. For instance, Cotton Mather had Pietist tendencies. Pietism was as important as Puritanism to Jonathan Edwards, who emphasized that the indwelling of the Holy Spirit would manifest itself in outward signs in a true Christian. Staring in 1749, the Great Awakening was to a good extent a Pietist revival movement. Its most prominent preacher, perhaps the most inspiring revivalist of all time, George Whitefield, also displayed Pietist leanings.

Pietists who had personal experiences of Jesus Christ had an urge to share that relationship with others, and that urge often became a commitment to evangelism. Count Leopold von Zinzendorf founded the Moravian Missionary Society in Germany, which sent hundreds of missionaries to America. Several colonies were actually founded on Pietist principles. The Baptist Roger Williams founded Rhode Island; Quakers George Fox and William Penn founded New Jersey and Pennsylvania.

Pietists could be within or outside the church. Churchly Pietists include the Lutheran Henry Melchoir Muhlenberg, while the separatists include the Moravian Count Zinzendorf, Johann Conrad Beissel of the Ephrata Cloisters, Johann Kelpius who came from a Philadelphia religious community; and

Ernst Christian Hochman von Hohenua of the Brethren.

Pietists also influenced Universalists such as Dr. George de Benneville, who gathered the believers in his Olay, Pennsylvania, house church. Other Universalist leaders came from Methodist or Baptist Pietism. Pietism reached into the hills and rural areas of New England due to the revivalism of Caleb Rich, Isaac Davis, and Adams Streater.

The Pietist “inward turn” was integral to the individualism that characterized America. The inward turn also influenced the transcendentalist writers Ralph Waldo Emerson and Henry David Thoreau. It brought respectability to emotion, in contrast to the emphasis on intellect and rationality that had characterized the philosophies of such Enlightenment revolutionaries and deists as Benjamin Franklin and Thomas Jefferson.

Pietism was vital to the Baptists and Presbyterians after the Second Great Awakening. The early national period saw a revival of the Great Awakening that had slumbered through the Revolution’s dominant enlightenment thinking. The old Pietist impulse reemerged as inner commitment, bearing fruit in outward expression—abolitionism, educational reform, women’s suffrage—and all efforts to bring society more in line with the Christian values given to each individual through a personal experience of God.

Pilgrims

Perhaps no group of Early American colonists is as widely known—and as misunderstood—as the Pilgrims. While most American schoolchildren can tell the basic story of these settlers, their story often has been oversimplified into an inaccurate myth. The motivations, experiences, and legacy of the Pilgrims extend well beyond the tradition of Thanksgiving Day.

Pilgrims in England and the Netherlands

The Pilgrims traced their roots to Puritan England of the late 1500s. Puritans had traditionally dissented from the theology and control of the Church of England, believing that the Church's practices needed to be reformed and “purified.”

By the turn of the seventeenth century, a particularly devout group of Puritans became convinced that the Church of England was so corrupt that its ills would infect even those righteous members who remained within the fold. These believers despaired of reforming the Church from within. In 1604, at Scrooby, England, they declared themselves “the Lord’s free people.” Withdrawal from the Church of England, these Scrooby Pilgrims believed, would allow them both to remain unblemished in the sight of God and to work for the Church’s reform and salvation.

Nonseparating Puritans condemned their separatist Pilgrim brethren, considering their actions heresy. As a result, the new separatists found themselves theologically and physically persecuted to an astounding degree. By 1607, their afflictions had become so great that the Scrooby Pilgrims fled to the Netherlands for sanctuary.

As the Pilgrims settled into their new home, they eventually formed a comfortable and even prosperous community in and around the town of Leyden. The Netherlands of the seventeenth century was a region where commerce, trade, finance, and education were all thriving pursuits; accordingly, it attracted immigrants from across Europe. The atmosphere of tolerance that prevailed was no doubt attributable to the healthy economy, the abundance of educated citizens, and the frequent contact between native Dutch and immigrants, as well as among the immigrant groups themselves. Certainly such a culture must have seemed refreshing and welcoming to the former “heretics” from England.

Most of the Pilgrims took full advantage of the absence of persecution that had been their lot in their homeland, and they became widely engaged in business, academia, and social affairs in Leyden. Some Pilgrims were employed in shops, banks, or in other phases of commerce. A few took the opportunity to become students or professors. And a number of Pilgrims engaged in the local textile industry, becoming weavers and sellers of cloth.

Word of the group's success and peaceful existence spread and attracted a steady stream of Pilgrims from England. Still, there was a growing sense among the Pilgrims that they were becoming "too Dutch" and losing their identity as Englishmen. Some also worried that material success was dimming the spiritual mission that had originally driven the group from their homeland.

The Pilgrims' past experience made it clear that returning to their homeland was not an option. Instead, in July 1620, a group of Leyden Pilgrims left on the ship *Speedwell* for England to complete negotiations with the Virginia Company. By September 16, they were joined by English Pilgrims and set sail on the *Mayflower*, bound for the New World.

Pilgrims in the New World

The Pilgrims' arrival in North America was not an auspicious beginning. Although they survived the long and difficult journey with one more Pilgrim than had left England (one adult had died, but two babies were born on the voyage), the *Mayflower* landed, not in Virginia territory, but far to the north, on Cape Cod in Massachusetts.

The group immediately realized that their location left them without legal authority from the king to settle in the New World. Nevertheless, they decided to remain where they had landed; after a brief, month-long sojourn at the tip of Cape Cod, they established a settlement at Plymouth, Massachusetts. The founders of this new settlement signed the Mayflower Compact to create a framework for self-governance.

The first winter at Plymouth was a harsh one, leaving over half the new colonists dead by the spring of 1621. Soon, however, local Native Americans came to the settlement's rescue. Samoset and Squanto, who both spoke some English, aided the Pilgrims by teaching them how to plant corn, showing them productive fishing and hunting areas, and pointing out edible plants. These two protectors also helped the Pilgrims establish a good relationship with the Wampanoag chief Massasoit, in whose territory the group had settled. By the fall of 1621, the settlers were sufficiently established in their new land to observe a day of thanksgiving. That observance has come to be an American tradition.

The 90-foot, 180-ton Mayflower, a converted merchant ship, had been used in the French wine trade before being chartered for the Pilgrims' 1620 voyage to America. This model is housed at the Science Museum in London. (Science Museum, London, United Kingdom/Bridgeman Art Library)

Most of the Pilgrims who came on the *Mayflower* were of lower- or middle-class economic backgrounds. Elder William Brewster served as the group's preacher, but the fact that he was a layman, not a minister, prevented him from administering the sacraments. An Anglican priest had been sent to Plymouth in the early 1620s, but he was soon dismissed because his theology was found unacceptable.

Even in the absence of a pastoral leader or a formal church, the Pilgrims seem to have remained remarkably observant in their religious faith. By most accounts, Pilgrims in America were content with daily piety rather than seeking to break new theological ground. Their relief from persecution because of their religious beliefs, along with this everyday religiosity, allowed them to pursue the ideals of the Mayflower Compact in creating "a body politick" based on mutual respect and the pursuit of the common good.

Perhaps because of their reputation as heretics and dissenters, the Pilgrims never attracted large numbers of immigrants to their new home in Plymouth Colony.

Daily Life of American Pilgrims

While it is easy to romanticize the Pilgrims' life as one that mirrors our legends of that first Thanksgiving, it is important to remember that these settlers were strangers in a strange and unsettled land. Hard work, homesickness, and fear were ongoing features of life for the Pilgrims.

When the first Pilgrims and those who followed them arrived in the New World, they came to a land that was heavily forested and all but unknown to white Europeans. As with any groups setting out to frontier areas, the Pilgrims faced the immediate necessity of establishing shelter from the elements, from wild animals, and from potentially hostile natives. Land had to be scouted to determine its fitness as a site for settlement; once a tract was chosen, the timber had to be cleared away and the ground leveled to create a suitable building site. Driven both by the impending winter and the scarcity of tools, the earliest Pilgrims built small huts and houses from the trees felled in clearing the area. Later settlers may have enjoyed more time for their task, but the difficulty and danger of raising massive beamed roofs and other components was still formidable.

In conjunction with the building of dwellings, the settlers had to quickly determine means by which they could supply themselves with food. Although some food had been brought over from England, the necessity of becoming self-sufficient was immediately evident. The Pilgrims had to scout out good fishing and hunting areas and to learn over time what crops could be grown in this new and unfamiliar land. In addition, the differences in plant life between the New World and the Old made it necessary for settlers to learn which plants could or could not be safely eaten.

Everyone—men, women, and children—worked long and hard in the settlement at Plymouth. Many historians have pointed to the value of their Puritan faith for these Pilgrims. Without a sense of divine assistance and the righteousness of their enterprise, the difficult circumstances of life in North America would likely have been unbearable. Religious observances such as days of fasting and prayer, along with regular preaching and church meetings, must have played an essential part in maintaining the Pilgrims' emotional and mental strength for the harshness of the life that confronted them daily. Still, it seems logical that they also must have experienced homesickness for family members and for the ways of life that had been left behind in England and the Netherlands.

William Bradford

By far the most widely remembered Pilgrim is William Bradford. Attracted to the Scrooby Pilgrims as a young Englishman, Bradford went first to Amsterdam and, later, to Leyden with them in the early 1600s.

His father having died before Bradford was a year old, he was trained by his uncles to be a farmer. Still, his natural curiosity went beyond matters of crop planting and animal husbandry, and his was an intelligent and inquiring mind. In addition to becoming relatively prosperous as a weaver in Leyden, Bradford took the opportunity to read and educate himself. When the *Mayflower* set sail in 1620, he was one of the leaders who had helped plan the voyage and negotiate with English businessmen to arrange financial backing for the trip and settlement.

For many historians, William Bradford has come to personify the Plymouth colony. A devout Separatist, he also took his place in colonial civil affairs, winning election as the colony's governor a total of thirty times.

Bradford's legacy is also that of his massive volume *Of Plymouth Plantation*. Written between 1630 and 1647, this book discusses virtually every aspect of life in the Pilgrim settlement and colony, from the styles of dress and descriptions of housing to relations with the Native Americans; from matters of theology to descriptions of local plants and animals; and from character sketches of local personalities to discussions of weather and crops. *Of Plymouth Plantation* remains an invaluable source of information on this early period of colonial life, and most historians point to it as the definitive record of the Pilgrim experience in North America.

Piracy

The early colonial period in American history witnessed the “golden age” of piracy. In the mid-sixteenth century, England, the Netherlands, and France were struggling to overtake Spain and Portugal in the race for trade and empire. These challenger nations, by the licensing of entrepreneurs, through state sponsorship, or simply by turning a blind eye to pillage, let privateer and pirate ships sail free.

In the seventeenth century, piracy was, for the most part, conducted in the Caribbean basin, where the primary targets were the rich Spanish galleons laden with gold and silver from the Mexican and South American mainland. The men, and occasionally women, who perpetrated these raids, at times with the blessing of their national governments, were English, French, and Dutch as well as sometimes renegade Spanish, Portuguese, and African pirates, who took part in the predations at sea.

The pirates of the seventeenth century operating out of the Caribbean basin were called buccaneers, so named from the French *boucan*, which means to roast or dry meat over an open fire, since these men hunted and feasted on the feral cattle and pigs that roamed the sparsely inhabited Caribbean isles. Since the early 1600s, the European states had a policy on the seas of “no peace beyond the lines,” which meant that while trade was for the most part carried out peaceably in European waters, all ships outside these lines of amity were fair game. Thus, the bellicose tradition of mixing trade and plunder was applied in the Atlantic and Caribbean regions.

By the end of the seventeenth century, several types of piracy were in existence: officially sanctioned piracy (privateering), commercial piracy, and marauding. These were not mutually exclusive and the career of any given pirate could encompass all three categories. During wartime, European nations issued official commissions, or letters of marque, to individual mariners and ships in support of marauding missions. In times of peace, the commissions were called letters of reprisal, which allowed an aggrieved subject of the prince to steal from those subjects who had stolen from him on prior occasions. Since there were not as yet any formal methods of insurance in place, letters of reprisal were a crude way of compensating for losses at sea and provided many opportunities for abuse. They also illustrate the weak institutional structure of international relations at the time.

Commercial piracy was fostered by local merchant communities that were suffering from an unfavorable balance of trade and a lack of hard currency. Colonial merchants, often with the support of the local government, sponsored pirate voyages in addition to offering buccaneers sanctuary and trading opportunities. While in port, the pirates exchanged goods, spent their booty at the local taverns and inns, repaired and re-equipped their ships, and purchased services of all kinds before heading back out to sea. In return, the townspeople acquired various cargoes, mostly Spanish commodities, as well as prized “pieces of eight” and other forms of cash. In the Caribbean islands, Port Royal, Jamaica, was the first to earn a reputation as a pirate haven. At the turn of the century, the mainland ports of New York, Philadelphia, Boston, Newport, and Charles Town likewise became favored hubs of pirate activity.

The third form of piracy, marauding, not only took place along the Atlantic seaboard but also extended to the Pacific and Indian Oceans, thousands of miles from the American mainland, while the organized marauders maintained their bases of operation in the colonial ports noted above. In the Pacific region, these pirates pillaged Spanish ships making the Acapulco-to-Manila run, as well as raiding coastal towns. The most spectacular of these raids took place in 1671, when Henry Morgan and a group of predominantly English buccaneers sacked the Spanish port of Panama City.

Edward Teach, better known as Blackbeard, was an English pirate notorious for terrorizing ships in the West Indies and off the Carolina coast until his death in 1718. His treasure is said to be buried somewhere along the Eastern seaboard. (Library of Congress/Bridgeman Art Library)

The most famous Anglo-American pirate was William Kidd, who was tried and executed in London in 1701. Kidd was married to a wealthy New York widow and lived in a house on Wall Street for a number of years before turning pirate in the Indian Ocean. He had been legally commissioned in New York and London as a privateer and proclaimed his innocence until the end, but international politics involving the Indian Mughal, King William III, and the powerful East India Company conspired to cause his downfall. In addition to Kidd, there were a number of other infamous Anglo-American pirates, including Edward Teach, otherwise known as Blackbeard, who was killed in a battle off the Outer Banks of North Carolina in 1718.

As pirates grew more and more violent, thereby alienating previously sympathetic states, merchants, and ship owners, they were systematically hunted down and exterminated. The colonial governments continued to commission privateers to attack British shipping during the Revolutionary War.

Pitt, William (1708–1778)

William Pitt, British statesman, was educated at Eton and Oxford. Following four undistinguished years in the army, he entered Parliament, where he allied with the opponents of Prime Minister Sir Robert Walpole.

Pitt first entered American affairs following the War of Jenkins' Ear (1739–1743), a conflict with the Spanish in Georgia and the Mediterranean. In a mocking indictment of Walpole's humiliating peace treaty with the Spanish, Pitt called the agreement "a stipulation of national ignominy." His vociferous criticism propelled him through the ranks of the opposition and struck a chord with the public.

Pitt was kept from office only until 1745, when King George II was forced to appoint him paymaster of the forces to prevent the resignations of his ministers. After a decade of robust service, Pitt was dismissed in 1755 for disagreements with his political masters over the massive British war against France and her allies. It was at this juncture, at the age of 46, that Pitt married Lady Hester Grenville, with whom he had two daughters and three sons, including his namesake William, who later became prime minister.

As France grew stronger and British defeats became disturbingly more frequent, Pitt, whose calls for rearmament had been ignored during the previous years of peace, was eventually appointed secretary of state in 1756, or prime minister, and he immediately took command of the war effort. For the next four years, he pursued an ambitious, aggressive program of military campaigns designed to deprive France of all her colonial possessions and contain her in Europe. These campaigns, which in America became known as the French and Indian War, were truly global in scope, encompassing India, Europe, the West Indies, and North America.

In the American theater, Pitt concentrated resources on Louisbourg and Quebec, two fortified French settlements that guarded the St. Lawrence River. In July 1758, Louisbourg fell to a force of 14,000 regulars under General Jeffery Amherst, opening the St. Lawrence to the British navy and cutting off interior settlements from French reinforcement. Soon afterward, General Abercromby, using a mixed force of colonists and natives, captured Fort Duquesne, proudly renaming it Pittsburgh. After the fall of Quebec to General Wolfe in the spring of 1759, the remaining French outposts found themselves surrounded and the French governor of Canada soon surrendered. This collapse sealed British hegemony in North America, simultaneously uniting the European territories and opening the vast prairie lands to the west to English settlement.

During these years, news of British victories in theaters across the globe seemed to flood London. In 1759 alone, Pitt's *annus mirabilis*, British armies won critical engagements in Minden, Guadeloupe, Lagos, and Quiberon Bay. When George II died in 1760, his son inherited an empire that stretched from Canada to India. But the new king had little respect for Pitt's achievements and forced his resignation in 1761, filling the cabinet with his own favorites. Confined to the back benches, Pitt nevertheless spoke out against the Treaty of Paris, signed in 1763, which, he believed, offered too many concessions to the vanquished French.

Pitt never regained real power. Dogged by manic depression, which kept him confined to his home for months on end, his postwar career was a series of minor recoveries punctuated by long periods of absence and decline. But having fought so hard to secure North America, the rising crisis in that region always commanded his attention. In 1766, he publicly denounced the Stamp Act, a duty on commercial goods designed to pay for the cost of the recent war. While asserting Britain's claim to sovereignty over the colonies, Pitt argued that taxation should proceed only with colonial consent, as "Americans are the sons, not the bastards, of England."

After a brief return to the premiership in 1766, which was abruptly curtailed by illness, Pitt, now Lord Chatham, was forced to watch from the sidelines. But when, in 1774, the government proposed the closure of the port of Boston in response to the Boston Tea Party, Pitt boldly protested such excessive retribution and warned that unless friendly relations resumed soon, "we, not they, shall be undone."

In January 1775, Pitt offered his own solution to the current impasse. Arguing that the only way to rebuild trust was to remove fear and resentment from the bosoms of the colonists, he proposed the immediate removal of troops from Boston, the establishment of independent judges, and the introduction of trial by jury. He also recognized the colonies' right to consent to taxation and the utility of the Continental Congress as a political conduit. Despite support from several major figures in Parliament, this "Provisional Act" was defeated by sixty-eight votes to eighteen. Further proposals met similar fates.

The British statesman William Pitt, the elder, known as “the Great Commoner,” led his nation to preeminent status on the international scene. In the Western Hemisphere, he wrested control of Canada from the French and advocated conciliation with the American colonies. (Brown Brothers, Sterling, Pennsylvania)

The great statesman died on May 11, 1778, at the age of 70.

Plantations

A plantation can be defined as an organized system of agricultural production in which large amounts of land are brought under cultivation for the purpose of attaining economic gain. In most cases, plantation owners grow a single crop, commonly referred to as a “staple” or “cash” crop, which they then sell on both the local and global markets.

In colonial North America, plantation agriculture played a critical role in the economic, political, social, and cultural development of five Southern colonies—Maryland, Virginia, North Carolina, South Carolina, and Georgia—where plantation owners concentrated their efforts on the production of three main crops: rice, tobacco, and cotton. The type of crop a planter grew depended on local climate, soil conditions, available labor, and market conditions. Planters in Maryland, Virginia, and most of North Carolina grew tobacco, while those located on the coastal regions of South Carolina and Georgia grew rice. As more and more planters migrated inland, cotton production became increasingly important, especially in Georgia and the Carolinas.

The first plantations were located in Virginia. John Rolfe's introduction of tobacco to Virginia in 1613 and the creation of the "headright" system shortly thereafter led to a flood of newcomers to the colony. Under this new system, prospective landowners were promised 50 acres of land for every person whose passage to the New World they financed. The result, at least in part, was the emergence of a small group of wealthy planters who owned large tracts of land that were cultivated by a continuous stream of indentured servants.

The length of one's servitude was limited, however; by the mid-seventeenth century, agricultural production in Virginia was increasingly influenced by a burgeoning group of newly freed servants. Although a small group of wealthy planters continued to dominate Virginia society, most Southern planters were actually poor farmers, who owned approximately 100 acres of land each and lived in modest wooden houses. They had no servants or slaves, and their crops were usually laid out in haphazard fashion. This would all change by the beginning of the eighteenth century.

During the last half of the seventeenth century and the beginning of the eighteenth century, the influx of indentured servants to the colonies declined dramatically, while the importation of slaves from Africa increased. The amount of land under cultivation also increased. The founding of Maryland (1632), the Carolina colonies (1663), and Georgia (1732) greatly expanded the amount of land available for plantation agriculture and, in turn, generated a tremendous demand for laborers.

In an effort to shore up their position atop the social and political hierarchy and create a seemingly endless labor supply, Southern colonial leaders institutionalized a system of chattel slavery based on race, permanently altering plantation agriculture. By 1700, slave owners dominated Southern society.

Masters, Slaves, and Plantation Architecture

Slave owners' domination of Southern society permeated every aspect of plantation agriculture, including the layout and design of the plantation itself. By the mid-seventeenth century, wealthy planters began building very large, well-ordered plantations with carefully constructed homes and outbuildings that reflected their own tastes, values, and attitudes. Many wealthy slave owners modeled their plantations after English manorial estates, complete with formal gardens and extensive stretches of fenced, neatly cultivated land.

In many ways, a neat, well-ordered plantation became symbolic of a planter's dominance over nature and society. By maintaining a strict hierarchical order, slave owners were able to bolster their power and authority over a labor force that continually resisted domination. Over the course of the colonial period, the plantation became a site where complex social relations were played out on a daily basis and often were manifested in the physical appearance of the plantation.

Orton Plantation, built about 1725 on the Cape Fear River in coastal North Carolina, was a leading producer of rice. Plantation farming was vital to the development of Southern colonies. (Library of Congress, LC-G602-CT-[043])

The central focus of a large plantation was the master's home, commonly referred to as the Big House. Situated atop the highest land available to the planter, the Big House loomed over the other buildings and the outlying fields, and it was the center of activity for the master and his family. It was a showplace, where the master and his family displayed their wealth and power and entertained guests.

Situated on lower ground, either behind or beside the Big House, were quarters for those slaves who worked in and around the house. Slave quarters stood in neat rows and the individual buildings usually were nothing more than a single-room cottage with a chimney and a couple of small windows. Made of wood or stone, with tile or shingle roofs, some slave cottages also had a small front porch. Slave quarters for field hands generally were of the same type, but these were located farther away from the Big House, near the fields.

In between the slave quarters and the Big House was the yard. Elderly slaves and certain slave women and men—those who were pregnant, nursing,

injured, or disabled—performed most of the household chores in the yard. They used large cast-iron kettles and washtubs to make soap and do the wash. They also watched over slave children, who were kept in the yard while their parents worked the fields.

Surrounding the yard were numerous outbuildings, including the kitchen, poultry shed, dairy, smokehouse, icehouse, and various other storage sheds. As the eighteenth century progressed, it became increasingly common for plantation owners to build separate kitchens, not only to avoid unpleasant heat, odor, noise, and the danger of fire, but also to maintain a sense of physical space between the slaves and their masters.

Most plantation owners raised chickens, turkeys, ducks, geese, and pigeons, which they kept in small coops or "houses" located near the kitchen. Other meats, such as pork, were preserved and stored in a smokehouse. A large plantation usually cured and stored about 2 tons of pork each year. Hogs that were slaughtered, quartered, salted, and dried over a smoldering fire in autumn were butchered into usable cuts in spring.

Another important outbuilding was the icehouse. Evidence suggests that Virginia planters used icehouses as early as 1665. These tended to be located away from the other buildings and built at least partly underground, where temperatures remained cooler and more constant. During the winter months, planters would gather large chunks of ice and place them inside the icehouse, where they would then be packed in grass or sawdust. Ice stored in this manner tended to last most of the year.

Scattered throughout the plantation were other important outbuildings, such as craft shops, barns, and stables. In most cases, very large plantations had slaves who were skilled artisans—carpenters, coopers, blacksmiths, tanners, shoemakers, spinners, and distillers—who required their own shops.

Perhaps the most important items on the plantation were the equipment and buildings used to produce the crop. Tobacco plantations in Maryland, Virginia, and North Carolina used tobacco presses, while plantations located in coastal South Carolina and Georgia had winnowing houses. A tobacco press was nothing more than a screw-operated bolt set in a heavy wooden frame. Slaves inserted dried tobacco leaves into the press and turned the bolt to compress them. Most tobacco presses were large enough to accommodate a hogshead of tobacco, which was a barrel 4 feet tall and 2½ feet in diameter. A single hogshead held between 1,000 and 1,300 pounds of tobacco.

Winnowing houses, used in the production of rice, were slightly more complex. A winnowing house was a small, square room raised approximately 10 feet off the ground. After the rice was dried, threshed, and pounded, it was passed through a grate built into the floor of the winnowing house, which would filter out the grain. The process of pounding and winnowing was repeated until the rice was clean.

Plantation Work Rhythms

Plantation slaves generally worked from dawn until dusk and used the evening hours to meet their own needs and the needs of their kin. Slaves planted the labor-intensive crops in the spring, tended them throughout the summer, and harvested them in autumn. Slaves spent the winter months preparing for the next planting season and tending to the daily tasks necessary to maintain the plantation. Despite an extremely demanding work schedule and an often unaccommodating—and in some cases brutal—master, plantation slaves forged extensive kin networks and made time for religious worship, singing, storytelling, and other forms of cultural expression.

Masters spent their days organizing the work force; keeping an inventory of equipment, buildings, produce, and slaves; and acquiring the items necessary to keep the plantation running smoothly. They disciplined slaves, oversaw their medical treatment and their daily comings and goings, and, in some cases, chaperoned important social events such as, weddings, births, funerals, and religious services. The master's gaze was not omnipresent, however, and much of the slaves' daily lives—their relationships, celebrations, meetings, and numerous acts of resistance—went undetected. In addition to managing his workforce, the master also cared for his own family and entertained his guests.

Plantations and Southern Society

Although owners of modest plantations and poor farmers occupied much of the Southern landscape during the colonial era, the term "plantation," evokes the expansive holdings of a wealthy planter. By 1750, the notion that a plantation was a well-ordered, well-constructed country estate belonging to a wealthy gentleman was firmly entrenched in the popular culture. Such plantation owners, in turn, held a tremendous amount of social, economic, political, and cultural authority, but that authority was not absolute.

Slaves and poor and middling white planters continually challenged Southern society's ruling elite. Their unrest would lead, at least in part, to uprisings such as Bacon's Rebellion (Virginia, 1676) and the Stono Rebellion (South Carolina, 1739), as well as the emergence of the Regulators in North and South Carolina during the early eighteenth century.

Planters

The term “planters” usually refers to an Anglo-American landowner holding twenty or more slaves during the colonial and antebellum periods of American history. This definition should not be taken as hard and fast, however, since other murky categories such as “large landowners,” “great planters,” and “middling planters” cloud the picture. Before 1776, this elite social class was most relevant to the development of Southern colonies and the Caribbean, though some arguments could be made for the inclusion of the mid-Atlantic colonies.

Interestingly, because slavery did not exist in England or elsewhere in Great Britain, the category of “planter” seems to be unique to the New World. Planters from the Chesapeake, the lower South, and the Caribbean varied in their methods of pursuing wealth, but all relied on the labor of African slaves.

As the eighteenth century progressed, some planters, particularly in Virginia's tidewater region, became enamored with patriotic thought, which in part explains why they so fervently supported the movement toward independence. Planters also held a large percentage of colonial America's wealth and exerted a great deal of its political influence.

Birth of the Planter Class

Sugar plantations, worked by men and women in various conditions of servitude, had existed in the Mediterranean and off the coast of West Africa for some time before the English began to colonize the Americas. The earliest English experiences with plantation agriculture in the New World occurred in the Caribbean and in Virginia. Virginia, begun in 1607 as a trading venture, had failed miserably on that score.

In the decades that followed, Virginia's farmers had recognized the profitability of tobacco, which was coming into vogue in England in the first half of the seventeenth century. One should not take this fact to mean that a planter class appeared in Virginia overnight. Rather, as the seventeenth century progressed, the English gentry began to rely more heavily on slave labor and eventually placed themselves at the head of a racial caste system, with a large African labor force at the bottom. Drawing on examples from Ireland, the Mediterranean, and Portuguese and Spanish New World colonies, the English established plantations on Barbados as well, though these focused on sugar production.

Sugar, which was becoming increasingly popular in England, made Barbadian planters some of the richest men in the Americas. The first planters on Barbados intended to reproduce English institutions, including English common law, as faithfully as possible. By the second half of the seventeenth century, however, they had created a way of life totally centered on sugar production and its attendant African slavery. The planter class in Barbados, which in some ways was a model for later settlements, was relatively small in size, but what it lacked in numbers it made up in cohesion and power. Land was increasingly concentrated in their hands, and less well-off white farmers were slowly squeezed out of the islands.

The “planter class,” Anglo-American landholders and slave owners, were the social and economic elite of the Southern colonies and the Caribbean during the colonial and antebellum periods. (Yale Center for British Art, Paul Mellon Collection, New Haven, Connecticut/Bridgeman Art Library)

Within a matter of decades, the planters of Barbados, Jamaica, and the Leeward Islands had come to completely dominate Caribbean society, exceeding the role of the gentry in England. The English Caribbean planters gained a reputation for violence, excess, and moral profligacy. In fact, many planters on the islands managed their estates from abroad as absentees.

Late in the seventeenth century, a third planter class emerged in South Carolina's low country. The existence of a planter class hinged on the development of a single profitable staple crop. In the case of South Carolina, this crop was rice. South Carolina was a sort of middle ground between the planting classes of Virginia and Barbados. South Carolinian planters were richer than Virginia planters but their wealth paled in comparison to that of the West Indian elite.

American planters also positioned themselves at the head of a large, restive labor force, but the slave-to-master ratio was never as high in the South as it was in the Caribbean. And, unlike some planters in the islands, absenteeism was rare in colonial South Carolina rice plantations. Rice plantations were more profitable and less healthy than Chesapeake tobacco plantations, but less profitable and healthier than Caribbean sugar plantations.

Life as a Planter

As mentioned previously, some planters were more hands-on than others in their management of their plantations. This was particularly the case in the Chesapeake, where the quality of a man's tobacco was intimately tied to his status among fellow planters and even his masculinity. Virginia's leading planters prided themselves on the quality of their crops and often personally supervised the various stages of planting, cutting, and curing. Rice planters probably felt many of the same pressures.

Still, planters had more free time than anyone else in colonial America, and their lives reflected a level of luxury that was extraordinarily rare. The great planters in America did not have centuries of tradition supporting their claims to dominance, as did the English aristocracy. Rather, they had in the span of a few generations shoved their way to the top of colonial society. They found ways to express their power and social status, from building imposing frame houses and brick estates to educating their children in England and importing English luxuries, including carriages, clothing, and fine housewares.

Diaries like that of William Byrd II, one of Virginia's wealthiest men, give students of colonial history an extraordinary glimpse into the lives of planters. Byrd's secret diary reveals his passion for the finer things. Alongside entries detailing the intricacies of Virginia politics—in which Byrd was a major player—and the minutiae of running a large plantation, there appear references to wine and spirits, rich food, music, and sex. As the eighteenth century progressed, in fact, the concept of “refinement” became increasingly important, and planters strove not only to outclass their social inferiors but also to adopt sophisticated English styles ever more faithfully and rapidly. The widespread drinking of tea is just one example. Planters also engaged in a variety of leisure activities. The most popular in Virginia and South Carolina were cardplaying, horseracing, and cockfighting. Activities like these sometimes crossed class lines, though planters made the contests more exciting and aristocratic by wagering exorbitant sums.

In the Southern colonial legislatures, the wealthiest planters ran the show. They expected to be put into office by their social inferiors, and more often than not, they were. Southern planters viewed themselves as an aristocracy and believed that just as their families, smallholding neighbors, and slaves owed them deference and obedience, they had certain paternalistic obligations to those groups as well. The trend of returning the same small group of men to the legislature time and again continued through the era of the American Revolution.

Planting and Revolutionary Ideology

Planting a staple crop such as rice or tobacco on a large scale and living a comfortable, stylish life necessitated going into debt. In both the Chesapeake and South Carolina, planters borrowed in order to bring more acreage under the plow, finance the purchase of slaves, and import increasingly fine things from Europe.

Yet even as planters tried to emulate English styles in the middle of the eighteenth century, they grew aware of their differences from England. In fact, some of the wealthiest members of colonial society were ardent patriots during the imperial crises of the 1760s and 1770s. The reasons for this Revolutionary fervor lie in the mentality of the great planters in the decades before the Revolutionary War.

It would not be accurate to argue that planter debt or the rituals surrounding the production of tobacco and rice brought about the War for Independence. One could assert, however, that the rising debts of the planters in combination with the mentality of men whose identity was so tightly wrapped up in their agricultural production made them particularly susceptible to the tenets of “country thought”—sometimes referred to as republicanism or radical opposition. “Country thought” refers to a group of ideas floating around in eighteenth-century England, many of which stressed personal liberty and autonomy, emphasized civic virtue, and attacked unbalanced government or military government as inherently corrupt.

From this perspective, the debt incurred to sustain profitable agriculture was also a threat to a planter's liberty and manhood. T. H. Breen has argued that it was precisely because of the culture of planting tobacco that the planters of Virginia's tidewater were early converts to the cause of independence; these same men, including Patrick Henry, George Washington, and Thomas Jefferson, formulated an American brand of country thought with its roots deep in tobacco agriculture.

In the years after the War for Independence, planters continued to wield power, but some of the democratic impulses of the Revolution also seeped into colonial legislatures. In South Carolina, for instance, a number of artisans and mechanics—the muscle of Charles Town's Revolutionary movement—were elected to public office. Overall, the early state governments of the South and, to some extent the national government, were dominated by the planting class.

Plymouth

The Pilgrims who settled the Plymouth Colony were a varied people bound together by a common religion. The Pilgrims sought religious freedom from the Anglican Church. They objected to the corruption of the Anglican Church and separated from it, forming their own church. This strain of separatism was strongest in Scrooby, England, where a church was begun under Richard Clyfton. The original members of the Scrooby group included William Brewster and William Bradford.

In 1607, the Scrooby separatists departed England and fled to Holland to avoid persecution by the English government. The government viewed the separatists as treasonous and was aggressive in its efforts to destroy the movement. The Scrooby separatists eventually settled in Leyden, Holland, which appealed to the fledgling church because of the country's policy of religious toleration.

While safe from persecution in Leyden, church members became dissatisfied with their exile and, by 1617, had resolved to journey to the English colonies in the New World. Limited economic and social opportunities as well as the difference in languages prohibited Leyden from becoming a permanent home to the Pilgrims.

The Pilgrims decided to settle near the colony of Virginia, close enough to settled territory for protection yet distant enough for them to exercise religious freedom. In 1617, the church sent two agents to London to negotiate with the Virginia Company. Their agents were successful in securing approval of

their statement of religious beliefs from the King and the Privy Council, but they failed to secure a land patent in Virginia.

Joint-Stock Company

In 1619, Thomas Weston, a London merchant, became the promoter of the Leyden congregation. Weston had ties to the Leyden church because Edward Pickering, his agent, had married one of its members. On July 1, 1620, under Weston's leadership, a joint-stock company was formed, and the funds were divided into shares. An investment of 10 pounds bought a single share.

The terms of the company were to continue for seven years, and all profits generated by the company would remain in the common stock. At the end of the seven years, all capital and profits were to be divided among the shareholders. All land, houses, and goods would be included in the division of funds. These terms were harsher than what the settlers had originally agreed to. The provision including houses and goods in the division of profits was especially troubling. The company also required settlers to work for seven days a week rather than the five days agreed upon by the church.

The Leyden congregation rejected these terms of settlement. The company's financial backers engaged Robert Cushman to work with the settlers, and it was not until 1621 that he was able to gain their approval of the settlement agreement.

The joint-stock company survived until 1627. The final dissolution of the company resulted in the interest in the colony being sold to the settlers. Under the terms of the liquidation, fifty-eight settlers, the "Purchasers," were involved in the division of property. Single men received one share, which equaled a set amount of property. Heads of families received one share per member of the household. Livestock, housing, and land were all included in the liquidation scheme, with the meadows remaining common areas. Eleven men personally assumed the company's 1,800-pound debt in exchange for a six-year monopoly on trade with the natives.

First Years

The company was plagued by financial difficulties; these delayed departure of the voyage until August 1620. When the ships finally left England, they were short of supplies and dangerously late in attempting the ocean crossing. The *Speedwell*, overloaded and leaky, was forced to return to Plymouth, accompanied by the *Mayflower*. Then, both groups, a total of 102 passengers, crowded onto the *Mayflower* for the voyage.

On November 11, 1620, the *Mayflower* landed at Provincetown Harbor, well north of its destination in Virginia. The settlers spent a month exploring the area for the best place to settle and, on December 16, arrived at Plymouth Bay.

The first winter in Plymouth was severe and resulted in the deaths of nearly half the company. Spring brought the first native visitors. Samoset, a member of the Massasoit tribe, ventured into the settlement in March. He introduced them to Squanto, one of the few remaining Patuxet Indians; the two men helped the settlers, teaching them how to plant and harvest corn. Squanto lived in Plymouth until his death in 1622.

In November 1621, the *Fortune* arrived from England, bringing thirty-six new settlers and a land patent. John Pierce was named the grantee for the land. The terms of the patent included 100 acres per person, 1,500 acres for public purposes, freedom to trade and fish along the coast, and the authority to make laws. The patent did not specify land boundaries.

Settlers continued to arrive in the early years of the colony. Many did not share the Pilgrims' religious convictions but had paid their own way to the settlement. The "particulars" were free to work for themselves, but they were shut out of Plymouth government and the Native American trade. Emigration to Plymouth in large numbers continued throughout the 1630s. There was little growth in the colony between 1640 and 1650, but after that period of stability the push for expansion and land resumed. The result was a colony whose boundaries grew ever closer to those of the Native American population. By 1675, the Plymouth Colony boasted a population of 7,500 in an area of 1,600 square miles.

Housing in the Plymouth Colony was generally modest. In the initial stages of settlement, small, crude cottages provided the most basic shelter. As the colony became more settled, solid-frame homes covered with clapboards became the rule. These small one-and-a-half-story homes were the center of family life. Families tended to be small nuclear groups composed of a husband, wife, and their children. Many households also included servants, who, in the early years of settlement, were usually hired or indentured, as slavery existed only on a very small scale. Plymouth's social life revolved around the church.

Church

John Lyford was the first minister at Plymouth. Initially embraced by the colony, he was banished from Plymouth in 1625 because of his opposition to Governor Bradford. Plymouth would not obtain another minister until 1629, when Ralph Smith arrived; his tenure was short-lived, too. John Reyner occupied the pulpit at New Plymouth from 1629 until 1654.

The church was supported by Plymouth's civil government, although there was no specific legislation supporting the church until 1650, when the General Court passed laws punishing slander of the church or its minister. In 1651 legislation requiring church attendance was adopted.

An early visitor to Plymouth gave the following description: "the harbour is not only pleasant for air and prospect, but most sure for shipping, both small and great, being land-locked on all sides. The town is seated on the ascent of a hill...." (Private Collection/Bridgeman Art Library)

Local churches exercised much control over their own governance. They elected their own ministers and established the conduct of the worship service, as well as sitting in judgment of local members brought before them. This self-determination extended to the exercise of the Half-way Covenant, whereby the children of members of the church could be admitted to church membership without professing a conversion experience.

The Plymouth Colony, like most of its New England neighbors, experienced a decline in religious unity during the mid-seventeenth century. There was also a marked decline in the numbers of church members throughout the colony. Membership in the church was restricted to those who professed a conversion experience; their testimony of conversion was given before the church members, who decided whether or not to extend membership to the candidate.

In order to bolster flagging church memberships, a number of ministers throughout the New England colonies, particularly in Massachusetts, advocated the adoption of the Half-way Covenant. But churches in the Plymouth Colony generally rejected this compromise.

Efforts to suppress Quakerism provide another example of the increasing religious splintering that occurred. Quakers had first arrived in Plymouth in 1656, and the following year legislation to suppress them was passed by the General Court. In 1658, severe punishments, including whippings, were meted out to some Quakers. The persecution of Quakers continued until an order from the Crown in 1660 required that all Quakers be sent to England for trial.

In 1668, John Cotton was elected and ordained as the minister for the New Plymouth church. Cotton's election indicated the Pilgrims' move from their separatist stance to the more moderate Puritan view of working within the established church to make it better.

Government

When the *Mayflower* landed at Provincetown in November 1621, the settlers agreed to a contract of government known as the Mayflower Compact. Such a document was necessary because the patent the joint-stock company had secured from the Virginia Company was invalid, given that they had failed to settle within the specified boundaries. John Carver was chosen as the first governor; his death shortly after their arrival resulted in the election of William Bradford as governor.

The governor and the General Court were the primary organs of government for the colony. The term *freeman* was used to denote citizenship, though there was no legislation to define what constituted a freeman until 1668. Freemen were allowed to vote and hold office in the colony. Legislation in 1656 required that those who wished to obtain the status of freemen first gain the approval of the freemen in their town before submitting their names to the General Court. In 1668 legislation established freemen as those who met minimum land ownership requirements.

The year 1665 brought about the establishment of a uniform local court system. Select courts were established in every town and were composed of three to five men elected by the town and confirmed by the General Court. These courts had full authority over civil suits in amounts up to 40 shillings. In addition, the select courts heard lawsuits between English settlers and Native Americans that resulted from English livestock damaging the natives' crops.

In 1685, county courts were established in the colony and a new edition of *Colony Laws* was published, with significant revisions to the 1636 codification of colonial law.

Economy

Plymouth's economy was limited by its geographic location. The lack of good port facilities limited trade. Additionally, Plymouth's settlers lacked the necessary capital and contacts with English commercial circles to expand their economy.

The Plymouth economy was influenced by the sea. Fish and whale oil were popular exports, though the trade was generally only coastal rather than transatlantic. Shipbuilding and associated trades were also important in Plymouth. There also was limited success with ironworks and some local industries, including grain and sawmills.

Agriculture was primary to the colony. Communal grazing lands supported a variety of livestock. Edward Winslow, one of the original colonists, made several trips between England and the Plymouth Colony. In 1624, he returned to the colony with three heifers and a bull for the entire community. This livestock would prove to be essential. With the arrival of the Puritan settlers at Massachusetts, the sale of livestock to colonists there became a major source of revenue. An additional source of revenue for the colonists was the export of beaver skins to England.

The government regulated the economy. The primary ways it exercised this power were through setting general prices and wage levels and by granting monopolies that served the best interest of the public as a whole.

King Philip's War

The settlers of the Plymouth Colony initially enjoyed a peaceful relationship with the Wampanoag and Massasoit Indians. A period of mild unrest in 1662 marked the first disruption in that relationship. Plymouth's policies required payment to the native peoples for every purchase of their lands; the growth of the colony in the second half of the seventeenth century led to greater purchases of Native American lands in the 1660s. Settlers' livestock often harmed the native peoples' crops, as the white settlements grew closer to native villages. This increased proximity also resulted in efforts to proselytize the western Native American population.

In 1671, King Philip (Metacom), the Wampanoag chief, was forced into signing a peace treaty. The establishment of a white community near the Wampanoag village at Mount Hope had resulted in escalated conflict between settlers and the native peoples. In the treaty that King Philip signed, he acknowledged himself as subject to the king of England and the law of Plymouth. Despite the treaty, unrest continued to grow and ultimately led to the outbreak of war.

In 1675, Wampanoag and Narragansett Indians began conducting raids on communities throughout Plymouth in response to the decade of unrest that had preceded the war. The colony's militia attempted to trail the natives and attack them in order to protect the colony. The militia, however, lacked experienced military leadership and spent most of a year blundering throughout the countryside in a disorganized attempt to locate Philip's warriors. The war spread throughout the New England colonies and was not settled until the militia destroyed King Philip's camp and killed him in the summer of 1676.

Final Years

Plymouth's status as an English colony meant that it was subject to changes that were the result of English politics. The restoration of King Charles II to the throne in 1660 brought a degree of uncertainty to the colony. While Plymouth had obtained a general land grant, the colony had never obtained a royal charter that specified its boundaries. In 1665, the king sent royal commissioners to visit the New England colonies. Plymouth requested of these commissioners that they petition the king for a royal charter on their behalf, but the colonists failed to take the more aggressive action of sending their own envoy to request the charter.

In 1677, the Plymouth Colony, without a royal charter, petitioned the king for the rights to the Mount Hope lands that were occupied by the Wampanoag but were now viewed as open to English settlers in the aftermath of King Philip's War. Three years later, Governor Josiah Winslow received a letter from Henry Coventry, the secretary of state for the American colonies, indicating that the Crown would grant the colony's request for title to the Mount Hope lands. Secretary Coventry also indicated that the king would respond favorably to a request from the colony for a royal charter.

Winslow died later that year. His successor, Thomas Hinckley, continued the colony's efforts to obtain a royal charter but again failed to take any aggressive action. In 1685, Plymouth's efforts to obtain a charter were invalidated by the Crown's decision to reorganize the New England colonies. King James II implemented a plan that consolidated the colonies into the Dominion of New England and appointed Edmund Andros the general governor. Authority under the new Dominion was centralized at Boston. The New England colonies chafed under this arrangement, and the news of the overthrow of James II in 1688 resulted in the overthrow of Andros in Boston the next year. Plymouth reverted to its former colonial government structure.

Plymouth's autonomy continued until King William III undertook a reorganization of Massachusetts in 1691. Under this plan, Plymouth was annexed to the Massachusetts Bay Colony and its citizens became subject to that colony's authority. The Plymouth Colony as a separate entity ceased to exist; however, its legacy of religious freedom and success despite overwhelming odds continued.

Pocahontas (c. 1594–1616)

Although myth and speculation surround Pocahontas, the famous storybook “Indian princess,” there is a substantial amount of recorded fact regarding the favorite daughter of the powerful Algonquin Chief Powhatan.

Born around 1594, Matoaka (nicknamed Pocahontas, meaning “playful” or “naughty one”) met the legendary John Smith of Jamestown, Virginia, in 1607, in her father’s village of Werowocomoco on the north shore of the Pamunkey River (now called the York River). Lively, intelligent, and resourceful, the young Pocahontas was described by one Englishman in 1610 as

of a colour browne, or rather tawnye ... round-faced, with the fore part of her grosse and thick black hair shaven close, and the very long thicker part being tied in a pleate hanging down to her hips.

Whether the precocious 12-year-old saved Smith from a violent death at the hands of her father has never been substantiated. The tale was not recorded until after Pocahontas traveled to London years later. The young Pocahontas, however, did bring gifts of food and supplies to the starving men and boys of Jamestown. Still, of the original 104 Englishmen deposited on the shores of the James River in May and June 1607, only forty were alive in late December, when another ship returned with seventy to a hundred more settlers, including two women.

The fabled Pocahontas, daughter of the chief Powhatan, converted to Christianity, married John Rolfe, and traveled to London in 1615 as Lady Rebecca Rolfe. She was feted at court but died before returning home. (Brown Brothers, Sterling, Pennsylvania)

At first Chief Powhatan (whose real name was Wahunsonacock) opposed settlement by whites on his lands. Chief of the thirty-plus tribe confederacy of Powatanas—a thriving agricultural and fishing nation totaling between 9,000 and 15,000 people—he had been given an ominous prophecy by one of his shamans that foretold the destruction of the Powatanas. In spite of this fear, Chief Powhatan eventually feasted and entertained the ambitious and feisty John Smith. He also befriended Jamestown’s settlers, at least for a time.

In 1609, after being badly injured in a gunpowder accident, John Smith returned to England. He would not see Pocahontas for another seven years. In the meantime, Pocahontas married Kocoum, “a captainne of Powhatan.” There is some indication that she bore a child (a girl) at this time, but many believe the child died.

By 1612, relations between the settlers and the Powatanas had deteriorated. Captain Samuel Argall, fearing an attack by several of the disgruntled tribes and acting in retaliation for the capture of eight Englishmen, tricked and then kidnapped the unsuspecting Pocahontas. During her captivity, Pocahontas met and married the widowed John Rolfe, the man credited with planting and commercializing the first tobacco crop in America. This crop became so important that its export later ensured Jamestown’s survival; in 1617, some 50,000 pounds of cured tobacco was exported to England.

Whether the young woman fell in love with Rolfe or whether the marriage was part of her conditional release, however, is not clear. It is known that Pocahontas converted to Christianity, was baptized Rebecca, and married John Rolfe on April 5, 1614. Reluctantly, Powhatan gave his consent, along

with a large piece of property. This union represented a great alliance for the English, ensuring peace with the Powhatan. The peace, unfortunately, would come to a quick end after Powhatan's death in 1618.

One year after John Rolfe and Pocahontas were married, Pocahontas gave birth to a son, Thomas. Not long after that, the young family traveled with Sir Thomas Dale back to London. Sir Thomas Dale hoped to secure more funding and more settlers for Jamestown; Rolfe hoped to secure a trade agreement for his expanding tobacco crop. Accompanying them on this voyage were Pocahontas's sister Matchanna and her husband Tomocomo, as well as several other Powhatan men and women.

In England, Pocahontas was viewed as a princess and eagerly received at the court of King James I. She also was reunited with John Smith. But after several months in England, Rolfe was anxious to return to America. The group was to set sail in March 1616, but Pocahontas fell ill and the ship's departure was delayed.

Pocahontas died in Gravesend, England, at the age of 22. The church record reads: "1616 March 21, Rebecca Wrolfe, Wyffe of Thomas John Wrolfe Gentleman, a Virginia Lady borne was buried in ye Chancell. Entered by Rev. Nicholas Frankwell." The gravesite was later destroyed when the church had to be rebuilt.

Although John Rolfe returned to Jamestown, young Thomas Rolfe remained in England to be raised by Rolfe's family. Incredibly, the descendants of Pocahontas, who derive from this son, include many distinguished Americans, including Thomas Jefferson Randolph, the grandson of President Thomas Jefferson.

Politics and Government

Five European nations founded enduring societies north of the Gulf of Mexico. Only one of them left any lasting legacy upon the political history of postindependence North America: Great Britain.

Royal authority in New France and New Spain operated through appointive officials, who owed their posts to court patronage and whose duty it was to maintain order and dispense justice on behalf of absolute monarchs. Under such circumstances, no opportunity arose for settlers to gain experience in lawmaking or to master crucial aspects of civil administration.

New Netherland and New Sweden functioned as corporate enclaves staffed by managers, employees, and various independent contractors—not as political societies based upon the rights and duties of citizenship. Their formative period left no tradition of self-government, much less any ethos of public service. Only colonists from England established institutions that would influence the future course of both constitutional history and political thought during later centuries.

Imperial Institutions

No factor shaped the founding of English-speaking North America more fundamentally than a strong disinclination by both Crown and Parliament to bear the heavy, initial costs entailed in acquiring overseas dominions before the 1660s. English monarchs and statesmen were also long distracted from colonization ventures by the events preceding the civil wars of the 1640s and then by the Interregnum (1649–1660) that followed the beheading of Charles I. During the first half century of trans-Atlantic expansion, the burden of empire instead fell upon such corporations as the Virginia and

Massachusetts Bay Companies, such proprietors as the first two generations of Maryland's Baltimore dynasty, and such privately organized, self-financing groups of emigrants as the religious exiles who founded Plymouth, Rhode Island, and New Haven.

English settlers consequently found themselves thrown upon their own devices for keeping order and resolving controversies by the general inattention of officials in London toward colonial affairs. In order to enlist cooperation from their resident populations, leaders in the early colonies eventually granted the right of making laws to democratic assemblies by entitling a large portion of free, adult males to vote and hold office (subject to qualifications based on property ownership and, sometimes, religion). The rise of representative government was crucially important for Anglo-American political history, not only as the root of all subsequent constitutional development but also as the basis for later claims that long-standing custom had endowed the colonial assemblies with near-autonomous rights of self-governance.

For almost three decades after Charles II's coronation in 1660, however, the restored Stuart dynasty pursued ambitions of turning Great Britain into an absolutist state modeled after the example of Louis XIV in France. The Stuarts sought to tighten control over their overseas possessions through royal bureaucrats, much as the Bourbons did in New France. Beginning in late 1660, the monarchy started supervising overseas affairs through a special committee of the Privy Council. By 1675, when it was reconstituted as the Committee on Trade and Plantations (or Lords of Trade), this committee had emerged as the first effective agency for monitoring colonial developments and enforcing Crown policies in America. The Stuarts eventually moved to increase the number of dominions under their direct control (known as royal colonies, as opposed to those created by charters to corporate entities or grants to proprietors). Before 1660, the only royal government on the North American mainland had been in Virginia, but during the early 1680s, New Hampshire, New York, and Massachusetts came under the monarchy's immediate rule. By 1732, eight of the thirteen original colonies had Crown status. (Connecticut and Rhode Island retained charter privileges, while Maryland, Pennsylvania, and Delaware continued as proprietaries.)

James II showed exceptional animosity toward parliamentary institutions during his brief reign (1685–1688). Striving to curb legislative rights and privileges both at home and abroad, he moved first to dispense with representative government in North America. The king consolidated every colony from West Jersey through New Hampshire into the Dominion of New England. The dominion was a prototype for reorganizing the empire along the model of Spanish America, where viceroynalties were administered by governors-general, appointed by the court at Madrid with power to promulgate ordinances and impose revenues within their jurisdictions. No provision was made for elective assemblies to pass laws or enact taxes. Before James II could abridge legislative self-government in his other American dependencies, however, he was driven from power by the Revolution of 1688, which established constitutional protections for Parliament's traditional rights.

The Declaration of Rights, presented to William and Mary in 1689, defined the conditions under which they would be recognized as king and queen of England, opening the way to constitutional monarchy. William and Mary reinstated representative assemblies as an integral part of colonial administration. (British Museum, London, United Kingdom/Bridgeman Art Library)

William III and Mary II, who succeeded James II, countermanded his autocratic measures and reinstated the legislatures annulled by him. The British government thereafter treated Anglo-American assemblies as an integral part of colonial administration. Representative government functioned as a highly effective and practical vehicle for mobilizing support from American elites and taxpayers, whose financial resources not only paid the salaries of each colony's executive officers and judges, but often provided substantial military assistance during wartime. British ministries consequently enjoyed the luxury of reaping a significant influx of customs duties from American commerce, while the cost of governing those overseas possessions amounted to a pittance of the Treasury's annual budget.

In 1696, the Privy Council formed a new committee, the Lords Commissioners of Trade and Plantations (or Board of Trade), to monitor commerce and fisheries, evaluate candidates for royal governorships and other positions, formulate policy concerning events in America, and identify any acts passed by colonial legislatures that should be disallowed by royal veto. Interest in colonial affairs steadily waned among members of Parliament and the royal bureaucracy after 1725, however, and, over the next two decades, the Board of Trade reflected this general apathy by pursuing its duties indifferently, if not lethargically. Aside from a brief resurgence of activity and influence at the Privy Council under the Earl of Halifax for nearly a decade after 1748, the

Board had minimal impact upon politics in the British colonies. Its most important activity was reviewing legislative acts for the royal signature, and in this task the Board proved quite accommodating to colonial wishes by approving all but 469 (5 percent) of the 8,563 statutes submitted through 1776. British policy and attitudes toward America evolved in an atmosphere of reasonably well intentioned—if poorly informed—neglect, so that imperial oversight from London was rarely intrusive or heavy-handed.

In March 1765, the Stamp Act challenged colonial notions of local autonomy and awakened a dormant dispute over the degree of American exemption from parliamentary laws. Angry protests led to repeal of the tax—as depicted in this British cartoon funeral—in March 1766. (New York Public Library, New York)

By the 1750s, the British Empire, which then included about 1.5 million inhabitants throughout the Western Hemisphere, had matured into a conglomeration of self-governing political units whose constitutional relationship to the British monarchy and Parliament lacked any formal definition or even mutual understanding. Parliament saw itself as having virtually unlimited lawmaking authority within all the monarchy's possessions except Ireland, which had its own parliament, endowed with essentially sovereign powers over taxation, and its own internal governance.

Colonial legislative leaders conceded that, as a matter of practical necessity, deference should be accorded to Parliament for standardizing legal institutions critical to ensuring justice and promoting prosperity equally throughout the empire. These measures included amending the common law, bringing efficiency to judicial proceedings, and making uniform regulations for contracts, currency, or commerce. Otherwise, however, Anglo-Americans assumed that their assemblies occupied a status similar to Ireland's parliament: subordinate in authority and prestige to Parliament, but still endowed with exclusive rights of levying taxes within their own boundaries and of regulating their own internal affairs by statutes enacted under the royal signature. A latent conflict thus existed over the degree to which Americans could claim exemption from parliamentary laws. This issue remained dormant until the 1765 Stamp Act challenged American notions of local autonomy by imposing taxes upon a wide range of legal and business transactions in the colonies.

Representative Government

The first colonial assembly convened at Jamestown, Virginia, in 1619, twelve years after the colony's founding. The Virginia Company permitted any parish or other community to elect two deputies who could attend sessions with the governor and his appointed council, provided that the constituency paid its delegates' expenses. While at the assembly, the representatives' primary duties were to endorse decisions made by the company shareholders in London and enact necessary ordinances. The assembly's actions lacked legal force without later approval from company headquarters, however, and it had no right to meet on a recurring basis.

When Virginia became a royal colony in 1624, the Crown clearly hoped to govern the colony with officials independent of popular influence, since its governors dispensed with calling the legislature into session. The king's need for local sanction of his plan to inaugurate a tax on exported tobacco finally led to calling an elected assembly in 1628 to enact the levy. Annual sessions only began to be held on a regular basis after 1630. The members organized themselves on the model of the House of Commons in 1634 by setting counties as the basic constituency (along with a few boroughs) and allocating two seats for each, regardless of population.

Representative institutions next developed under the Massachusetts Bay Company, whose charter established a governmental structure appropriate for a business corporation. The charter stipulated that the investors (or "freemen") would elect a board of trustees (or "assistants," chaired by a "governor") at shareholders' meetings (or "General Court") where all major decisions and regulations would be debated and adopted. The company moved its headquarters to the colony by instructing the first governor to carry the charter to New England in 1630. When the General Court first convened soon after, fewer than a dozen shareholders had apparently emigrated, and just eight attended the meeting in their role as freemen. They transferred the power of choosing executive officials, making laws, and laying taxes from the freemen in general to the assistants and governor, who—of necessity—consisted of the same eight individuals. The assistants broadened the definition of a freeman in 1631 to include all adult men who were full church members, by which citizenship came within the reach of every male settler, although their political duties by then extended no further than voting for a legislative council.

In response to objections made in 1632 that the assistants had exceeded their authority by levying the colony's first tax, the General Court decreed that prior notice would be given when future revenues were needed and that no tax would be imposed without majority approval from a deputation comprised

of two freemen sent from each of the towns specifically to vote on that subject. Two years later, other protests arose that the freemen had been denied their right under the charter to participate in the making of laws as well. This grievance defied any solution based on a literal reading of the charter, since, even at that early date, it was impractical for the several hundred men admitted as citizens to function efficiently as a legislature, and within a few years, the number of freemen would certainly exceed 1,000. The colony's leaders therefore directed each town to elect two delegates to join with the assistants and governor in enacting ordinances. The transmutation of a commercial bureaucracy into a civil republic was then essentially accomplished.

Representative government did not mature in Virginia and Massachusetts until after each was first settled. Legislative bodies emerged in both colonies out of the administrative apparatus of a business enterprise, but each proved sufficiently durable to continue functioning after the chartered company from which it sprang had expired. In neither colony was the government consciously fashioned after England's parliamentary system of a popularly chosen House of Commons, a hereditary House of Lords, and the reigning monarch. Elected representatives in both Virginia and Massachusetts did not at first organize themselves into a separate chamber interacting with the other branches of government, but rather sat together with the governor and his appointive council, to whose agenda and judgment they generally deferred. Virginia's legislature almost certainly continued to hold unicameral sessions until 1642, while the Massachusetts General Court became bicameral in 1644.

Democratically chosen assemblies emerged elsewhere in Anglo-America in a manner similar to developments in Virginia and Massachusetts. Rarely did the first sitting of any colony's legislature occur until two years after its earliest settlers had arrived, while in Virginia, Plymouth, Rhode Island, New York, and Georgia, the opening sessions of their assemblies were not held until a decade or more after their founding. Most assemblies either evolved from corporate structures or were designed by proprietors given royal land grants to encourage overseas expansion, and many bore absolutely no resemblance to the British Parliament's structure or manner of lawmaking. For example, the Fundamental Constitutions of Carolina (1669) envisioned a single-chamber parliament wherein the proprietors, commoners, and indigenous nobility—a fanciful mix of landgraves, caciques, and manor lords—sat together. Bills could only be drafted by the proprietors, however, and the role of commoners and nobles was limited to accepting or rejecting what was placed before them.

Most colonies required about two decades for legislative government to establish continuity and mature into bicameral institutions. As in Virginia and Massachusetts, elected representatives initially met in joint sessions with the governor and his council, and they routinely acted in a judicial capacity on an *ad hoc* basis. No assembly attempted to base representation upon districts of equal populations (along lines of the modern concept of "one man, one vote"); instead, members were apportioned among various units of local government at a fixed ratio (usually two for each county, town, or parish).

Colonial assemblies developed in most respects along parallel lines after 1690. Despite their varied origins, Anglo-American governments ultimately came to resemble Great Britain's bicameral legislative system, in which bills required approval by both a popularly chosen assembly and an appointive governor's council, save for a few exceptions: Pennsylvania's legislature was unicameral since its council could not reject acts passed by the lower house, while in the de facto republics of Rhode Island and Connecticut, both houses of the legislature were elected by voters. In the royal colonies, especially where the chief executive was a Crown official, it was natural for Americans to see their governments as "little Parliaments" and to idealize them as having inherited the full panoply of constitutional rights and liberties won during the long struggle since Magna Carta to secure the "rights of Englishmen."

Local Government

Anglo-Americans patterned their own local governments after institutions long established in their homeland. England's basic unit of local jurisdiction was the county (or shire), and its chief officials—the sheriff, justices of the peace, clerk of registration, coroner, and constables—were all appointed directly or indirectly by the Crown and not elected. It was common for members of the town councils in larger cities to be appointed to office for life by the incumbents, independently of any elections. Even when self-governing boroughs chose their administrative councils by popular vote, rarely did the franchise include more than a quarter of adult men.

Many of England's unincorporated, agrarian villages, nevertheless, had inherited customary practices of self-government from medieval times. Heads of households within an isolated parish or tenants on a large manor frequently would meet each year to address neighborhood problems, allocate access to shared resources like common lands, review maintenance of pathways or boundary fences, pass village bylaws, and elect officials to oversee local affairs. The first generation of New Englanders adapted this precedent to their own settlements through town meetings convened at least once every year, so all heads of families could vote for selectmen, who would supervise the next year's communal business. Town government quickly spawned many lesser officers with specialized responsibilities, such as a moderator of meetings, clerk, treasurer, tithing-man, tax assessor and collector, surveyor of highways, fence viewer (person hired to make sure fences were in good order), livestock brander, keeper of the animal pound, and weight or measure sealer (official who verified the accuracy of weights and measures). By 1750, the average Connecticut town was appointing over sixty adults to oversee various responsibilities for the local government.

Outside of New England, eastern Long Island, and parts of northeastern New Jersey, few colonists lived in towns. The largest cities usually had municipal councils elected by property-owning citizens—but not always. Philadelphia's charter of 1691 vested its government in aldermen who were appointed with lifetime tenure; the aldermen nominated and approved their own successors and, for good measure, also chose the mayor. Charles Town, South Carolina, survived the entire colonial era without any municipal government; law and order in the city rested on justices of the peace and a sheriff, whom the governor appointed, while Anglican parish vestries dispensed poor relief and performed other social services.

Counties were the basic unit of local government in the Southern and mid-Atlantic colonies (except South Carolina, which was divided into parishes). Even in New England, with its strong tradition of direct democracy through town meetings, counties served as the chief jurisdiction for civil administration and the primary venue for legal proceedings. As in Great Britain, the key personnel of county government were the justices of the peace (or magistrates), who formed a collective tribunal empowered to try misdemeanors, settle disputes over debts and contracts, and enforce the slave codes with rigor. Magistrates could dispense decisions individually in petit sessions, without a jury, on minor matters or collectively at quarter sessions, with a jury, in major cases. The county court also functioned in an executive capacity as an omniscient institution that could initiate almost any action necessary for the public welfare and had authority to levy small taxes for essential community expenses. The magistrates, furthermore, appointed lesser officials responsible for various public services, such as overseers of the highways, overseers of the poor, the slave patrons officers, and constables, and they could rebuke or remove these subordinates for nonperformance of their duties. The sheriff publicized and enforced the county court's orders; he also maintained the tax rolls and conducted elections. The clerk acted as secretary when the justices conducted business, and he kept the courthouse open on a daily basis in the course of serving as a general registrar.

Magistrates, sheriffs, and clerks all obtained their posts through the governor's patronage and held office until either their commission was rescinded or, as under British law, the current monarch's death obliged them to resign. Vacancies within county government were usually filled out of recommendations to the governor from the sitting justices, who invariably nominated relatives, friends, and other associates drawn from the ranks of the wealthiest tenth of landowners, usually termed the gentry. Wherever communities had been settled for two or three generations, county government assumed an oligarchic and quasi-hereditary character, until the interconnections between its justices, sheriffs, and clerks formed a tangled cousinry of the area's leading families.

The county court system ensured that local affairs would be administered by local residents, who could make knowledgeable decisions for their neighbors based on the familiarity that comes with long residence. It was also a fundamentally elitist arrangement for sharing power that excluded men of average means and middling families from any influence or participation.

Voters, Candidates, and Elections

In every colony but Rhode Island and Connecticut, the choice of a representative to the assembly was the only occasion when voters participated in a colonial-level contest. Massachusetts, Rhode Island, Connecticut, Pennsylvania, and Delaware elected a new lower house each year. In the other eight colonies, governors had complete discretion of calling for a new assembly as they saw fit, as long as no house sat for more than seven years, and they usually scheduled elections about every three or four years.

By the 1750s, legal qualifications for voters were fundamentally similar in all the mainland colonies. Every colony restricted political participation to white, adult, male property owners, but relatively few possessions were needed to qualify as an elector. The usual stipulation was that a man either had to have negotiated a mortgage on at least 50 acres or have accumulated other property worth 40 to 50 pounds. Most married men would have owned tools, household furnishings, or livestock valued at 50 pounds by age 30, if not before then, and the majority of farmers probably had saved the down payment for 50 acres by age 35 or shortly thereafter. Property qualifications primarily excluded young men from the polls, but over the course of their lifetime, likely nine-tenths of adult, white males acquired enough wealth to vote by age 40. The main effect of property qualifications was to keep most men from becoming enfranchised for a decade or more after they turned 21, but not to block them from exercising the suffrage permanently.

Only four colonies set property qualifications for sitting in the legislature that were beyond the means of most persons with middle-class status (500 acres in South Carolina and Georgia, 1,000 acres in New Jersey, and real estate worth 300 pounds in New Hampshire; total net worth of 500 pounds also qualified a person in all the preceding except Georgia). In eight colonies, including all six with the largest populations, anyone who could vote was eligible to serve as a representative. It was nevertheless not practical for ordinary citizens to perform assembly duty, because the position placed a heavy burden on an individual's time and resources. Legislators received no salary for their services and only a modest living allowance, which was set at minimum level and did not always cover full costs, while at assemblies. Assembly sessions rarely lasted less than one month, often two, and sometimes three, and, during this time, members could not pursue their usual employment. Few middle-class persons would have been able to afford the sacrifice of time and money, particularly if the governor summoned the legislature for business at planting or harvest seasons, when even wealthy planters with overseers tried to personally supervise the work on their estates.

As a consequence, it was virtually foreordained that colonial legislatures would be overwhelmingly comprised of the economic and social elite. By the end of the colonial period, the typical member of Virginia's lower house owned 1,800 acres and 40 slaves. Two-thirds of all South Carolina assemblymen after 1750 were planters who worked their estates with eighty or more slaves. Nearly three-quarters of all New Jersey representatives held 600 acres or more and ranked among the wealthiest 5 percent of that colony during the quarter century prior to the Revolution.

The assemblies also began to spawn dynastic groups like the First Families of Virginia, which were notable for sending successive generations of kinsmen into the legislature. In South Carolina's lower house, for example, about half the members were related to other representatives as sons, fathers, or brothers in the half century before 1775. Similarly, John Adams once remarked that in most Massachusetts towns, the office of assemblyman usually rotated among a circle of extended relatives descended from or connected by marriage to just three or four distinct family groups.

The manner of conducting elections acted as a deterrent to high turnout among voters. Eight of the colonies had no regular schedule for balloting. Governors could issue the writs at any time, and the law directed that sheriffs need give only a few weeks' notice by posting announcements at commonly frequented sites, such as taverns. In rural areas, where few—or no—newspapers circulated, many electors were not likely to learn that a new assembly was to be chosen until after the fact. The county courthouse generally served as the only polling place, so that outlying voters had to travel long distances over unpaved, narrow roads, and some would have to bear the expense of overnight lodging. These circumstances made it inevitable that numerous freeholders would be left uninformed of elections and many others would find it personally inconvenient, time consuming, and even expensive to get to polls.

Turnout at elections consequently remained low during colonial times. It was unusual for a majority of adult white males to cast ballots, although participation rates sometimes ranged from 67 percent to 80 percent on rare occasions when hotly contested issues were at stake. The usual level of turnout ranged from 25 percent to 40 percent of adult white males. Assuming that 25 percent to 40 percent of free males over 21 were likely without sufficient property to exercise suffrage at any given moment, such a rate of turnout would suggest that slightly less than half of qualified voters went to the polls on average.

Colonial elections usually resulted in a high percentage of new members being freshly chosen. Turnover among assemblymen was lowest in Delaware, at about 20 percent, and highest in Rhode Island, at over 60 percent. Elections in the colonies produced significantly more change than in Great Britain. Turnover in the House of Commons alternated between 27 percent and 35 percent, while most colonial assemblies had approximately 35 percent to 50 percent of their membership change during most of the period after 1760.

As the eighteenth century progressed, however, elections in America became less volatile. Turnover in many colonies began to approximate that of Britain's House of Commons. As the colonial period came to an end, only in Rhode Island did elections routinely send a majority of newcomers to the legislature.

The explanation for early America's high rate of legislative turnover does not seem to have been a high level of partisan rivalry (unlike Great Britain, no

organized parties existed in the colonies), but rather a tendency for most representatives to retire voluntarily after two or three terms. In large part, legislators seem to have left public office after relatively short tenures because of the inconvenience to their private lives and the interruption of their financial affairs caused by attending lengthy sessions at the capital. Politicians consequently found themselves shouldering a public burden that offered little monetary or personal award—save recognition of one's abilities in a society that offered few other chances to win esteem from the community at large—and, not surprisingly, most of them tired of its demands after a few years.

Rise of the Assemblies

The upper class of the British mainland colonies increasingly identified their own collective interest with the colonial government's representative element after 1690. Accordingly, they strove to buttress the standing of their local assemblies with the same powerful privileges that had been confirmed as belonging to the British House of Commons following the Revolution of 1688. This development reversed the balance of legislative power established in the early seventeenth century, when the legislatures' lower houses did little more than ratify measures initiated by the governors or their councilors. Continued deference to the chief executive and his appointed advisors ultimately proved incompatible with defending local interests against outside interference, since the Crown (or an absolute proprietor) named the governor, who then appointed his own advisers to the upper house everywhere but in Connecticut and Rhode Island (where they were popularly elected). The lower houses of assembly increasingly asserted their own authority during the eighteenth century as a means of checking the potential threat to local autonomy posed by royal and proprietary officials.

The assemblies simultaneously began shedding the amateurishness and inefficiency that had characterized their deliberations for much of the 1600s. The lower houses steadily became more proficient in such areas as keeping accurate and detailed records of official activities, gaining greater mastery over parliamentary procedure and rules of order, and making their internal organization more efficient and flexible through greater reliance upon standing committees to conduct recurring business and by taking greater care in naming competent individuals to key leadership positions. The assemblies became more professional and hard working, in large part through the emergence of a new generation of speakers of the house, who were more politically sophisticated, strong-willed, and determined to elevate their assembly's standing to a level commensurate with the status of Britain's House of Commons. These speakers frequently held long tenures, and they led the members in an often spirited offensive to expand their assembly's institutional rights and privileges.

The lower houses eventually shifted the locus of constitutional power away from the governor and councilors by refusing to permit any external meddling in their own internal proceedings, by gaining firm control over taxes and the budget, and by refusing to appropriate permanent, independent salaries or other incomes to executive officers. By keeping governors dependent upon the passage of an annual bill for their compensation, the lower houses used the power of the purse to ensure that governors could not allow long periods to pass without calling the legislature into session. They also generally withheld final approval of the government's budget until the governor had agreed to sign the major acts sought for passage by the speaker. Despite a considerable range of gubernatorial powers (including the rights of vetoing any measure, of summoning or dismissing a legislative session at will, of calling elections with little advance notice, and of packing the upper house with his own supporters), a determined lower house had the advantage because the governor was dependent upon local revenues to carry out his duties—not to mention receive his pay.

Because of the general inattention to colonial affairs by the Privy Council and even the Board of Trade's members, governors rarely obtained any effective backing from the British government that would enable them to coerce assemblies into compromising on most disputes, much less to press a lower house into backing down on matters of constitutional principle or measures strongly demanded by the voters. Under such conditions, the lower house succeeded in gaining the initiative in legislative proceedings, establishing itself as the dominant force in colonial government, and maintaining that position throughout the eighteenth century.

Well before the colonial period ended, representative government had displaced imperial or proprietary institutions as the center of political power in Anglo-America. The lower houses of assembly no longer acquiesced to the constitutional primacy of the governor and his council as they had during the seventeenth century. They saw themselves as entitled to the same legislative privileges accorded by the British Crown to the House of Commons, and they exercised de facto local autonomy in nearly all matters of lawmaking, except regulation of oceanic trade, issuing currency, and amending the common law.

Ponce de León, Juan (1460–1521)

A Spanish explorer, Juan Ponce de León conquered and settled the island of Puerto Rico. He is most famous for his futile and ill-fated search for the legendary fountain of youth in Florida.

Born into a powerful and noble Spanish family in 1460, Ponce de León was appointed a page at the court of Ferdinand of Aragon as a youth. He was also part of the military expedition that conquered Granada in Southern Spain in 1492, ending the 700-year-long Moorish presence on the Iberian Peninsula.

His career as an explorer may have begun just after that, as he was believed to be a member of Christopher Columbus's second expedition to the Western Hemisphere. By 1502, Ponce de León found himself living in Hispaniola, the base of the Spanish empire in its earliest years, where he served as a captain and provincial governor of the eastern half of the island under Governor Nicolás de Ovando.

When rumors came back of gold on the nearby island of Puerto Rico, Ponce de León organized an expedition that explored and conquered the island from 1508 to 1509. He also established Puerto Rico's first settlement at Caparra, just outside modern San Juan. Appointed governor of the island, he was soon removed by rivals and returned to Hispaniola.

Encouraged by the Spanish government, Ponce de León followed up on a new rumor of the existence of a fountain of youth on Bimini Island in the Bahamas. Once again outfitting an expedition with his own money, he erred in his navigation and landed in Florida around Easter 1513, near the present-day city of St. Augustine. He named the territory Florida, after the Spanish word for the Easter holiday, *Pascua Florida*.

Continuing on his search for the fountain of youth, he sailed down the Atlantic coast of the Florida Peninsula, through the Florida Keys, and up the Gulf Coast. His expedition proving fruitless, he returned to Puerto Rico and eventually Spain. There, he won the court's approval to serve as military governor of Bimini and Florida in 1514.

It took Ponce de León seven years to raise a second expedition for Florida, and he finally sailed there in 1521. Landing at Charlotte Harbor on the peninsula's Gulf Coast, he encountered hostile members of the Seminole tribe and was wounded by an arrow. Retreating to Cuba, he died in Havana later that year.

Pontiac (c. 1720–1769)

Little is known about the early life and career of Pontiac, an Ottawa war leader most closely associated with a series of frontier attacks known as

Pontiac's Rebellion. Euro-American recreations of his life in the eighteenth and nineteenth centuries made him one of the country's most famous Native Americans, a symbol of fierce resistance to European colonization, and a leader of a racial struggle for the Great Lakes region.

Pontiac's legacy is more complex and interesting than the two-dimensional portrayals allow. It deserves to be understood within the context of mid-eighteenth-century America.

Setting the Stage: North America in 1760

The Great Lakes region was in a state of turmoil in 1760. The French had evacuated the region and were in the process of losing North America to the British entirely, leaving their thousands of native allies in the lurch. Native communities through the Ohio River Valley and the Great Lakes, many of whom were already refugees from earlier conflicts, struggled to come to grips with the new political reality of native life in America. There would no longer be two imperial powers that Native Americans could play off against one another. Furthermore, the region's native peoples had failed to create any sort of confederation that could prevent or slow Anglo-American expansion. The British who were moving into the region did not treat the native peoples on the same terms as the French had.

The British who occupied the former French forts and trading posts were under the orders of Major General Jeffery Amherst, who stopped reciprocal gifting and restricted the sale of powder. Native peoples had generally viewed the French as symbolic "fathers," but the British did not behave according to these long-established rules. They were intent on conquest.

At approximately the same time, Neolin, also known as the "Delaware prophet," began to preach a message of pan-American Indian unity and rejection of European culture that appealed to many Native Americans, including Pontiac. Neolin had a vision of heaven that contained only native peoples. He proclaimed that at one time, the native peoples had direct access to heaven, but that their path had been blocked because of their increasing contact with white people and dependence on them. Borrowing from Christianity, Neolin advocated a return to the "old ways." His message was taken up by many different Native Americans, however, and, in fact, led away from tradition.

Pontiac accepted the teachings of Neolin, but he modified them slightly: he focused Neolin's mistrust of white people in general more tightly on the British. He also mediated Neolin's desire for Native Americans to give up white ways. Pontiac was a war leader, to be sure, but he was also a deft politician, who was able to bring together different strands of anti-British sentiment.

Pontiac's Rebellion

Rising anti-British feeling among Native Americans allowed diverse groups of Senecas, Shawnees, Delawares, and various Algonquin villages to set aside former differences. In the winter of 1762, war belts traveled throughout Indian Country as Native Americans prepared for war against the British.

In the spring of 1763, war came. The Ottawa laid siege to Detroit, while other natives destroyed all of the British outposts in the Ohio River Valley. The native warriors failed to take the three largest British installations—at Detroit, Fort Niagara, and Pittsburgh—but they inflicted a great deal of real and psychological terror. By the end of the summer, they had killed several thousand settlers, traders, and British soldiers. When news of the situation reached London, Parliament sent reinforcements and passed the Proclamation Act, a last-ditch effort to avert conflict along the colonial frontier. The British had fought the native forces to a stalemate, and though sporadic fighting continued for a couple of years, no territory changed hands and the loss of life lessened considerably.

Both sides of the Anglo-Native American conflict resorted to brutal tactics during Pontiac's Rebellion. Pontiac seized a British captain under a flag of truce; an Ojibwe leader later tortured the captain to death as revenge for a nephew's killing. Jeffery Amherst, commander of British forces and a confirmed hater of Native Americans, ordered his soldiers not to take any prisoners; he also gained notoriety for sending smallpox-infected blankets into native villages.

The results of Pontiac's Rebellion were not decisive in favor of either the native peoples or the British. Native Americans had failed to evict the British from the Great Lakes and the Ohio River Valley, as the British retained their three key military strongholds. On the other hand, the British had set out to subjugate the Native Americans and subject them to colonial rule, and they had failed in that mission. Both sides gradually moved away from their hard-line positions (Amherst, for example, returned to England and was chastised for his brutality) and began to seek a meaningful, lasting peace in the years after the rebellion.

Pontiac's Life After the Rebellion

Pontiac's role in regional tribal affairs continued after the rebellion fizzled. Although he had lost influence among the native peoples near Detroit for failing to destroy the fort, he gained prestige elsewhere for his leadership abilities and political skills. In the Wabash and the Illinois country, for instance, he became an important man; tribes in these areas had no desire to settle with the British.

Pontiac traveled widely, enlisting new allies to resist British policies. Although he often claimed to represent the French, he more clearly represented Algonquin resistance to British colonial rule. Some of the British came to view Pontiac as possessing almost superhuman powers. After the Shawnees agreed to terms with the British in 1764, Pontiac began seriously to consider peace with the British.

Pontiac's reputation as a skillful negotiator increased when he mediated a dispute between the Kickapoo and the Shawnee. In 1765, the Kickapoo attacked a group of Shawnees who were acting as a British trader's escort, killing several of them. The Shawnee threatened to go to war over the incident, but the natives of the Illinois Country called in Pontiac to smooth over the differences between the groups. He did so masterfully, and in the process went from being a war leader to being a chief. Interestingly, the number of native peoples loosely allied with Pontiac increased after his famous rebellion.

Pontiac's reputation and power had grown, but he had fashioned himself as the leader of a vast native empire stretching across the current Midwest. In reality, his power was much more limited. Also, he began to behave recklessly and arrogantly, prompting a French trader to predict in 1766 that he would be dead within a year. This ominous prediction was not off by much.

Pontiac stabbed an Illinois leader, which set in motion the chain of events that would end his life. He lost influence among the Ottawa themselves, and, by 1768, he was living in exile among the Illinois. The most famous American Indian of his generation was without a home. In 1769, a nephew of a Peoria chief killed Pontiac in Cahokia, a French village near present-day East St. Louis.

Pontiac's life and death demonstrate the limits of chieftainship in the Great Lakes region in the 1760s. He was able to draw people to him with an anti-British message cobbled together from many different strains of thought. He took part in the cross-cultural revival/uprising that bears his name and, for a time, believed himself to be the leader of a gigantic Native American empire. Pontiac expanded his own role far beyond what was expected or even desired from an Ottawa war leader. In the end, his self-aggrandizement cost him his life.

Poor Richard's Almanack

Famous for such pithy sayings as "Early to bed and early to rise, makes a man healthy wealthy and wise," *Poor Richard's Almanack* was published annually by Benjamin Franklin from 1732 to 1758. Franklin began the almanac when, as a rising Philadelphia printer, he lost his lucrative almanac printing business to competitors. Franklin responded by creating his own almanac and selling it to the public under the name of Richard Saunders, also known as Poor Richard.

Almanacs were extremely important in colonial America and were surpassed in sales only by the Bible. They provided something valuable for everyone. A basic calendar helped avoid confusion over dates at a time when, because England had not yet joined other European countries in adopting the Gregorian calendar, colonial calendars disagreed with the calendars followed elsewhere. Almanacs included the phases of the moon and the changes in the tides (information needed by travelers and mariners) and forecast the weather for farmers while simultaneously—and sometimes controversially—giving astrological predictions and mysterious home remedies for various afflictions. Prosaic information such as the dates that court would be in session stood alongside entertaining pieces such as predictions of fantastic events, amusing sayings, and the occasional bawdy verse (or two). Though *Poor Richard* was not the most popular almanac in colonial America—its sales peaked at 10,000 per year versus the 50,000 to 60,000 sold by the leading publication—it did have a devoted following across the colonies and generated a healthy income for Franklin.

Much of the almanac's success stemmed from the popularity of Poor Richard. More than simply a pseudonym for Franklin, Poor Richard was a fully developed literary character, one of the many created by Franklin over his lifetime. Almanacs typically began with a preface expressing the warm greetings of the author, who presented himself as a polymath—an astrologer, mathematician, and all-around wise man rolled into one. Franklin used the prefaces to bring Poor Richard to life. In the first almanac, Poor Richard read the stars and predicted the death of rival almanac maker Titan Leeds, provoking a running controversy. When Leeds responded abusively, Poor Richard countered in the next almanac by claiming that since Leeds was always a gentleman he must be dead, with someone else shamefully writing the almanac under an assumed name. Franklin also entertained by offering readers a glimpse into Richard's squabbles with his wife, Bridget. The two characters exchanged humorous barbs from one almanac preface to another, with Richard complaining of his wife's pretensions to gentility and Bridget criticizing her husband's habit of airing her faults in public.

Benjamin Franklin's enormously popular *Poor Richard's Almanack*, published annually from 1732 to 1758, was full of homespun wisdom, pithy common sense, and practical information. (Brown Brothers, Sterling, Pennsylvania)

Over time, Franklin downplayed the comedy and increasingly turned to supplying practical knowledge. More and more, *Poor Richard* also encouraged the virtues of thrift and industry through proverbial wisdom. In 1748, Franklin expanded the almanac from twenty-four to thirty-six pages, changed the name to *Poor Richard Improved*, and allotted more space to essays providing useful information on topics such as farming techniques, cooking recipes and home remedies, money-making strategies, and especially science.

Occupied by other affairs, Franklin left publication of the almanac to others after 1758 (a version of *Poor Richard's Almanack* continued to appear long afterward). Franklin departed with one of his most famous performances. He created a new character, the sagacious Father Abraham, to expound the wisdom of Poor Richard on the value of thrift and industry. Encompassing the numerous proverbs on these virtues included in the almanac over the years, and presented in the form of "as Poor Richard says," this preface quickly achieved wild popularity. Reprinted profusely in America and abroad as "The Way to Wealth," it has been seen as the epitome of an American philosophy of material success and as a classic of American literature.

On the whole, much of what appeared in *Poor Richard's Almanack* was not original with Franklin, since he borrowed freely from others. Richard Saunders was the name of a deceased London almanac maker, and the moniker *Poor Richard* was taken from the title of another publication, *Poor Robin's Almanack*. The characters of Richard and Bridget as well as the trick of predicting his rival's death were patterned after the satiric writings of Jonathan Swift.

Even the famous aphorisms, although frequently seen as the insights of Franklin, usually expressed commonly known folk wisdom. Franklin, however, used his fine-tuned ear to give these sayings the perfect ring. For example, in Franklin's hands the saying "Fresh fish and new come guests smell, by that they are three days old" became the much more memorable "Fish & visitors stink in three days."

Population and Demographics

At the end of the sixteenth century, encouraged by the colonization of Ireland, England was interested in extending its reach. Another factor was that war with the Spanish and the expenses associated with colonizing Ireland had left the realm financially depleted.

Following the example of the French and Spanish, England subcontracted the work of colonization to a few highly motivated promoters, who became known as the West Country Men. These men included Sir Richard Grenville, Sir Francis Drake, and Sir Walter Raleigh, among others. The West Country Men secured investment by drawing attention to the serious problem of overpopulation that was plaguing England, especially the urban centers, at the time. England's population was 3 million in 1500, 4 million in 1600, and 5 million by 1650.

The constantly expanding gap between rich and poor, encouraged by critical legislation like the enclosure acts, which forced thousands of subsistence farmers into poverty and ultimately into the urban centers in an effort to find work, frightened the wealthy (a mere 5 percent of the population). The West Country Men sold the colonization plan on the basis of the theory that this growing population of poor people might well create problems that could not be controlled by legislation. Additionally, colonization would provide opportunity for all, while simultaneously lifting England's financial burdens by sending the poor overseas.

Early English colonization efforts also involved the West Indies. Two of the most pivotal settlements in the New World, however, were the Massachusetts Bay Colony and the Chesapeake Bay Colony, both of which continue to influence population distribution in America to this day.

Chesapeake Bay and the Middle Colonies

Initial voyages to the New World were generally unsuccessful. The first colonists were a mix of a few enthusiastic middle-class adventurers, looking for the vast wealth promised by the stories of Spanish expeditions, and a far larger proportion of lower-class emigrants seeking to escape the brutality of the English law code.

After an initial exploratory mission a year earlier, the first colony was established at Roanoke Island, in Virginia in 1586. This famed "Lost Colony" had vanished by the following year due to disease, trouble with indigenous peoples, the Spanish, and other problems.

The first successful Virginia colony was the settlement at Jamestown in 1607, but it also had serious problems getting started. Of 105 initial settlers, only thirty-two survived after the first seven months, the high mortality rate being attributed to starvation and disease. Aided by supplies from England, assistance from the native peoples, and a mandatory work program initiated by John Smith, the colony established agricultural success with the introduction of tobacco production, the single most influential factor in its population growth. Virginia would continue to lead the colonies in both population growth and wealth generation through the end of the eighteenth century.

By 1620, over 1,700 colonists had been shipped to Smith's Chesapeake Bay Colony. Of these, only 350 had survived. The early settlers were plagued by starvation due to failed get-rich-quick schemes; diseases including smallpox and malaria; and chronic troubles with native peoples. New settlers continued to arrive, but their life expectancy was only forty-five years.

Two major policy changes during this time transformed the Virginia colonies into successful enterprises. First, the near-bankrupt Virginia Company surrendered control of the lands and laborers to the colonists. The idea of private property was very attractive to members of the English middle class, who could not expect to own property in overcrowded London.

In addition, the Virginia Company initiated a program called "headright," which offered fifty acres of land to emigrants who could pay their own passage and an additional fifty acres for any servant they brought with them. This attracted a more stable and skilled middle class hoping to establish homesteads. By this time, communities had been established, and news of life in the New World had reached England. Later settlers had the benefit of knowing what lay ahead.

The native population of Virginia in 1607 was estimated at near 24,000. By 1669, it had dwindled to 2,000. Fear and frustration with the indigenous peoples inspired legislation to curb their numbers. Landowners were given license to shoot any Native Americans caught trespassing on their lands. Since the native peoples did not acknowledge land ownership, this was viewed by them as yet another unwarranted assault and provoked hostilities. Diseases, including smallpox and the common cold, for which they had no immunity, further culled the native population. Driven inland, coastal tribes, like the Pequot and the Paspahgh, steadily declined. Inland populations, however, continued to cause problems for the colonists through the eighteenth century.

Between 1620 and 1630, the tobacco boom inspired increased immigration, and the population grew rapidly. From a slim, near-starving 350 settlers in 1616, the population of Virginia exploded, reaching nearly 13,000 by midcentury. At this time, the mortality rate continued to be high. Hard work and

disease due to poor sanitation took 25 percent of the population yearly.

In 1650, African slaves comprised only 2 percent of the population. It was much cheaper for a Virginia farmer to purchase an indentured servant. Between 1625 and 1640, 15,000 indentured servants had immigrated to Virginia. As land became scarce due to the headright program and profits grew from tobacco, purchasing slaves became more desirable. Indentured servants would be set free and expect severance pay in the form of land, goods, and/or money. Slaves, on the other hand, were considered property. African slaves were also better accustomed to the demands of farm labor and the hot climate of the American South, and so made more cost-effective workers. By 1770, African slaves made up 13 percent of the population, and by the time of the American Revolution, slaves comprised 45 percent of Virginia's total population.

New Netherland in the Hudson River Valley and New Sweden in the Delaware River Valley did not experience the same growth rate as the more southern and northern colonies. Despite the relatively mild climates and fertile soil in these colonies, the Dutch and Swedish simply did not have the same impetus to leave their homes as did the English. In 1660, New Netherland had only 5,000 colonists, compared with 25,000 in Chesapeake Bay.

New England

Farther north, the first settlements of the Plymouth and Massachusetts Bay Colonies, experienced similar difficulties getting started but benefited from the cooler weather and faster-running waters, which provided a less hospitable environment for disease. The *Mayflower* carried religious "separatists," or Pilgrims, who had originally left England for Holland, but fearing its vulnerability to Spain and concerned about their children taking up Dutch ways, sought a new refuge in North America. Also on the *Mayflower* were Captain Miles Standish, the ships' officers and crew, indentured servants, and hired artisans; all totaled fewer than 150 people. A long, starving winter and disease killed half the settlers the first year.

Although the Plymouth Colony's initial growth was slower, the fact that the *Mayflower* colonists arrived in family units and shared a common faith that encouraged hard work and community allowed the population to grow naturally. This was augmented by a low, natural mortality rate—only 5 percent from disease—and a relatively long life expectancy of seventy years, if one survived childhood. The arrival of new settlers and the establishment of family farms whose goal was self-support created slow but steady growth. By 1630, about 1,500 colonists lived in the Plymouth Colony.

Between 1630 and 1640, the Great Migration brought many more families to New England. The most successful of the New England colonies was the Massachusetts Bay Colony. By 1660, Massachusetts was home to 20,000 inhabitants of a total New England population of 33,000.

Unlike the Southern colonies, emigrants to New England came seeking a combination of religious freedom and economic opportunity. The lack of a big cash crop like tobacco kept most New Englanders in comparatively modest lifestyles. Most servants came with the families they worked for in England. By 1700, less than 5 percent of the population was indentured and only 2 percent were slaves.

Continued Growth

The population of the American colonies continued to expand in all directions. From 1700 to 1775, population increased steadily at a rate of 3 percent per year. The biggest obstacles for the colonists were in some ways self-generated. Brutal policies with regard to the native peoples and political and legal favoritism for the wealthy and well-connected created an environment of fear and distrust. This motivated Native American hostility and caused dissension among the lower classes and slaves, especially early in settlement. It is interesting to consider how the population might have looked had the colonists attempted to assimilate rather than conquer.

The first American census was taken in 1790. The total population of the sixteen American colonies totaled 3,893,874. The most populous was Virginia, with a total population of 747,550, of which 292,627 were slaves. Pennsylvania followed, with a total population of 433,611, but only 3,707 of these were slaves. The least populous colony was Delaware, with just over 59,000 inhabitants, followed by Rhode Island with 69,112. Only three colonies—Massachusetts, Maine, and Vermont—were without slaves at the time of the census, as they had abolished the institution of slavery.

Population growth everywhere is driven by the ability of the inhabitants to sustain themselves, given available resources. The colonists brought with them a powerful entrepreneurial spirit and were driven by a self-determination that continues to inform the American consciousness to this day. The success and power of this country is rooted in these fundamental ideals.

We should keep in mind, however, that these ideals would not have sustained the colonists without the help of the native peoples. The Native Americans not only helped feed the starving and ill-prepared first settlers but also gave them their biggest cash crop in tobacco and with that the means to build a nation.

Portsmouth, New Hampshire

The earliest inhabitants on the site of Portsmouth were most likely band of Pigwacket and Piscataqua natives, and their first meetings with English traders and fisherman were largely peaceful exchanges. Early English forays into the region were sporadic and carried out by small parties, and, as such, did not pose a serious threat to native cultures. Natives along the coast served as middlemen between interior tribes and the English in a small-scale fur trade.

For most of its early history, New Hampshire was divided between Puritan immigrants, including some who had been exiled from the much larger Massachusetts Bay Colony, and a mix of adventurers, farmers, and fisherman who concentrated more on turning a profit than creating a utopian society. By 1640, there were four towns in the region that would become New Hampshire. In Strawberry Banke (later, Portsmouth), the older class of adventurers held sway, while Puritans controlled Exeter and Hampton. Hilton's Point (today's Dover) was home to a large population of fishermen, although the town's inhabitants shifted between Puritanism and the more worldly concerns of making money. Throughout the seventeenth century, the Puritan leadership of Massachusetts Bay claimed New Hampshire and tried to annex it—with help from inside the four towns—but, in 1679, the Crown declared the two colonies separate.

Portsmouth depended on Atlantic trade; for this reason, town life was very much oriented toward the sea. A flourishing trade developed in naval stores, and demand for New England's white pine masts and spars spiked in the years of maritime conflict between the English and the Dutch. Naval products were not the only way to make a living in Portsmouth. Farming remained key, and, as the local economy picked up, speculation in real estate also provided early settlers with a way to wealth.

Neighboring Puritans would criticize the Piscataqua River region for fostering a culture of degeneracy, drunkenness, and prostitution, but Portsmouth was not entirely devoid of religious feeling. On several occasions, leading Congregationalists tried to woo preachers from Massachusetts, and they, in turn tried, and failed to establish a church. There were too many people indifferent to religion, but in 1671, a Congregational Church was established.

The establishment of royal government brought a new set of problems to Portsmouth. The royal lieutenant governor, Edward Cranfield, succeeded only in alienating all of the people who had governed previously by punishing smugglers and attempting to curb the power of the church. Another experiment in colonial control, the short-lived Dominion of New England, further muddled the waters of colonial politics. Some of Portsmouth's leaders decided to rejoin Massachusetts, while others withheld payment of taxes to voice their concerns about such a move. Massachusetts's 1691 charter did not include the four New Hampshire towns, so the colony remained effectively independent.

Portsmouth continued to prosper in the eighteenth century as Britain emerged as the world's foremost naval power. Sail makers and rope manufacturers joined mast producers and lumber mills to drive the town's economy forward. Portsmouth became home to a large class of artisans who worked in and around the shipyards. Although local trade was important, Portsmouth remained intimately tied to the larger Atlantic world.

Ships made in New Hampshire took regular trading voyages to the West Indies and England. Farmers in the area surrounding Portsmouth had increased access to imported goods, including salt, sugar, molasses, and rum.

The upheavals of the eighteenth century had a profound effect on Portsmouth. As in other colonies, a small, but vocal Sons of Liberty movement rose in opposition to the Stamp Act of 1765. The Portsmouth Sons of Liberty pressured the stamp collector to resign, and the governor had little desire to provoke unrest by enforcing the act. The Townshend Duties that followed the Stamp Act were a different story, and royal officials and some Portsmouth residents did not oppose the taxes nearly strenuously enough for the Sons of Liberty.

The crisis leading up to the War for Independence revealed deep divisions in Portsmouth. The governor pressed for legislation to control unrest, but the colonial legislature ignored his requests, prompting him to adjourn, and later dissolve, the House of Representatives. The Portsmouth Committee of Correspondence was instrumental in coordinating colony-wide resistance to royal policies, as well as intercolony resistance.

In the wake of the fighting at Lexington and Concord, New Hampshire's already weak royal government fell apart. Meeting at Portsmouth, the House of Representatives took measures to separate from England. The war itself took place entirely outside of New Hampshire's borders, though the state did contribute significantly to the Revolutionary cause.

Potomac River

The Potomac River stretches 290 miles from western Maryland to the Chesapeake Bay, forming the present border between Virginia and Maryland for much of its length. As the river nears the Chesapeake, it forms the border between Washington, D.C., and Virginia. Including the north and south forks of its main tributary, the Shenandoah, the Potomac has two impassable cataracts (with the first only 10 miles north of Washington, D.C., and the second just above Cumberland, Maryland) and a drainage area of 5,960 square miles.

Although the water above the first cataract comes directly from the mountains, below that point the water is brackish for most of its length, becoming saltier as it nears the Chesapeake Bay. The average rise and fall of the tide is approximately 3 feet. A flourishing estuary, the Potomac River basin supports an enormous and extraordinarily diverse ecological system.

Europeans officially discovered the river in 1608, when Captain John Smith visited the northern Chesapeake and recorded the fact that the Powhatan name for the river was Patawomec, although the Chesapeake Bay and many of its tributaries had been explored unofficially by the Spanish as early as 1497. Various Native American nations of Algonquin origin plied the waters of the Potomac for countless generations before the arrival of the Europeans; they lived mainly along the banks of its 170-mile-long tidal reaches. Until 1634, the native peoples were the sole occupants of the banks and surrounding region of the Potomac, rather carelessly guarding their territory from the incursions of warrior raiding parties or European explorers and traders. Native villages and cornfields were scattered along the forested shores of both sides of the river, while the waters of the river itself attracted deer and offered a plentiful supply of oysters, fish, and waterfowl. After the settlement of Maryland in 1634, a constant stream of Europeans invaded the once idyllic waters of the Potomac.

The seventeenth and eighteenth centuries saw massive changes in population along the Potomac, as Native Americans were driven from the region and replaced by English colonists establishing vast tobacco plantations. The initial English settlements started below the first set of falls, but European settlement quickly expanded upriver and displaced the native peoples.

During these early years, in the absence of serviceable roads, the Potomac served as a highway from one settlement to another. The Potomac as a thoroughfare allowed for the reliable transportation of goods (particularly furs, grain, and tobacco) to the Chesapeake, with a return of people and supplies back into the interior. The passage of people upriver was especially important, since it provided a labor source for agriculture and allowed for the movement of settlers to interior regions such as the Ohio Country. Since cataracts obstructed passage directly to the Chesapeake, most transportation went only to and from the cataracts. People portaged their goods around these obstacles and picked up new transport on the other side.

No matter how high up the river one lived, waterfront property was essential, since the river was the only viable way to move goods. This situation made land near the banks particularly valuable and therefore expensive, with questions of ownership and usage sometimes leading to violent confrontations. When the Chesapeake and Ohio Canal bypassed the falls in 1828, direct navigation was opened up as far upstream as Cumberland, Maryland.

Powhatan (c. 1540–1618)

Powhatan was the most powerful man in eastern Virginia, or Tsenacommacah, when Jamestown was founded there in 1607. Powhatan was the father of

Pocahontas and the brother of Opechancanough, leader of the 1622 and 1644 attacks on English Virginia.

The term "Powhatan" may also refer to the Native Americans under the rule of Powhatan, the Powhatan Confederacy, or the specific village of Powhatan, near the site of present-day Richmond, Virginia. Most of the information we have concerning Powhatan and the related Native Americans of late-sixteenth- and early-seventeenth-century Virginia comes from archaeological studies of the region and first-hand accounts left behind by the English.

Powhatan was born between 1540 and 1550. He inherited the inner coastal plain between the James and Mattaponi Rivers. Conservative estimates place the number of people under Powhatan's control between 13,000 and 15,000. Powhatan was born in the village that came to be known as Powhatan.

Powhatan expanded his inheritance through conquest, taking villages along the James and York Rivers. In the years just prior to 1607, Powhatan was still conquering tribes farther to the east and north. His territory eventually stretched over much of eastern Virginia, based on the James, York, and Rappahannock Rivers, and included coastal tribes such as the Chesapeake. Powhatan tried to persuade neighboring villages by intimidating them with the threat of violence. If that failed, he was willing to use force to accomplish his goals. He is known to have conquered the Kecoughtan people, at the mouth of the James River, by 1596 or 1597. Power appears to have been more concentrated in Powhatan than was common among other Algonquian-speaking tribes, though he did possess the same kind of authority the English expected of a king, or that the Native American communities of the Southeast expected of their chiefs.

Politically, Powhatan ruled over about thirty separate villages; though all of the villages were linguistically similar, there were significant local variations in custom and culture. Each village had its own *werowance*, who governed with Powhatan's approval. If the local *werowance* ran afoul of Powhatan, he could be replaced with a more suitable man, in some cases a brother or son.

In addition to the political power Powhatan held over his various subjects, he was often personally connected to the villages. He solidified his hold on the region by marrying women from the various villages. Typically, Powhatan would keep a wife until she bore him a child. The wife and child would then return to their village of origin until Powhatan called for the child some years later. Powhatan was said to have a dozen temporary wives at once, and about a hundred by the time the English arrived at Jamestown. Powhatan's empire had been expanding throughout his adult life. The arrival of the English stemmed this tide and began a gradual reversal of the process.

When the English came to the peninsula between the James and York Rivers in 1607, they settled on the eastern edge of Powhatan's territory. This provoked two responses from the Powhatan people, who were evidently interested in determining the motives of the English and their military strength. A small party of English colonists ventured up the James River to Powhatan; they were warmly received by Parahunt, Powhatan's son, and seemed to establish friendly relations through the exchange of gifts and trade goods.

The powerful Algonquin chief Powhatan—portrayed here in Captain John Smith's Generall Historie of Virginia—headed a confederacy of native tribes in the Virginia Tidewater when English settlers established Jamestown in 1607. (Brown Brothers, Sterling, Pennsylvania)

At roughly the same time, 200 men had attacked the fort at Jamestown, killing ten colonists. Further minor assaults occurred over the span of a week. A tentative peace was reached when the Powhatan claimed that they had not made the attacks and that they could stop the aggressors. John Smith was captured and adopted into Powhatan society through a complex series of rituals, one of which involved being rescued from death by Pocahontas, which

was probably more of a performance than an actual near-execution.

Through the bond formed with John Smith, the military leader of the Jamestown colony, Powhatan believed he had adopted Jamestown as another subordinate village; in exchange for being allowed to remain in Virginia, the English would provide Powhatan with two cannons and a grindstone. The English did not understand the terms of the exchange and never provided the cannons or stone; they had their own ideas about colonization and conquest, most of which ran at cross-purposes with Powhatan's plans. Moreover, shortly after his adoption, John Smith left Virginia and Powhatan faced a new colonial government, one that understood even less clearly the terms of the agreement between Powhatan and Smith.

In 1608, Smith returned to Virginia, and in October, Powhatan demonstrated again his feelings of superiority toward the English. King James I had sent Powhatan some gifts and a crown, which Powhatan was invited to Jamestown to receive. Powhatan's alleged response was

if your king have sent me presents, I also am a king, and this [is] my land. Eight days I will stay to receive them. Your father is to come to me, not I to him; nor yet to your for fort: neither will I bite at such a bait.

The English ended up bringing the gifts to Powhatan, but problems arose when Powhatan was supposed to kneel to receive the crown. He steadfastly refused to submit to the English, and it was only by force that the English were able to bend Powhatan enough to place the crown on his head. Although English recorders speculated that Powhatan did not understand the importance of the crown or of kneeling to receive it, the more likely scenario is that Powhatan understood precisely what was going on and wanted no part of it.

Powhatan's problems were compounded by the fact that English settlements began to expand into the James River valley in 1610. Although Jamestown was weak and Powhatan could have wiped out the colony if he had chosen to do so, he did not—perhaps recognizing that the English could provide valuable assistance against other villages that Powhatan wanted to control. Jamestown also began to receive regular shipments of supplies and people from England.

The expansion of the colony was cause for alarm to Powhatan, and the first Anglo-Powhatan War, which lasted from 1610 to 1614, did little to slow the spread of the English into Powhatan's territory. Scholars have debated whether the actions of the Powhatan and the English actually constituted a state of war. It may be more accurate to say that the Anglo-Powhatan relationship soured and that both parties began to behave more aggressively, weakening the chances of any lasting peace between the two groups.

In 1610, Powhatan's personal life was also in crisis; he had apparently developed serious feelings for one of his wives and was refusing to send her and his child away, causing a small political incident. Hostilities between the English and the Powhatan ceased temporarily when Powhatan allowed his daughter Pocahontas to marry John Rolfe, a Virginia planter.

In the long run, the arrival of the English, their refusal to play by Powhatan's rules, and their eventual ability to feed themselves spelled disaster for Powhatan. The world into which he had been born was rapidly changing, and his people began to look elsewhere for answers. Opechancanough, his brother, assumed practical leadership of the Powhatan people, and Powhatan remained chief in title only.

The year 1617 brought more bad news. Pocahontas had died in England, and an epidemic, perhaps smallpox, wiped out many of the Powhatan. Retiring from public life, Powhatan died a year later in 1618. He had consolidated his power over most of eastern Virginia by the start of the seventeenth century but had watched his control slip away when he could not control the pace of English settlement.

Powhatan Confederacy

By the time the English established their colony at Jamestown in 1607, the native villages under the chief Powhatan numbered around thirty. These communities ranged across much of eastern Virginia.

Whether or not a confederacy existed under Powhatan's leadership has been a matter of contentious debate within the scholarly community. Some scholars insist that to use the term *confederacy* is improper, since Powhatan gained control of Virginia through violence and intimidation. Others argue that the term does not imply willing acceptance of Powhatan's rule, but rather that the villages were linked and their residents often acted in concert. Apart

from the squabble over terminology, it is more important to consider Powhatan culture and political structures and how these forces shaped the colonization of early Virginia.

Powhatan—born between 1540 and 1550—inherited the position of paramount chief and quickly expanded the territory under his control throughout the late sixteenth and early seventeenth centuries. Although he expanded his territory by conquest, his position was hardly analogous to that held by Queen Elizabeth I in England. He was not a monarch and did not have “subjects” in the traditional sense.

Powhatan's territory, Tsenacommacah, was split up into various districts. The districts were broken down into individual villages and other types of settlements. Each village had its own *werowance*, or chief, often the leader of the tribe before Powhatan arrived, who served at Powhatan's discretion. Powhatan also placed relatives—because of matrilineal inheritance these were more often siblings than children—in positions of power throughout his growing empire.

The nature of Powhatan society prevented the chief from making all but the largest strategic decisions in the governance of his people. Most affairs were handled at the local level by officials with tributary ties to Powhatan. Powhatan could also not act independently of the advice of his priests and councilors.

Chiefs did play large roles in Powhatan ceremonial life, presiding over the rituals that transformed boys into men and celebrated the ripening of the first of the year's corn. The chiefs' prominence in events like these, when they were honored by their wives, priests, and ordinary people, probably led the English who met them to inflate their role in their peoples' everyday lives. Chiefs also acted as stewards for tribal lands and fulfilled other political duties.

When the English arrived at Jamestown, Powhatan's empire in eastern Virginia was at the height of its power. The English had superior technology and were every bit as expansionist and nationalist as the Powhatan. They also had fewer people and a propensity for dying of starvation and disease. Moderate estimates place the Powhatan population at the time between 12,000 and 14,000; Powhatan tried to incorporate the English into his empire at the same time the English tried to expand theirs into Virginia.

Powhatan went about this task in a culturally specific way. His forces captured John Smith and took him on a tour of Powhatan territory. Smith met various native military and political leaders from throughout eastern Virginia, including Powhatan and his brother Opechancanough. While Smith's perceptions were colored by his Englishness, his writings show him to be a keen observer of Powhatan society.

Smith's life was threatened three times, finally and most famously by Powhatan. In this instance, one of Powhatan's daughters—Pocahontas—intervened. It is unclear whether the danger facing Smith was real or ritual, but most scholars believe he was the unknowing party to a ceremony through which Jamestown became another village tributary to Powhatan.

The English did not behave like subjects of Powhatan, however. They acted aggressively, pressing their Native American neighbors for food, fur, skins, and territory. As a result, the English and the Powhatan fought each other sporadically from 1610 to 1614. More destructive attacks, led by Opechancanough, occurred in 1622 and 1644.

The end of the Powhatan Confederacy is hard to place. Powhatan himself retired from public life in 1617 and died a year later. The paramount chieftancy was no longer in place as of 1650. Algonquin resistance to English colonization continued well into the seventeenth century, but white colonists overran their settlements almost entirely in the 1676 fighting associated with Bacon's Rebellion. By 1700, most Native Americans still remaining in Virginia lived on reservation-type lands.

Praying Towns

The term “praying towns” generally refers to Christian Native American villages set up by the Massachusetts Bay Colony between 1651 and 1674, although similar settlements were also created in the seventeenth century by the French in Canada and by native converts on Martha's Vineyard and in New Plymouth during the same period. Since Europeans believed in a close connection between church and state, those efforts brought colonial political influence along with the Gospel. In addition, missionaries believed that natives needed to be “civilized” as well as Christianized and created the mission towns for that purpose.

Puritan leaders in Massachusetts believed that mission communities would allow them to isolate and control potential converts in order to completely change native ways. Their envoy, Reverend John Eliot, learned Algonquian from a Pequot War captive. He was spurned in his first effort, preaching to the Massachusetts sachem, but, in 1647, he gained the support of Waban, head of Nonantum (modern Newton). The Puritan minister drew a curious and anxious crowd that grew at each of his five visits, and he convinced many to embrace “civilized” life and Protestantism. The native converts wore English clothes, cut their hair, and forsook many old customs.

In 1651, Waban and Eliot founded the first Praying Town, Natick, along the edge of Nipmuck territory. Natives who went to live there gained material assistance, education, and deeper connections to the colonists and their powerful god. Residents were required to follow a legal code designed to force them into English social and political patterns, including gender roles and monogamy. At the same time, pre-mission community leaders (like Waban) became leaders in the praying towns, and they enforced a traditional regard for community peace and stability, although Eliot and English magistrates supervised the native courts and reviewed all major decisions.

Not all Europeans demanded that native converts embrace wholesale change. The French Jesuits preferred to work with village leaders, and (after initial failures) the few mission towns that they set up were largely governed by native chiefs and did not require their members to give up all of their customs. Among the English, the Mayhews, who owned Martha's Vineyard, asked Christian Native Americans to remain loyal and pay tribute to their leaders. In New Plymouth, Richard Bourne and John Cotton followed the pattern set by Mayhew, permitting converts to maintain many traditions not tolerated by Eliot's followers. They gained enough support to create a Christian American Indian village at Mashpee and small churches scattered around Cape Cod and the villages west of Plymouth.

The praying towns helped spark King Philip's War. By 1674, Eliot had created a network of seven praying towns, and, that year, he brought Native American Christian leaders to seven Nipmuck towns farther west, alarming many native sachems. John Sassamon, one of Eliot's most prominent converts, became secretary to Metacom (King Philip) but earned his enmity when he warned the English that the Wampanoag sachem planned war. In February 1675, Sassamon's body was found under pond ice; those accused of his murder were three of Metacom's advisers, and their trial was clearly aimed at the sachem.

A few months later, the terrible war erupted. The “praying Indians” rejected Metacom and asked to join colonial forces, but they were deeply suspected of treachery and were confined to Deer Island in Boston Bay in the fall. Native Americans on Cape Cod and the Vineyard, on the other hand, managed to remain in their villages and out of the conflict. When Massachusetts finally approved native enlistment, the praying Indians contributed critical scouting skills. As the war ended, they were released from Deer Island.

Most of the few Native Americans who remained in Massachusetts soon resettled Natick and three other praying towns. These groups (ironically) increased their autonomy, particularly after Eliot died in 1690, and provincial laws barred the sale of their lands without permission of the assembly. A decade later, when Massachusetts annexed New Plymouth, the Native American residents of the praying towns there obtained similar protections. But throughout the eighteenth century, these remaining communities were battered by changes in the colonial economy; by the terrible effects of epidemics, alcoholism, and indebtedness; and by the loss of men in wars or to migratory labor.

The survivors adapted by teetering along the line between isolation from colonial society and culture and immersion in it, seeking to satisfy their needs in the new environment while maintaining critical boundaries against white settlers. By the time of the American Revolution, only a handful of such towns remained, led by native ministers, who preached in the Wampanoag language and were largely acculturated to English ways.

Precious Metals

The quest for gold and silver played a large role in the European colonization of the Americas, particularly in its earliest stages. Columbus noted in the diary of his first voyage that the people he met wore gold jewelry; this observation, combined with the mistaken belief that he had reached a land near Asia, led Ferdinand and Isabella to commission a second voyage.

Relations between the Taino and the Spaniards soon soured, when Columbus as governor instituted a tributary system whereby each Taino over the age of 14 was required to turn in a certain amount of gold. The Taino and other native peoples around the Gulf of Mexico died quickly in the Caribbean gold

mines.

From the enslaved mine workers, the Spanish heard rumors of an inland native empire with large stone cities and vast amounts of gold. In Mexico's central valley, Hernando Cortéz took it upon himself to conquer the Aztecs. Successful conquistadors were able to keep a good deal of their plunder, but a fifth had to go to the Spanish Crown. As a portent of troubles to come, French pirates also stole much of the gold that the Spanish had stolen from the Aztecs as it made its way toward Spain in 1523.

A similar war of conquest led by Pizarro felled the Inca empire of Peru. Within a matter of years, the extraction of precious metals, whether through plunder or mining, had filled Spanish treasure ships and made the Spanish empire the largest and most powerful in the world. In North America, many tribes managed to lure Spanish explorers out of their territory with fantastic tales of gold-rich civilizations. These rumors propelled Spanish exploration of vast areas of the interior, without, however, their discovering up the precious metals they sought.

Ultimately, silver mining, though less romantic than the search for gold, provided a surer source of income for Spain. By the end of the seventeenth century, imperial bureaucrats had begun to equate control over American resources with much of the success of Spain itself. This administrative shift coincided with the expansion of silver mining in New Spain (roughly Mexico) and Peru.

Silver mining had a dramatic impact on the form of Spanish society in the Americas. Significant numbers of African slaves were imported to work in the silver mines, and native people from all over New Spain were brought to mining towns, not only to mine ore, but also to provide various services that cropped up around the mines. The Spanish drew on medieval (and earlier) experience with mines on the Iberian Peninsula as they constructed a network of mines in the Americas. They also succeeded in tying the mining industry into the developing Spanish Atlantic commercial world.

The English were not immune to gold fever, and the earliest adventurers at Jamestown spent an inordinate amount of time searching for precious metals in the Chesapeake. This futile gold hunt was one factor that contributed to the Jamestown colony's disastrous early years.

From 1500 to 1650, the Spanish-American empire exported more than 180 tons of gold and 16,000 tons of silver, a fifth of which went to the Spanish Crown, accounting for 25 percent of its revenue. Spain's wealth drew attention from other European nations, which, according to the tenets of mercantilism, were in constant competition for a finite amount of trade. England, France, Holland, and Portugal all launched devastating raids on Spanish treasure ships. Piracy and smuggling spread newfound Spanish wealth throughout Europe. Francis Drake earned the favor of Sir Walter Raleigh and Queen Elizabeth I with his daring raids on Spanish treasure ships and Atlantic colonies.

The rapid influx of such a huge amount of hard currency also had mixed effects on the development of the Spanish economy at home. It experienced crippling inflation and slow growth in manufacturing relative to the rest of Europe. Dutch, English, and French manufacturers picked up the slack, ushering in a new period of economic prosperity.

Presbyterianism

The term "presbyterianism" can refer to many things. It can refer to a form of church government that is structured around elders (from the Greek *presbuteros*) or a theological system based on covenant theology and the sovereignty of God. It may also refer to a church movement that began with the Reformation and continues to the present day.

Although there are many heroes of the Continental Reformation, John Calvin is most widely associated with the Presbyterian form of church government. Calvin was a French theologian who fled to Geneva to avoid persecution. There, he took the helm of the Reformation in Switzerland and initiated his Presbyterian form of government in both church and state. Calvin envisioned two types of elders: (1) ruling elders, who had the primary task of governance; (2) teaching elders, who were to preach and teach the word of God. A systematic presentation of Calvin's doctrine can be found in his

Under Calvin's influence, Presbyterian theology emphasized God's sovereign reign over against his creation. God's righteousness and goodness were contrasted to man's utter depravity. In this view, apart from God's grace and love, humanity is unable to restore itself to wholeness. Only through God's predestination are individuals redeemed by the incarnation and atonement of Jesus Christ, God's only son. Just as Adam is the representative (federal head) of all of humanity in its sinfulness, Jesus Christ is the representative (federal head) of humanity's salvation.

John Knox, a Scot, spent some time with Calvin in Geneva. Although he did not possess Calvin's theological rigor and political genius, Knox was solely responsible for the introduction of Presbyterianism into Scotland. Knox wrote the first *Book of Discipline* and the *Directory of Worship*, which are the foundational texts for Presbyterian order and worship today. Knox also organized the first General Assembly in Scotland. Knox was the primary vehicle for the Reformation in Scotland, whereby Roman Catholicism was replaced by Presbyterianism in the latter part of the sixteenth century. Today, the Presbyterian movement in Scotland is known as the Church of Scotland.

Many Scots migrated to Ireland in early part of the seventeenth century and brought along their Presbyterian theology and form of church government. A presbytery was formed in Ulster in 1642, and by the end of the next decade, five presbyteries existed in Northern Ireland. In 1681, the presbytery of Laggan authorized Francis Makemie to receive a call to the ministry from a colony on the Eastern shore of Virginia. Later, in the early 1700s, economic, political, and religious hardships initiated a migration of Scots-Irish to America. By 1776, over 250,000 Scots-Irish had made the trip across the Atlantic to the New World. There was no specifically Presbyterian colony, but Presbyterian churches were scattered throughout the Middle colonies by the beginning of the nineteenth century.

Makemie, considered the founder of American Presbyterianism, was instrumental in forming the first presbytery of the early colonies around 1706. Presbyterianism was quickly being established in this region, so that, by 1717, four presbyteries gathered together to form the first Synod of New York and Philadelphia. In 1729, they adopted the Westminster Confession of Faith; in May 1789, four regional synods (New York and New Jersey, Philadelphia, Virginia, and the Carolinas) held their first general assembly. All of this occurred despite a schism that lasted from 1741 to 1758.

The First Presbyterian Church in Philadelphia is believed to have originated when founder Francis Makemie organized a congregation there in 1698. The building itself was erected in 1704 and redesigned with a classical temple facade in the last years of the century. (Yale University Art Gallery, New Haven, Connecticut/Bridgeman Art Library)

Although modern Presbyterians draw from a variety of confessions and catechisms, the Westminster Confession of Faith and Shorter and Longer Catechisms have remained at the center of American Presbyterianism. The impetus for the confession and catechisms came out of the restructuring of the Church of England by the Puritans. The desire was to have an English church that was Calvinistic in theology and Presbyterian in government.

The English Parliament convened the Westminster Assembly in 1643 in Westminster Abbey. This assembly comprised 121 ministers (or "divines"), ten members of the House of Lords, twenty members of the House of Commons, and eight influential Scotsmen. It was overwhelmingly Presbyterian. The assembly was convened to advise Parliament in the restructuring of the Church of England and to navigate a clear theological path among Catholicism, Arminianism, and Anabaptist tendencies. The confession and catechisms were delivered to Parliament in 1647. The assembly continued to meet until 1649. Although the work of the assembly never was fully adopted in England, the Scottish General Assembly accepted the Westminster Confession and Catechisms in 1647.

Today, there are several Presbyterian denominations in the United States. The largest is the Presbyterian Church (U.S.A), which has over 2.5 million members and over 11,000 congregations.

Prisons and Punishment

On the eve of the European invasion of North America, the various aboriginal nations each possessed their own set of laws and norms dictating proper behavior. Early European immigrants, including the Spanish, Dutch, French, and English, brought with them their distinct legal systems. English forms of punishment eventually predominated in most of North America, although colonial criminal law differed from justice in England in several important ways.

Criminal law in England at the beginning of the seventeenth century distinguished between serious crimes (felonies) and less serious offenses (misdemeanors). A wide variety of punishments existed in England, most which relied on the public shaming of offenders. The stocks, branding, whipping, and mutilation were imposed to embarrass the wrongdoer in the hope that he or she would not reoffend. The goal of punishment was not to reform prisoners but to frighten them into behaving lawfully. If the offender had committed only a minor offense, or if the convict was wealthy, a shaming punishment might not be imposed; instead, such offenders sometimes paid a fine.

Persistent offenders often faced transportation or the death penalty. From 1718 to 1775, the English courts sentenced approximately 50,000 felons to transportation, whereby they were shipped to America and sold as indentured servants. The English criminal law of the eighteenth century, often referred to as the "Bloody Code," prescribed capital punishment for upwards of 160 felonious offences by the 1760s, though many convicts received reprieves through benefit of clergy, transportation, or royal pardon.

Confinement in stocks, sometimes for extended periods, was a common punishment in colonial America, especially in Puritan New England. Those convicted of what were considered serious crimes, including moral offenses, were thus subjected to public shame and ridicule. (Brown Brothers, Sterling, Pennsylvania)

Punishment in America

In the first permanent English settlement at Jamestown, Virginia, established in 1607, the Virginia Company established a form of military law to enforce order. The "Lawes Divine, Morall, and Martiall" (1611) imposed harsh sanctions for many crimes, including economic crimes. For example, Virginia law imposed capital punishment for colonists who left without permission. Death was also the sanction for seamen who entered Virginia and sold goods at prices below those prescribed by the colony's government. After the creation of a House of Burgesses in 1619, Virginians ended their short but harsh experience with martial law.

The American colonies received the full spectrum of punishments employed in England. In small colonial communities, shaming punishments were especially important. Usually very public in nature, they were intended to cause humiliation such that the offender would not again step out of line. Warnings and fines were the weakest forms of punishment employed for small offenses. More serious crimes led to the use of the stocks, the pillory, or whipping. For offenders deemed likely to reoffend, communities employed more permanent shaming punishments such as mutilation (for example, the cutting off an offender's ear). Adulterers might be required to permanently wear the letter "A" denoting their crime, while a murderer could have an "M" branded on his or her hand. Repeat offenders could also be banished.

As in England, the death penalty was the ultimate form of punishment, with hanging the standard method of inflicting death. Murder and rape were usually capital crimes. The early leaders of the colonies also imposed the death penalty for several crimes that in England were not capital offenses, though, for the most part, the colonial courts actually hung few people for these offences. For example, Massachusetts made adultery a capital offense, but executions for adultery ended by the mid-seventeenth century. Similarly, the courts of New England ended hangings for buggery after 1673. Despite the extension of capital punishment to a few additional crimes, the colonies inflicted the death penalty less frequently than did authorities in England. Before 1660, Massachusetts executed fifteen people; and prior to the American Revolution, Pennsylvania executed only ninety-four people.

Incarceration was not an important form of punishment during the colonial period. The notion that separating criminals from the general population would lead to reform was a foreign idea; instead, it was thought important that a criminal should be exposed to the censure of his or her fellow citizens. Therefore, the penitentiary was not developed until the nineteenth century.

Jails, however, existed during the colonial period. For example, the first Boston jail opened in 1635. By 1776, each of the 14 counties in Massachusetts was required to have a jail. Jails were typically small and unimpressive structures that served a variety of functions. They held debtors and prisoners awaiting trial or punishment. Jails were intended to coerce compliance rather than to apply sanctions or rehabilitate. Living conditions in these jails were deplorable. Often overcrowded, they typically kept inmates in communal rooms with few amenities and little heat or food. Houses of correction supplemented jails, confining vagrants and paupers.

Punishment and Religion

Religion was an important feature of crime and punishment in colonial America, probably even more so than in England. Many of the religious dissenters

who migrated to America, such as the Puritans of New England and the Quakers of Pennsylvania, were especially interested in enforcing religious norms. Most of the colonies therefore made little distinction between sin and crime.

Early Puritan legal codes demonstrate the importance of religion in the justice system of colonial America. The 1648 *Laws and Liberties of Massachusetts* dictated that heresy and blasphemy were crimes, that Jesuits entering the colony were to be expelled, and that Anabaptists who continued to hold their beliefs were to be banished. In addition, Massachusetts had strong laws against Quakers, hanging two Quakers in 1659. The Sabbath was also taken seriously and enforced by the criminal law. Fines could be imposed for skipping church services, for example. The connection between religion and the criminal law was perhaps most graphically illustrated in the *Laws and Liberties of Massachusetts*, which included a Biblical citation supporting each of the code's capital offenses.

The courts acted as the secular arm of the churches, prosecuting individuals for sexual crimes such as adultery, sodomy, buggery, and fornication. The punishments for some of these crimes were serious, especially during the seventeenth century, when, for example, buggery was a capital offense in Puritan New England. Courts also frequently prosecuted less serious sexual offenses. Unmarried couples convicted of fornication were fined, whipped, or placed in stocks. Religious offenses also existed outside of New England. For example, Virginia imposed penalties for failing to attend church and applied the death penalty to those convicted of rape, sodomy, larceny, murder, or sacrilege.

The Demographics of Punishment

Most of those punished in colonial America were poor men. Offenders were typically laborers, slaves, servants, and poor freeholders, not ministers of religion or wealthy merchants. In eighteenth-century New York, men were accused in 94.4 percent of violent crimes and 73.9 percent of thefts. Similarly, in Massachusetts, women committed only 19.7 percent of serious crimes between 1673 and 1774. African American slaves consistently faced especially harsh punishment. In the South, masters and overseers brutally punished many minor offenses summarily on the plantation, frequently with the whip. Slaves also faced more frequent execution than whites; as a result, capital punishment was more common in the South than in the North. From 1706 to 1784, the courts of Virginia sentenced 555 slaves to death. Harsh punishment of slaves was not limited to the South, however; it also occurred in the North. For example, prosecutions for an alleged slave conspiracy in New York in 1741 led to the execution of over thirty slaves.

Women, while constituting a relatively low percentage of all offenders, were disproportionately punished for certain crimes. Most charges of infanticide, for example, were levied against women. Women were also more frequently charged with witchcraft than were men. Witchcraft was a crime in England, and the 1648 *Laws and Liberties of Massachusetts* made witchcraft a capital offense in the colony. Witchcraft trials were most common in the North, the most notorious being the 1692 witch trials in Salem, Massachusetts, when twenty people—most of whom were women—were executed.

By the eighteenth century, there was a shift away from directing punishment at sin. Colonial society was changing as immigrants continued to enter the colony and cities and towns grew in size. The old elites faced greater difficulties in controlling the population through traditional shaming punishments. The colonies increasingly placed more emphasis on property offenses and less on moral ones. In addition, in the years preceding the Revolution, English officials utilized the criminal law to limit political dissent; for example, officials used the law of treason to punish those who challenged English authority.

Changing ideas about the value and purposes of punishment stirred in the late eighteenth century, though the most significant alterations in punishment did not occur until after the American War for Independence. The Italian Marquis de Beccaria, in his 1766 *Essay on Crimes and Punishment*, reflected and encouraged a growing compassion for those convicted of wrongdoing. He also maintained that the certainty, not the severity, of punishment was the key to deterrence. Criticism from commentators such as the Englishman John Howard slowly emerged about the deplorable state of jails. Such ideas about punishment ultimately led to the construction of the large nineteenth-century American penitentiaries, where it was hoped that inmates would be reformed by serving long prison sentences.

Proclamation of 1763

At the conclusion of the French and Indian War, known as the Seven Years' War in Europe, the British extended their rule across French Canada and into Florida through the 1763 Treaty of Paris. In this process, they encountered significant problems with Native Americans, who had preferred French colonial policy and mistrusted British intentions.

After suppressing Pontiac's Rebellion, the British needed to formulate a plan to keep the peace on the frontier and maintain the loyalty of the Native Americans. The Proclamation of 1763 was issued by King George III on October 7 from his court in London on the advice of Secretary of State Lord Egremont and President of the Board of Trade Lord Shelburne. It attempted to mandate a solution to Native American mistrust and establish British rule over the new lands. A limit to settlers spreading over the Appalachians had already been implemented by Colonel Henry Boquet in 1761; that decision provided a useful model for the proclamation.

The proclamation formally annexed the French islands of Cape Breton and St. John's; expanded the colony of Georgia between the Altamaha River and St. Mary's; and set up four new imperial government units in East and West Florida, Quebec, and Grenada (the Caribbean Grenadines), including all the associated royal officials and their powers. Veterans of the French and Indian War were granted land, preferably in the three new continental British possessions, based on their ranks, ranging from field-grade officers receiving 5,000 acres to a private soldier's claim of 50 acres.

The proclamation also forbade further British settlement west of the Appalachians or beyond the headlands of the rivers flowing into the Atlantic Ocean, effectively keeping the white population on the East Coast. Those lands to the west were considered the possessions of the "Indians," and all but royal officials were forbidden to grant claims or to purchase any of it, as Native Americans were under the personal protection of the British monarch.

The proclamation stirred heated feelings amongst the colonists, many of whom had quickly taken advantage of the peace to buy up western land claims that were now worthless. Colonial celebrities—such as Washington, Franklin, George Mercer, and the Lee family—were heavily invested in land speculation in the rich Ohio Valley, and their fortunes suffered because of the royal decision.

Colonists believed that the king and his ministers wanted to keep the settlers close to the coastline because this made them easier to tax and police, although Shelburne hoped that the westward limit would help to encourage the settlement of Quebec and Florida. The colonists were also angered by the privileged position granted to Native Americans, including additional royal regulation of the fur trade and the prohibition of the sale of rum or rifled weapons to the tribes. Royal Indian agents threatened the trade conducted by colonists and cut off their ability to make quasi-legal land transactions.

For the British, the Proclamation of 1763 made good sense. It offered the tribes proof that Britain would honor its claims to essential hunting grounds and protect them from fraud and underhanded business dealings—both were much-missed protections under the French royal officials. Ideally, the proclamation also would encourage the colonists to settle in underpopulated areas of the Eastern seaboard before pushing inland to areas where there would likely be conflict with Native Americans.

The Proclamation of 1763 was meant as a temporary halt to colonial expansion, pending investigation and governmental regulation. It was followed up in 1764 by a more precise drawing of the western boundaries of the individual colonies, largely the work of the northern and southern Indian agents Sir William Johnson and John Bruce, along with elaborated rules for colonial dealings with Native Americans. The problem was that settlers already in the forbidden areas refused to leave, while new immigrants crossed the borders in spite of the proclamation, triggering continual problems with the tribes, as their promised lands were encroached on. More fraudulent deals also took place for the purchase of land.

The British responded by stepping up their presence in the former French chain of frontier forts and constructing more defensive works along the line of the proclamation. The expense of these fortifications, which seemed pointless to the colonists without the French as an enemy, triggered many of the tax demands that fueled the American Revolution.

Property and Property Rights

The concepts of property and property rights in colonial America reflected common law patterns established in England. Property was categorized as either real property or personal property. Simply put, real property was land, but it also included anything growing on, attached to, or erected on the land that could not easily be removed without causing injury to the land. All other property was considered "personalty," or personal property. Of the two categories of property, real property was given more economic and legal significance.

In 1290, England's Statute Emptores established the principle in common law that land should be freely alienable, allowing it to be transferred or conveyed from one person to another. This statute, along with subsequent legislation, was based on four separate theories: (1) land should be available for its highest and best use; (2) land owners should be able to sell property, utilizing the profits acquired therefrom; (3) land owners should be encouraged to make improvements to the land, but they will not do so if there is no opportunity to sell the property later for a profit; and (4) creditors should be able to reach the property interests of debtors who are in default.

There were three recognized restraints on alienation in common law: disabling restraints, forfeiture restraints, and promissory restraints. A disabling restraint prevented a person from receiving property, a grantee, from transferring his interest in that land to another. Any attempts to do so would be considered null and void. If land were subject to a forfeiture restraint, any attempt to transfer or convey the land would result in the land being forfeited by the present owner in favor of a previously appointed recipient. Additionally, a grantee could willingly enter into a promissory restraint in which he would promise not to transfer his interest in land.

Settlers in colonial America often placed additional restraints on the use and ownership of property. Landownership, when associated with community membership, required owners to utilize their land in a manner consistent with communal views of appropriate land use. In such cases, landowners ran the risk of losing the right to their property if they did not use the land in a manner deemed appropriate by the community in which they lived.

In many New England towns, for instance, individuals owning parcels of land within the town limits were required to erect structures on them on penalty of losing the land. Several colonies insisted that owners of land suitable for waterwheel sites build mills or risk losing the land to someone who was willing to construct a mill for the public good.

In New York City, landowners were subject to fines if they failed to remove poisonous or foul-smelling weeds from the areas surrounding the front door of their homes. In one New Hampshire town, landowners were required to cut down trees on their property that offended their neighbors. In contrast, residents of Pennsylvania were required to plant foliage to improve the aesthetic value of their property.

Individuals as Property Owners in Colonial America

Upon arriving in colonial America, English settlers found an abundance of fertile and inexpensive land that could be acquired quite easily. It would be inaccurate, however, to say that all people immigrating to the American colonies were able to own property of their own. The right to own property was often tied to one's religious beliefs, social status, race, and gender.

Availability and distribution of land was intertwined with political patronage and nepotism, and the stability of ownership was often precarious. Following the Spanish and Indian Wars, for example, higher taxes were imposed to cover the immense war debt. Small-scale Southern farmers were the hardest hit by this legislation. Finding it difficult to remain competitive in agricultural markets, they were forced to sell their holdings to large plantation owners at prices far below the land's actual value. The scene was thus set for the emergence of an economy based on elitist planters and tenant farming.

Regional differences also played a significant role on property ownership. In New England, where communal goals were elevated above the interests of the individual, land ownership bore a direct relationship to an individual's character. Land was sold only to a town's male residents, and then only if such men were able to pass religious and moral tests administered by the town fathers. Such tests were designed to ensure godliness among the town's inhabitants and to foster solidarity within the group. Still, land distribution in the New England colonies was perhaps the most comprehensive, providing the majority of male settlers the opportunity to own a share of the available land.

Immigrants to other colonies often did not find it as easy to become landowners. In agricultural regions like the colonies of Virginia and Maryland, indentured servitude was one way by which laborers could eventually acquire property of their own. Working six days a week, often ten or fourteen hours each day, the life of an indentured servant was a hard one. Like slaves, they could be disciplined or even sold by their masters, and they faced severe punishment if they attempted to run away. Once an indentured servant fulfilled his obligations, however, he might be rewarded with money, livestock, corn, tobacco, tools, and, sometimes, land of his own. Thus, indentured servitude afforded many men the opportunity for social and economic mobility.

There were two categories of individuals in colonial America who were prohibited from entering the world of property ownership and control of land: slaves and married women. Unlike indentured servants, Africans who were brought to the American colonies as slaves did not have the hope of earning their freedom and acquiring property of their own. Rather than earning the right to own individual property, they themselves were viewed as a commodity that could be bought and sold. Generations would pass before such individuals would gain their freedom by manumission or by buying their freedom from their masters. Only then would they be able to count themselves among other members of the landed population. There were some early examples of successful free blacks owning land, but these were exceptions.

Married women were also legally handicapped, unable to act independently of their husbands in matters of property ownership and control. Some legal protections of a woman's and her children's rights did apply on the death of the husband.

Property Rights within the Marital Relationship

The marital property system in British common law supported the interest of the patriarchal landed class to keep estates intact and under the control of a single male. Under this system, a married woman was to be supported and maintained, but she was not entitled, by and large, to exercise the power of ownership. Her property relationship to her husband was one of dependency. This is the marital property system that was adopted by the majority of states in America.

Under this system, a woman ceased to be considered a separate legal person at the time of marriage. Husband and wife were considered one, and that one was the husband. Except for clothes and ornaments, all personal property owned by the wife at the time of marriage or acquired thereafter, including her earnings (if any), became the property of her husband.

In addition, a husband had the right of possession to all his wife's lands during the marriage, including land acquired during the marriage. That right was alienable by the husband and reachable by his creditors. The wife also had the duty of rendering services within the home. In exchange for all of this, and

a marriage vow to obey her husband, the wife received the benefit of the husband's support and protection.

The wife's previously held real and personal property came under the husband's control upon marriage under what was termed an Estate by the Marital Right. After the marriage and until issue was born of the marriage, the husband was entitled to the use and occupation of the wife's land, as well as to the rents and profits that resulted, so long as the marriage was not dissolved by divorce or death.

Once live children were born to the marriage, the husband's estate in the land became one of "Estate by Curtesy." Should he survive his wife, he would enjoy use and benefit of the land for the duration of his life.

If a wife survived her husband, the control of her previously held property was returned to her. She also was entitled to dower, which amounted to one-third of all property that her husband had owned at any time during the marriage. In addition, she could be a beneficiary of his will, because such a bequest would not take effect until after his death, when she regained her legal existence as a single woman.

Prostitution

Commercialized vice appeared early in colonial America. Prostitution was most often connected to urban, maritime, and, especially, wartime societies. Prostitutes plied their trade individually in nearly every community, ranging from the large to the small. During times of war, it was common for prostitutes to follow the army, sometimes in groups as large as several hundred. Most of these prostitutes were probably widows who turned to selling themselves for lack of other employment, but the trade certainly attracted all types of women.

The patronage of ladies of pleasure encouraged the opening of disorderly, or bawdy, houses in most cities. Some towns like Boston were infamous for the number and openness of their bawdy houses. In addition, mariners' wives often worked the streets near Boston's waterfront.

In other cities, prostitution was limited to specific areas, like the platform at the Battery in Manhattan, where the streetwalkers were known to openly ply their trade. New York was said to have many prostitutes but no bawdy houses. In Charles Town, the many women of ill report, most of them cast-outs from England's Newgate prison, candidly approached men nightly on the streets.

There were many variations of the bawdy house. Dorcas Griffiths of Boston was caught operating a bawdy house in the back of a grocery store, using a liquor license as a cover. Also in Boston, for over twenty years, Hannah Dilley rented out rooms in her husband's house to whores and even procured work for them. Prudence Sherrald was able to run her bawdy house openly in Philadelphia, because city officials, military officers, and city elites commonly frequented it. Newport had the only establishment run by a black woman, a Madam Juniper. Elsewhere, it appears that bawdy houses were run exclusively by whites.

The men who frequented prostitutes were not limited to the lower sorts or to sailors and soldiers. Many respectable colonials consorted with these women. Lawyers, sea-officers, journeymen, gentlemen, merchants, apprentices, and various officers of the government patronized the most respectable bawdy houses in a town. The most notable (or rather notorious, considering the details he documented in his secret diary) person known to frequently associate with prostitutes was the famed diarist and planter, William Byrd II of Virginia. Even Increase Mather, son of the famous New England preacher Cotton Mather, was once caught during a raid at a Boston bawdy house.

In Puritan New England, legislative attempts to regulate disorderly conduct within private homes were difficult to enforce. Since employing a host of officials to keep close watch on each home and make presentments for each infraction was impossible, persecution depended on informers. Since the

indictment of prostitutes depended on an informer who would be exposing his own crime, however, legal prosecution of prostitutes was often frustrated. Unless prostitutes were caught in the act, officials generally charged them with entertaining of lewd, dissolute, and disorderly persons, or for pandering.

Prostitution plagued Boston from the 1650s onward, as documented by such early accounts as the prosecution of Alice Thomas and the mid-eighteenth-century trial of Hannah Dilley. In 1759, prostitution had become such a problem in Boston that officials received the authority to bind guilty women as indentured servants for up to five years.

Communities sometimes destructively rioted against houses of ill repute. A Boston mob destroyed a bawdy house in 1734, and this happened again in 1737, under the direction of some well-meaning magistrates. In New York, mobs routed prostitutes from various sections of the city numerous times in the colonial era.

Such attacks, efforts at regulation, and prosecution do not appear to have substantially curtailed the activities of prostitutes and disorderly houses. Prostitution was certainly one of the contaminants of urban life; however, it only touched a relatively small segment of the population.

Providence

Providence, Rhode Island, was founded in 1636 by the banished minister Roger Williams and a group of refugees from the Puritan Massachusetts Bay Colony. In the first half of the 1630s, Williams had been at the center of controversies in Boston, Plymouth, and Salem, where he broke with the Church of England. The Massachusetts legislature—still associated with the Anglican Church—tried to have him shipped off to England. Williams fled to Narragansett Bay, where, with the permission of the Narragansett sachems who controlled the land, he and a small band of followers founded Providence. Through the 1640s, the population of Providence remained under 500.

Spiritually speaking, Providence was not unique among New England settlements. The Plymouth Colony, for instance, had split from the Church of England. Providence remains fascinating because of its thoroughgoing critique of the way the Puritans conducted their religion. Church attendance was not compulsory, and the church could receive no support from the government. Williams believed that the church could remain pure only if it stayed away from community matters. Besides various sects of Puritanism, Providence was home to a fractious Baptist congregation as well.

Williams also admitted, which other Puritans could not, that the Narragansetts' religion was suitable to them and did not belong to a particularly foul category; he viewed indigenous religions as no worse than flawed versions of Christianity. During the eighteenth century, Providence, and Rhode Island in general, was home to a large number of small religious groups that had splintered from larger communities and each other over and over again. Not surprisingly, there has been a tendency to lift up Roger Williams as an early example of American separation of church and state, or a visionary in native-white relations.

Providence was governed in a very strange way for colonial America. According to a 1644 patent obtained by Roger Williams, settlers could form their own government, decide issues, and enact laws by majority vote as long as these laws did not run afoul of Parliament. Other groups, such as William Coddington's antinomian followers at Newport, disliked the arrangement. When Massachusetts Bay and Plymouth tried to annex the land, however, most English people in Rhode Island sided with Williams's patent. This did little to keep the colony from breaking apart into its original factions (Newport, Providence, and a few other settlements of Puritan outcasts). Williams's land policy, which included generous allotments for all newcomers, also fell apart when earlier generations of settlers complained.

The Baptist Meeting House, a landmark of colonial Providence, was constructed in 1744–1745. The congregation, organized by Roger Williams in 1639, is believed to be the first of its denomination in America. (Library of Congress, LC-USZ62-31789)

Throughout the seventeenth and into the eighteenth century, Providence struggled against other towns in Rhode Island over land. In the first decade of the eighteenth century, these controversies receded, and migration and cultivation increased throughout Rhode Island. In the 1680s, Rhode Island would become part of the Dominion of New England, which was administered by the British Crown under the auspices of Sir Edmund Andros.

During King Philip's War, which destroyed several English towns and all but destroyed the region's native peoples, the septuagenarian Roger Williams commanded a militia of fewer than thirty men while the other inhabitants of Providence fled south to Aquidneck Island and the relative safety of Newport. The warriors recognized that Williams was a good man and had never intended any harm to the area's native peoples, but King Philip's War was a complex and broad conflict, and the Narragansett spared Williams's negligible force and put Providence to the torch.

The economy of colonial Providence remained small but diverse. Merchants in Providence relied mainly on Boston and Newport, and later Philadelphia and New York, for access to goods and therefore were only peripherally a part of the growing Atlantic commerce. As roads extended into the backcountry, Providence's economy expanded beyond farming to commercial endeavors. The Brown family took the lead in this regard, launching trade with Bristol and London in the decades before the War for Independence. Water-powered mills also provided a measure of balance to the colonial economy.

While Newport was devastated by the Revolutionary War, Providence escaped relatively unscathed and took the lead in the new state's commerce. Still, Providence remained secondary to Boston, New York, and Philadelphia.

Pueblo

The Pueblo Indians describe their emergence from the underworld as having been like a maize shoot sprouting from the earth. Established in a number of compact settlements on the semiarid Colorado plateau of northern Arizona and New Mexico, the pueblo developed a society based on agriculture and distinctive arts and crafts held together by a comprehensive worldview and ceremonial system.

The men of every pueblo considered their town to be the center of the universe and placed the main kiva at the center of a sacred space that extended outward in the four cardinal directions, upward to the four skies, and downward to the underworld. Rain was their central preoccupation, but all forces were balanced and represented in Pueblo society. Maintaining that balance was the charge of the Pueblo people. The Pueblo form a nation in the Southwest, despite divisions based on location, ecology, language, and social institutions.

Dating back over 1,000 years, the Pueblo settlement at Acoma is one of the oldest surviving communities in what is now the United States. Despite their ancient presence in the region and their cultivated respect for continuity and tradition, the Pueblo's culture was not static. In the years prior to Spanish occupation, the Pueblo had learned to live in the region through raiding, war, immigration, and, most often, vast trade networks. When the Spanish arrived, the Pueblo people, who conceived of their society as unfolding according to a preordained plan, were thrown into disarray.

The first information Spaniards obtained concerning the Pueblo came from Álvaro Núñez Cabeza de Vaca's expedition, which traversed the area in 1528. Inspired by their accounts, Fray Marcos de Niza, accompanied by native guides and an African slave named Esteban, who had been with de Vaca, led an expedition into Pueblo territory. Met with hostility, the expedition returned to Mexico. Undeterred, the Spaniards launched another expedition under Francisco Vázquez de Coronado in 1542. Seeking vast riches, Coronado returned to Mexico disappointed, and no expedition visited the Pueblo for the next forty years.

Small Spanish expeditions returned to Pueblo territory by the 1580s; however, in 1598, Don Juan de Oñate led 400 Spaniards and Mexican Indians northward into the upper Rio Grande Valley. The stability of Pueblo society and culture, as well as Pueblo achievements in architecture, agriculture, and crafts, aroused Spanish admiration, but contact led to conflict.

Ill equipped for life in the Rio Arriba, the Spaniards placed heavy demands for food and tribute on the Pueblo people. This prompted rebellions by the Tompiro, Tiwa, and Acoma in December 1598. The Spaniards crushed the rebellions, and, for the next seventy years, the Pueblo toiled under an oppressive system, providing tribute and personal service to the Spaniards. Their settlements secure, the Spaniards dispatched missionaries to the various pueblos, where suppression of native religious practices emerged as a point of contention.

The Pueblo settlement at Acoma, New Mexico, is the oldest continuously inhabited community in the United States, dating back nearly 1,000 years. The mission church, seen here, was begun in 1629. (Denver Public Library, Western History Collection, Jesse Logan, N-67)

By 1680, the Pueblo had suffered droughts, overtaxing demands for tribute, increasing raids by their nomadic neighbors, and the suppression of their religion. Seeking to free themselves, they devised a plan to expel the Spanish from their territory. Pueblo leaders planned to (1) cut Santa Fe off from outlying communities, (2) send word to the Pueblo in the north and south of the fall of the capital, and (3) attack before the annual supplies from Mexico arrived in the territory. The revolt exploded throughout the Pueblo territory, resulting in the deaths of twenty-one of the thirty-three Franciscan friars there and 400 colonists. The remaining Spaniards fled back to Mexico. Thus, the revolt provided the Pueblo with an intermission of independence.

In 1692, just twelve years after their expulsion, the Spaniards returned with a new colonial system. Gone were the harsh tribute and labor demands, and the assaults on Pueblo religion were tempered by moderation. By 1700, the Pueblo and Spanish had developed a tenuous peace. The Pueblo became allies to the Spanish as raids from neighboring peoples increased in frequency. The Spanish ended the prohibition against trading guns, and enlisted the Pueblo in the defense of the occupied territories on the Rio Arriba.

The Pueblo peoples' desire for peace and harmony led them to declare truces during the summer and fall. During these truces, vast trading fairs were held among the Native Americans. Sensing an opportunity, the Spaniards gave government sanction to these fairs in an effort to open communication with the hostile groups.

Spanish protections ensured, the Pueblo began to recover some of their lost prosperity. By 1800, they had gained a secure position in provincial society.

Puerto Rico

As one of the first areas of the New World to be “discovered” by Spain, Puerto Rico has a long and complex colonial history. Christopher Columbus's party landed on the shores of *Burenquen* (or *Borinken*), as its native inhabitants called it, on November 18, 1493, during his second voyage in search of a western route to Asia.

At the time, the central Caribbean island was home to an estimated 70,000 Tainos, whose sedentary, agriculturally oriented society was organized around *cacicatos* or chiefdoms. Their immediate ancestors were the Arawak-speaking peoples of northern South America, who began settling the Caribbean archipelago some 500 years prior to the arrival of the Europeans.

Claiming the island for the Spanish Crown, the Europeans named it San Juan Bautista (Saint John the Baptist). Later, it was renamed Puerto Rico or Rich Port, in the mistaken belief that it contained vast quantities of mineral wealth.

In 1505, Vicente Yanéz Pinzón, captain of the *Niña*, one of the three caravels that accompanied Columbus on his first voyage to the Americas, secured a *capitulación* or agreement to undertake the colonization of Puerto Rico. However, the prospects of acquiring additional fame and riches elsewhere consumed most of his energies. He sent only a shipment of goats and pigs in preparation for a future settlement before his contract expired. Not much later, Juan Ponce de León, who gained royal benefaction by successfully putting down a native uprising at nearby Hispaniola (today the Dominican Republic and Haiti), began the Spanish colonization of the island.

Christopher Columbus landed on Puerto Rico on his second voyage to the New World in November 1493 and claimed the island for Spain. Natives called it *Borinquén*; Columbus dubbed it *San Juan Bautista*. This map dates to 1599. (Royal Commonwealth Society, London, United Kingdom/Bridgeman Art Library)

Ponce de León landed on the southwestern coast of Puerto Rico in 1508. From the start, the Spaniards sought out the *Borinqueños* for their knowledge of the island, especially for information about potential sources of gold. Relations quickly soured as the Iberians established *repartimientos* and *encomiendas*, dividing up the natives among themselves in order to expedite their conversion to Christianity and assure a steady supply of workers. Led by the *cacique* Agueybaná the Brave, the Taino rebelled against their oppressors in 1511 but failed to dislodge them. The subsequent destruction of their ecological base of survival—coupled with forced labor, epidemics, warfare, and deculturation—all but decimated the native inhabitants. Despite the demographic catastrophe, the southwestern villa of San Germán reported some 2,000 “Indians” at the start of the nineteenth century.

In the absence of indigenous workers, the Spaniards stepped up their requests for *licencias* or royal permits for importing the “more sturdy” Africans. Available figures show that enslaved Africans comprised the bulk of the island's work force as early as 1530. Over 6,000 were imported to Puerto Rico between 1540 and 1600 to work in military installations, private homes, alluvial mining, pearl fisheries, and *haciendas* or agricultural estates. Along with the Iberians and Amerindians, the Wolofs, Mandingas, Fulas, Fantis, Ashantis, Yorubas, and Congolese, among other African ethnic groups, also contributed significantly to Puerto Rico's multiethnic makeup.

Following the exhaustion of Puerto Rico's placer deposits, shortages of capital and labor crippled the colonial economy. The number of sugar mills in operation, for instance, shrank from eleven in 1582 to seven in the 1630s. Faced with declining fortunes, many of the resident Iberian colonists fled hastily to Mexico and Peru, hoping to start anew in the mainland mineral enclaves. Their exodus almost depopulated the island, which, by about 1650, was effectively on the fringes of Spanish exploration, trade, and immigration in the Americas. In fact, relatively few Spanish colonists immigrated to the Hispanic Caribbean between 1600 and the last third of the eighteenth century.

In 1700, Puerto Rico possessed an estimated 6,000 inhabitants, although it is likely that countless escaped slaves, illegal traders, castaways, and pirates eluded census takers by taking up residence on the periphery of Spanish colonial control. After the Bourbons came into power in Spain in 1701, the Spanish Crown became increasingly concerned about the scanty population, military weaknesses, and impoverished economic conditions in the Hispanic Caribbean. Although the region had been a political liability and a drain on the royal coffers, requiring annual subsidies from the treasury of New Spain, the Crown considered it a key strategic link in the imperial order. The Bourbons gradually restored Spanish authority in Puerto Rico during the second half of the eighteenth century by revamping its defenses, congregating the dispersed population into towns, encouraging immigration (including slave trading), redistributing land among commercial farmers, fostering the production of cash crops, and promoting commerce.

As a result of these changes, Puerto Rico's population swelled from about 45,000 in 1765 to 136,000 in 1794. During the same interval, the number of enslaved Africans tripled from 5,037 to 17,508. These developments helped set the stage for Puerto Rico's gradual transition from a military post and penal colony of subsistence farmers to a leading exporter of tropical staples, especially sugar and coffee, in the next century.

Puritanism

Puritanism was not a social, political, or economic movement. Rather Puritanism was an attempt by Protestants in the sixteenth and seventeenth centuries to reform and *purify* the Church of England based on their understanding and application of scripture.

The sixteenth century was a time of great political and social change, and these changes dovetailed with religious life in England. Certainly, the movement had social, political, and economic repercussions and therefore cannot be seen solely as a matter of religion. Puritanism can be divided into two branches: (1) English Puritanism, which aimed to reform the Church of England, bringing it more into line with Presbyterian theology and church polity; and (2) American Puritanism, which transported the ideals and aspirations of the movement to the New World.

English Puritanism

As a reform movement, Puritanism had its roots in the earth-shaking German and Swiss reformations of Martin Luther, Ulrich Zwingli, and John Calvin. These three religious figures spoke out against the papal abuse of authority and were in favor of a return to the biblical understanding of church and church governance. King Henry VIII broke formal ties with the Roman Catholic Church because the papacy was unwilling to annul his marriage to Catherine of Aragon, his Spanish wife, who had been unable to give him an heir. In 1534, the English Parliament, in the Act of Supremacy, established the Church of England and appointed the king as the earthly head of the church.

"Puritan" was originally a derogatory term for sixteenth-century separatists from the Church of England, who called for greater purity in faith and politics; they later adopted the name themselves. American Puritans founded their theocratic settlement as "a model of Christian charity." (New York Historical Society, New York/Bridgeman Art Library)

Henry VIII died in 1547 and his son Edward took the throne. Archbishop Thomas Cranmer instituted church policy and oversaw spiritual matters in England. Cranmer revised the prayer book, permitted clergy to marry, published a doctrinal statement called the Forty-Two Articles, and generally initiated Protestant reform.

The death of King Edward VI in 1553 brought his half-sister Mary to the throne. A devout Catholic, she was determined to bring Roman Catholicism back to England. For her brutality in dealing with Protestants who resisted her, she earned the nickname "Bloody Mary." It is reported that in her reign she martyred nearly 300 reformers, including women, children, and even expecting mothers. Archbishop Cranmer was burned at the stake on March 21, 1556. Many Protestants fled to the Continent, especially Geneva, and were influenced by Calvin's preaching. After Mary's rule came to an end in 1558 and her sister Elizabeth took the throne, these Protestants brought Calvin's theology back to England.

Queen Elizabeth I tried to steer England's religious life carefully between Romanism and Protestantism, in the tradition of King Henry VIII. This

ecclesiastical diplomacy is often called the Elizabethan Settlement. Elizabeth's first order of business was to reinstate Henry's Act of Supremacy and Act of Uniformity in 1559. Elizabeth established herself as the only supreme head of the church and ordered the *Book of Common Prayer*, with a few concessions for Catholics, back into worship services. Unfortunately, this only had the effect of alienating both religious groups. The Catholic Church excommunicated her in 1570. It is at this point that we see the emergence of Puritans, who were protesting relics of Romanism still found in the Church of England. In 1572, some anonymous Puritans circulated a document entitled *Admonition to Parliament*, demanding that England's religious polity be purified of all Romanism and established as Presbyterian, not Episcopalian. Elizabeth appointed Matthew Parker as Archbishop of Canterbury to suppress the Puritan movement and maintain uniformity in her church. Elizabeth's sovereign rule came to an end in 1603 and James I took the throne.

In 1604, King James I called the Hampton Court Conference to discuss the Church of England. James I had been raised a Presbyterian, but to everyone's amazement he was sympathetic to the Episcopalian form of church government because it elevated the king. This frustrated Puritan reformers; in addition, by 1604, James I was requiring all pastors to subscribe to the Thirty-Nine Articles (a shortened version of the Forty-Two Articles). James I is best known for having sponsored a leading English translation of the Bible, the King James Version in 1611. The first group of Puritan dissidents left England in September 1620, sailing on the *Mayflower* to the New World in hopes of establishing a theologically and politically *pure* church.

Succeeding James I was his son, King Charles I. Charles I made William Laud Archbishop of Canterbury, and Laud re-established and enforced a fixed standard of worship. Laud also initiated the Star Chamber, which suppressed the Puritans and the Calvinist doctrines. This was more than many Puritans could bear, and a second group left for the Massachusetts Bay Colony in 1630. Laud and Charles I also attempted to impose their ecclesiastical restrictions on the Scots. This inflamed the Scots' Presbyterian sympathies. In 1638, they formed a National Covenant that pledged the Church of Scotland to Presbyterianism. Civil War broke out in England in 1642 and eventually Charles I and the Church of England were defeated. Charles I was executed in 1649. For a short time, Puritans were in control of church life in England. It was during this period that the Westminster Assembly of 1643 was convened by the Long Parliament to reform the Church of England by writing the Westminster Confession of Faith and the Westminster Catechisms.

Oliver Cromwell was thrust into the political spotlight by his army. Four years after Charles I's death, Cromwell dismissed Parliament and made himself Lord Protector of England. For a moment, a Puritan Commonwealth was firmly established in place of the monarchy. A group known as Triers was set up by Cromwell to examine clergy for their fitness for the ministry. Cromwell governed the church for only seven years, until his death in 1658. Charles II returned from exile in Ireland and restored the monarchy to England in 1660.

The Savoy Conference of 1661 was convened to rewrite the *Book of Common Prayer*. About twelve Anglicans and twelve Presbyterians, plus a handful of assessors, met in vain to revise the text. Very few concessions were made, especially to Richard Baxter's desire for an alternative service book and for the ordination of Presbyterian ministers. In 1662, King Charles II sanctioned the fourth Act of Uniformity, which forever committed England to the *Book of Common Prayer* and the Episcopal form of church government.

American Puritanism

The first group of Puritans, or Pilgrims, landed in Plymouth (modern-day Massachusetts) on December 20, 1620, and established the Plymouth Colony in New England. Upon landing, forty-one persons composed The Mayflower Compact, which was a religious and social covenant that ordered religious and political life in the Plymouth. William Brewster acted as their ruling elder and teacher, William Bradford as their governor, and Miles Standish as their military leader. That year, the harsh winter killed half of the original group.

This group of Puritans is known as the separatists, or independents, because they separated from the Church of England. They saw the established church as corrupt and impure and saw themselves as isolationists, because they wanted to isolate themselves from those outside of their covenant community.

The area north of Plymouth, in Salem, was settled by a group of Puritans who were not concerned about separating themselves from the Church of England but rather wanted to remain united to England and to reform the church from within. They were able to secure a charter from King Charles I, which enabled them, in a sense, to incorporate their group as a business, to occupy a territory, and to form a civil court to rule. On October 29, 1629, the Massachusetts Bay Company was inaugurated with the election of company officers. John Winthrop was elected as governor. In March 1630, Winthrop and a group of about 1,000 settlers left England for the New World. While aboard the *Arabella*, Winthrop addressed his fellow settlers and admonished them to enter into a covenant with God to participate in and maintain a godly community. The hope for this community was to establish an English populace in America. Salem proved to be an inadequate center for the commonwealth, so Winthrop tried setting up a civil center in Charles Town before finally settling on Boston.

The first winter was uncommonly cold and nearly 200 settlers died. In the spring, another 200 returned to England. Yet the theological and ideological hope of the New World was impressively inviting to English Puritans, so that by 1640 more than 18,000 dissidents had made the voyage across the Atlantic.

In this early stage of American Puritanism, the political structure was primarily theocratic. Only church members could vote and hold civil office. Despite having suffered religion persecution in England, both the Puritans and Pilgrims did not practice religious toleration. This was to protect the covenant community from outside influences and competing theologies and ideologies. Baptists, Quakers, and eventually, in some regions, Catholics were restricted and censured.

The Puritans valued education next to religion. As early as 1636, they founded a college at Cambridge that eventually became Harvard University. In 1647, the General Court of the Massachusetts Bay Company passed the Old Deluder Satan Act, which required townships of fifty or more families to appoint a teacher who was to teach all children to write and read. Townships of 100 or more families were to establish a grammar school to prepare youth for the university.

Puritan Theology

One of the hallmarks of Puritanism is the theological theme of transformation. At the center of the Puritan idea was the impetus to transform the Church

of England by purifying her of all ungodliness. This included transforming the liturgy, prayer books, worship, and government.

William Perkins was one of the first notable theologians to write extensively about the transformation of English religious and social life during the reign of Queen Elizabeth I. Perkins was a great influence on William Ames, who picked up where Perkins left off by writing about the transformation of church polity. Ames also is well known for his refutation of Roman Catholic criticisms of the Protestant Reformation. Two of Ames's greatest works are *The Marrow of Theology* (1623) and *Cases of Conscience* (1630).

Commitment to the written and preached Word of God, as presented in the Holy Scriptures, is not only a characteristic of the Reformation but is honed and sharpened in the Puritan movement. Preachers such as Richard Sibbes, Thomas Goodwin, and John Owen brought Puritan theology and ideals to the populace. Puritans believe that the Bible is the ultimate authority of the church and the life of the believer. This may have been in reaction to the Catholic notion that the papacy is the earthly authority of the Church. Either way, the Bible played the dominate role in shaping the life and thought, law and practice of Puritan magistrates, clergy and laity.

Puritans placed theological emphasis on a personal conversion experience. This was one way in which church officers could tell the redeemed, or elect, from those not redeemed. To become a member of Puritan church one would have to testify to one's personal conversion and give evidence of true repentance, the turning from sin to God. In Puritan America this became of prime importance, because church membership was a prerequisite to voting and holding public office. Puritans were particularly interested in proving that the individual's conversion was predetermined by God, not achieved by themselves. Theologically speaking, the believer was elected, or chosen, by God to be saved.

Richard Baxter was probably the greatest pastor and evangelist of the Puritan movement. He is noted as having been instrumental in the conversion of an entire town, Worcestershire, England. Baxter was too poor to attend university, yet he published 186 books and became known as one of the movement's greatest thinkers. Not only was he remembered for his fidelity as a pastor, but he also was known for his commitment to church unity and peace; he sought to find a middle ground amid some of the movement's greatest theological controversies. Baxter spent time in prison under James II; he was released and survived the Revolution of 1688.

The second wave of immigration to America in the early 1600s did little to boost church membership and attendance in the Bay Colony. In fact, by 1650, only about 17 percent of those living in the colony were members of a church. Part of this was due to the Puritans' insistence on the articulation of a personal conversion experience for church membership. As a means of boosting membership roles and to define baptism, Puritans allowed for partial membership (called the Half-way Covenant). Basically, they permitted the baptism of children of parents who had been baptized yet were not full members of a church. These children and their parents were half-members and were subject to the governance of the church but could not vote or participate in the Lord's Supper.

A Puritan was expected to exhibit certain evidences of salvation. One of these was the pursuit of holy living according to the commandments of Scripture. A pious life was sure evidence of a believer's salvation. For example, the Lord's Day (Sabbath) was set aside for the worship of God and the fellowship of believers. Businesses and recreational activities ceased on Sundays. Puritans were also expected to devote themselves to daily prayer and the reading of Scripture. Two mechanisms for purifying the community were the practice of self-examination and the confessing of one's sins to another believer, sometimes in a conference or meeting.

The Puritans had a sophisticated system not only of personal ethics but also of social ethics and communal living. At the center of most Puritan towns would be a common area and meetinghouse, the latter typically used for religious worship and business meetings. The idea was to provide space where people could get together, commune, and promote the common good.

Puritans were also asked to covenant or contract with one another. This was done to promote the notion that individuals do not exist as islands but rather in relation to each other. By covenanting with God and each other, Puritans were encouraged to love and care for one another by practicing wise stewardship of their wealth and material possessions.

Closely tied to charitable living was the Puritan emphasis on vocation and calling from God. People living in a community were believed to be called by God to provide a particular function or service in the community. Puritans were admonished to live out their religious convictions in their work. This is sometimes referred to as the Puritan work ethic. Everyone had a function in society and everyone was responsible for supporting and upholding those in need.

Lasting Impressions

John Owen is said to have been the greatest systematic theological thinker of the Puritan movement. He was an adviser to Oliver Cromwell, who in 1651 made him dean of Christ Church and later vice-chancellor of Oxford University. Not only did Owen sit on England's parliament, he was one of Cromwell's Triers and a participant of the Savoy Conference. Jonathan Edwards also influenced New England theology. He wrote *The Freedom of the Will* (1754) and *Original Sin* (1758), which defended the idea of God's sovereign act in the salvation of the individual. John Milton (*Paradise Lost*) and John Bunyan (*The Pilgrim's Progress*) are two noted Puritan authors who put the movement's ideals into prose and poetry.

By the dawn of the eighteenth century, Puritanism was winding down. War with Native Americans, the influx of other Protestant and Catholic settlers, issues of religious freedom, the Salem witch trials, and many other issues all contributed to the weakening of the Puritan ideal in New England. Puritanism lives on today in the theology and ideology of the Reformed, Presbyterian, and Congregational Churches around the world.

Quakers

Starting in the late 1680s, Quakers began to migrate to the British North American colonies in large numbers. By the middle of the eighteenth century, they had become one of the most influential Protestant sects in the New World. Their struggle for religious liberty in Britain and New England, their work in establishing the colonies of New Jersey and Pennsylvania, and their protests against slavery gave them a prominent role in shaping American political culture and social mores.

The English Civil War and Interregnum (1642–1660) spurred the creation of new religious sects, having been energized by far-reaching debates over political and religious authority in Britain. This included such transitory groups as the Seekers, the Ranters, and the Fifth Monarchy Men but also groups soon to become a permanent part of English Protestantism, namely Baptists and Quakers.

The Quakers grew out of the radical wing of Puritanism, a movement that sought a thorough reform of the Church of England along Calvinist lines. Puritans, and later Quakers, stressed liturgical simplicity, personal self-discipline, and the work of the Holy Spirit. Quakers departed from the Puritans on the means by which the Holy Spirit accomplishes this work. Puritans held that the Spirit works principally through Scripture, while Quakers thought the Spirit could communicate directly. Soon, Quakers came to understand the Spirit as an inner light given to believers to guide them along their spiritual journey. Without creeds, churches, or paid clergymen, Quakers sought to recreate the primitive Christianity of the New Testament in seventeenth-century England.

Quakers found early converts among separatist Puritans and Baptists in the English North and West Country, Wales, and the cities of London and Bristol. Separatist Puritans in Nottinghamshire, Leicestershire, and Derbyshire were among the first to exhibit traits that would come to be associated with Quakerism in the 1650s, which included spontaneous meetings of believers driven to heights of spiritual ecstasy by the Holy Spirit. These men and women referred to themselves as “friends,” thus giving the movement its eventual name, the Religious Society of Friends.

Quakerism was spread through these counties in the English midlands and northwest by such itinerant ministers as George Fox, William Dewsbury, and James Naylor. In the hands of George Fox, as recorded in his influential *Journal*, the movement acquired many of its distinctive beliefs and practices. Fox understood the Christian faith to preclude paying homage to presumed superiors, so Quakers were enjoined to use *thee* and *thou* in addressing everyone, regardless of social position, and to refuse to tip their hats to the rich, the well born, and the powerful. Also, Quakers were to dress and act in a plain style, lest anyone show the sin of pride through refinement in clothing and demeanor.

These early teachers brought Quakerism into ill repute among Anglicans, since they echoed the social and economic radicalism of civil war groups such as Levellers and Diggers. Quakers responded to their critics by channeling the movement through a system of weekly, monthly, quarterly, and yearly meetings and winning strategic converts among the gentry and nobility. Notably, meetings for business involved both men and women, and their acceptance of the spiritual authority of women became a Quaker distinction. Margaret Fell and William Penn provided examples of affluent, well-born men and women who could practice Quakerism while nevertheless preserving the fabric of the English social order. In fact, William Penn's role in organizing the colonies of West New Jersey and Pennsylvania testified to a new outlook within the movement, one geared toward building institutions and contributing to the development of the English colonial system.

Quakers in the Colonies

Quakers actually entered the colonies much earlier than 1682, the traditional founding date for Pennsylvania. At the movement's inception, in the early 1650s, Quakers came to New England in an effort to protest the residual religious “forms” that Puritans allegedly carried with them to Massachusetts Bay, Connecticut, and Plymouth Colony. Like their English counterparts, colonial Quakers accused the Puritans of supporting a hireling clergy, practicing

idolatry in the form of images and altarpieces, and encouraging spiritual deadness through written creeds and theologically sophisticated sermons.

Officials in New England persecuted Quakers through imprisonment, banishment, and execution, most spectacularly in Massachusetts Bay between 1659 and 1661, when four Quakers were hanged. Many Quakers found refuge in Rhode Island, where Roger Williams had established a haven for persecuted sectarians and dissenters ever since his own banishment from Massachusetts Bay over twenty years earlier. But the main body of colonial Quakerism was centered on the Delaware Valley region, as large numbers of persecuted Quakers arrived in the 1680s and 1690s to help realize William Penn's vision of a "holy experiment" in the New World.

In 1681, Pennsylvania Quakers organized the Philadelphia Yearly Meeting. This meeting was composed of representatives from lower-level weekly, monthly, and quarterly meetings. Thus, the Quaker form of church government most closely resembled the presbyterian system advocated by English Puritan reformers in the 1640s. The Philadelphia Yearly Meeting took up weighty issues of policy for the expatriate Quaker community, including the issues of wealth and worldliness, Quaker and non-Quaker intermarriage, war and peace, and slavery. The advices of the yearly meeting stand as a record of Quaker engagement with the world, a catalogue of the Quaker struggle to resolve several key tensions that emerged within the sect. These efforts entailed an ongoing battle to bridge the gulf between the inward and outward aspects of life and to create social standards within a sect that otherwise stressed individual conscience. Friends received these advices in their monthly meetings and sometimes used them as instruments of discipline for errant followers.

Discipline aside, Pennsylvania Quakers actively promoted the principles of religious freedom and toleration and worked to eliminate forms of oppression that they believed violated the teachings of Jesus. Penn's early charters for the colonies, such as the West Jersey Concessions and the Frame of Government of 1682 (Pennsylvania), provided for freedom of religion. This placed Penn in rare company in seventeenth-century England as a lawmaker committed to a written constitution enshrining the principle of religious toleration for all sectarians and dissenters. Gradually the idea of religious toleration gained traction, leading to the Act of Toleration (1689) in England and maturing in the U.S. Constitution's First Amendment guarantee of religious liberty.

The Quaker-led campaign against religious oppression dovetailed with their campaign against war. Quakers believed that war stemmed from a lust for power. They also stood against oath taking of any sort, which complicated their relationship to the state in general.

By the 1660s, Quakers had developed a Peace Testimony that forbade followers from participating in war or supporting it in any way. This position interfered with their efforts to provide for the defense of the colony of Pennsylvania during the War of the Spanish Succession, when French raiding parties threatened coastal and estuary settlements along the Atlantic seaboard.

Finally, in 1756, the Peace Testimony prompted many Quaker legislators to withdraw from the Pennsylvania Assembly so that the colonial government could prepare unimpeded for another war with France. As such, the Quaker principle of pacifism rendered the sect a minority party in the legislature for the first time since the start of the eighteenth century, and there it would remain for the rest of the colonial period.

The "meeting" is the heart of Quaker practice. The term is used to designate the gathering of adherents for worship, monthly congregational meetings for fellowship and the transaction of business, and the high-level administrative unit of the Society of Friends. (Museum of Fine Arts, Boston/Bridgeman Art Library)

Quakers and Social Reform

But Quakers did not withdraw from public life altogether. They remained at the forefront of social reform despite their abdication from power in Pennsylvania government. They were instrumental in developing state-of-the-art educational institutions in Pennsylvania, promoting criminal justice reform, and providing for the relief of the poor. For example, the Friends' Alms House in Philadelphia (1729) became a model of charity for the disadvantaged; when joined with the Bettering House (1767), it offered the Atlantic world a new vision of philanthropy and benevolence.

Perhaps Quakers are best known for their leadership in another area of social reform, antislavery. Prominent Quaker ministers John Woolman and Anthony Benezet were the best-known antislavery reformers in the colonial world. The efforts of Quaker antislavery activists won the Philadelphia Yearly Meeting the distinction of being the first organized religious body to denounce slavery (1754), and Benezet organized the first antislavery society in America (1775).

All told, Quakers made up less than 2 percent of all religious adherents at the time of the American Revolution, and therefore they influenced the direction of American politics, society, and culture out of proportion to their numerical strength in early American history. The cumulative legacy of Quaker efforts to eliminate oppression and liberate the human spirit in the seventeenth and eighteenth centuries gave the denomination a distinct identity.

An epilogue to this colonial experience might be found in the women's movement prior to the U.S. Civil War. After being banned from the World's Anti-Slavery Convention in London because of her gender, Quaker reformer Lucretia Mott helped Elizabeth Cady Stanton organize the first women's rights convention at Seneca Falls, New York, in 1848.

Quebec Act (1774)

Passed by Parliament on June 22, 1774, the Quebec Act attempted to secure the political allegiance of Britain's new Catholic Canadian subjects—acquired as a result of the Seven Years' War with France—by offering them broad civil and religious rights. Responding to the petitions of French Canadians (who were angered by their harsh treatment under appointed British Protestant magistrates) and the urgings of Guy Carleton, governor of Canada, Parliament adopted the bill's liberal provisions.

The Quebec Act extended the boundaries of Quebec north to Hudson Bay territory, east to the Labrador coast, south to the Ohio River, and west to the Mississippi. It combined French Canada's customary legal code relative to property and civil rights with English criminal law, and it granted Canadian Catholics—the traditional spiritual and military foes of Protestant New Englanders—religious toleration and political emancipation. Catholics were allowed to practice their religion freely in exchange for their allegiance to Great Britain. The act did not, however, provide Canadians with an elective assembly. American colonists viewed this omission as proof that Parliament intended to establish tyranny in all its North American colonies.

While to modern eyes the act appears enlightened in its toleration of religious outsiders, in colonial estimations it “proved” that the king was in league with diabolical forces. Colonists viewed the act—together with the Episcopate controversy (1767–1770) and the Coercive, or Intolerable, Acts (1774)—as proof that Britain intended to establish in America the Catholic faith, institute political absolutism, and thereby destroy American Protestants' traditional political rights and religious liberties.

Reactions to the Quebec Act were fast and furious. In 1774, the first Continental Congress responded with a list of grievances supporting a boycott of British trade. Some Southern colonists were angered by the limits the act placed on land acquisitions west of their borders. Settlers eager to move into these Ohio territories did not want to reside in a Catholic colony. Many others inveighed against the act for purely religious reasons. Up and down the Atlantic coast, ministers preached inflammatory sermons against it.

Typical was the reaction of Ezra Stiles, a Congregationalist minister in Rhode Island, who railed against it

for establishing the Romish Idolatry over two Thirds of the Territories of the British ... and thereby exciting a Jubilee in Hell and throughout [the] Pontificate, and this with the direct view & Design of employing the Arms of Papists as such against protestant Puritans.... This obliging Token of Friendship from the Bench of Bishops will not be very soon forgotten by the Puritans of America.

The act had the power of uniting disparate Protestant colonists behind an ostensibly moral issue. Contemporary observers remarked that this bill, more than any other act of Parliament, inflamed the passions of colonials against the Crown and propelled them closer to revolution.

The colonial uproar that followed passage of the Quebec Act confounded Britons, who instead celebrated the liberal religious provisions it granted. But to American colonists, the act violated the historic rights of Protestant subjects. Colonists who had fought in the French and Indian War (the Seven Years' War in Europe) had been motivated largely by a British patriotism that defined itself as both anti-French and anti-Catholic.

Most Anglo colonists interpreted the annals of British history through a Protestant lens, reading their national past as a struggle of Protestant forces

against papal foes over the survival of British constitutional liberties. Indeed, in protests associated with the Stamp Act, colonists burned effigies of the pope alongside those of stamp collectors. Anti-Catholicism also lurked deep in popular political culture. In annual Pope's Day celebrations (Guy Fawkes Day in England), revelers rejoiced that a seventeenth-century Catholic plot to blow up Parliament had been exposed.

Furthermore, Americans viewed the Quebec Act as a direct attack on their own civil liberties. While many did not actually fear that Catholicism would become firmly established in the American colonies, the act appeared to set an alarming precedent. By establishing Catholicism in *one* of its colonies, colonists feared that Parliament was asserting a right to establish a religion in *any* of its colonies, removing the right of individual colonies to regulate themselves.

The act also renewed fears that the Church of England aimed to place Anglican bishops in its American colonies, thus establishing Anglicanism and directly attacking the colonists' religious liberties. To the colonial mind, it was a slippery slope from the removal of religious liberties to the termination of all liberties and, hence, to political slavery. The Quebec Act did, however, help ensure Canadian loyalty to Britain during the American Revolution.

Quebec City

One of the oldest European settlements in the New World, Quebec City was named after an Algonquian word meaning "place where the river narrows." Its powerful influence and strategic location on the north shore of the St. Lawrence River invited several sieges over the colonial period, as Quebec City evolved from a trading post into the heart of New France and finally into a British colony.

In 1535, when French explorer Jacques Cartier visited the area where Quebec City later took root, about 500 St. Lawrence Iroquois inhabited the nearby village of Stadacona. Cartier claimed the region for France. He left the St. Lawrence area the following year, after many of his crew had perished from cold, starvation, and scurvy. Two unsuccessful attempts to settle the area followed shortly thereafter, one by Cartier in 1541 and the other by Sieur de Roberval in 1542–1543.

When Samuel de Champlain arrived in the region in 1608, Stadacona had disappeared, possibly due to disease and intertribal warfare. Champlain established a fur trade with the Algonquin and Montagnais nations and built a dwelling to serve as a fort, a residence, and a storage depot for trade goods. This was erected at the foot of Cap-aux-Diamants, a promontory overlooking the St. Lawrence River and the future site of the walled upper town of Quebec. In 1615, missionaries of the Recollect Order joined the small settlement to spread Christianity to the area's native populations.

In 1627, the French Crown appointed the Company of New France (Company of One Hundred Associates) to oversee expansion of the settlement from trading post to town. This expansion was interrupted between 1629 and 1632, when English privateers led by the Kirke brothers captured and governed the town until the Treaty of Saint-Germain-en-Laye returned it to France. Between 1627 and 1663, the population increased from 72 to 550. The Jesuits established their headquarters in the town in 1633 and founded a college there in 1635. The church of Notre-Dame-de-la-Paix was built atop Cap-aux-Diamants, as was Château Saint-Louis, the governor's residence and administrative center for the colony. The Ursuline Convent was founded in 1639 to educate French and native girls. The town's first hospital, the Hôtel-Dieu de Quebec, was built in 1644.

Called "the jewel of New France," Quebec was founded by Samuel de Champlain on the St. Lawrence River in 1608, making it the oldest city in Canada. It later became the political, religious, and commercial center of the colony. (Brown Brothers, Sterling, Pennsylvania)

In 1663, the French Crown assumed direct control of New France and sent a military governor to Quebec City. Additional administrators, troops, and agents for merchants in France bolstered the city's population. The city also became the religious center of the colony, as Bishop François Xavier de Laval-Montmorency founded the Séminaire de Québec in 1663. A decade later, Quebec City became the diocese for all of French North America. The city's lower and upper towns became increasingly differentiated, as the former spread along the river and remained the residential and commercial district while the latter was fortified and contained administrative and religious institutions. In the eighteenth century, the city's fortifications were strengthened and its port facilities expanded to accommodate an increase in domestic and foreign trade.

Sir William Phips's unsuccessful attack on the city in 1690 prompted Governor Frontenac to begin construction of the Royal Battery. The city survived another siege in 1711, when Sir Hovenden Walker's squadron of ships and some 8,000 troops suffered heavy losses on the reefs of the St. Lawrence River estuary. Britain's last siege of Quebec City came in 1759. A two-month naval bombardment destroyed most of the city's major buildings and wrought considerable suffering upon its civilian population. This was followed by General Wolfe's victory over the Marquis de Montcalm's force in a pitched battle on the Plains of Abraham, which lay behind the walled city. Both generals died in the battle and the French retreated to the city, which conditionally surrendered to the British five days later. With the help of naval reinforcements, the British retained control of Quebec City in 1760 in the face of a French siege. Although the French and Indian War (known as the Seven Years' War in Europe) officially ended with the Treaty of Paris in 1763, the fall of Quebec City signaled the end of the French regime in North America.

In 1763, the population of Quebec City was about 8,000. Under British rule, it remained the administrative center of the region, and its commerce was greatly increased through its exports of wheat and timber throughout the British Empire. In 1775, a colonial American force under Richard Montgomery and Benedict Arnold failed to take the city, which held out under Governor Guy Carleton until British reinforcements arrived.

Britain passed the Constitutional Act in 1791, which divided the Province of Quebec into Upper and Lower Canada. Quebec City, with a population of close to 10,000, became the capital of Lower Canada. The city continued to perform a central role in the British colony and to function as the heart of French settlement in North America.

Queen Anne's War

From 1702 to 1713, Great Britain waged war alongside the Dutch and several German states against France and Spain. This general war in Europe, also known as the War of the Spanish Succession, had far-reaching consequences for colonial British America. Many territories formerly owned by France and Spain reverted to British control, and Great Britain emerged as the dominant commercial power in the Atlantic world. With the concluding Peace of Utrecht, a new international order was fashioned that would carry the important Atlantic powers through the remainder of the eighteenth century.

In many ways, Queen Anne's War was a continuation of King William's War. In the earlier conflict, William III joined with his fellow countrymen, the Dutch, to preserve his title to the throne of England, Scotland, and Ireland against French efforts to derail the Protestant succession and elevate a pro-French Catholic to power. Having won this conflict, William III solidified his alliance with the Dutch and turned his attention to the matter of the Spanish-held Netherlands. The point at issue in 1701 was whether Louis XIV of France, along with other members of his ruling family, the Bourbons, would be able to control the possessions of Spain in the Netherlands, Italy, and the New World. Therefore William III, along with his Dutch counterparts, persuaded several key German states to join in an offensive campaign to wrest control of the Spanish kingship from the Bourbon family, and to wrest control of the Spanish Netherlands, Milan, Naples, Sicily, and the Spanish colonies from French and Spanish forces.

William III died unexpectedly in 1702, so leadership of the conflict passed to his successor, Queen Anne, and her commanding general, the Earl of Marlborough. In the war's early phases, the allies pushed into the Spanish Netherlands and took control of strategic points along the Meuse River in France. Meanwhile, German forces captured several key objectives on the Rhine River, which separated the two powers. Thus the allies were positioned to invade deep into France by means of the major rivers in Northern Europe. Fortunes turned against the allies when France persuaded Bavaria to join its cause in 1703, and together they defeated alliance forces in the upper Rhine, subsequently moving to pressure Vienna. The German states in the alliance were therefore led to request support for a campaign to relieve Vienna, which was reluctantly agreed to by Marlborough. This ultimately brought the British their greatest victory in the European campaign, when Marlborough defeated French and Bavarian forces at Blenheim, along the Danube River in Bavaria.

With this victory, Britain was emboldened to pursue broader goals in the war. Earlier, Britain desired segmentation of the Spanish possessions in Europe and the New World, a rather limited aim. After Blenheim, Britain, along with new allies Portugal and Savoy, wanted to see the Crown of Spain fall into the hands of the royal family of Austria, the Hapsburgs. This led Britain to engage in a new strategy of moving onto Spain itself by means of the Atlantic seaboard and Mediterranean basin. In 1704, the English navy took possession of Gibraltar, at the mouth of the Mediterranean Sea off the coast of Spain. By 1708, the British were in control of Minorca, off the southern coast of France. Victories at Barcelona (1705) and Madrid (1706) enabled the alliance to put a Hapsburg in possession of eastern Spain, though not in control of it all, while allied successes in the Spanish Netherlands, especially at Ramillies (1706) and Oudenarde (1708), weakened the French position in the north.

Peace negotiations, which started in 1709, foundered in the face of determined allied efforts to force unacceptable terms on Louis XIV. That same year, Marlborough had won an appallingly gruesome victory at Malplaquet, but, by that time, most parties had grown tired of the conflict. The alliance disintegrated over the terms to be dictated to France, especially trading rights in Spanish America, and England ultimately made a separate peace with France in 1712.

The Dutch saw that further aggression would be fruitless without English assistance and agreed to the terms of the 1713 Peace of Utrecht. This agreement formally ended the war by recognizing Philip V's control of Spain and Spanish America, though with the proviso that the Crowns of Spain and France should forever be separated. The Netherlands reverted to Hapsburg control, along with Sardinia, Naples, and Milan. Great Britain won title to Nova Scotia, Newfoundland, Hudson Bay, and several French possessions in the West Indies, along with Gibraltar and Minorca.

In the colonies, Queen Anne's War took the form of French privateering up the Atlantic coast and native raids along the frontier. In several colonies, the war became a stimulus to the formation of militias, which were to become important later in the colonial period. In Pennsylvania, the pacifist Quaker governing party was forced to withstand vociferous criticism of its management of colonial defense.

In the end, the war brought to the British exclusive trading rights with Spanish possessions in the New World. These trading privileges, along with its territorial acquisitions, were instrumental to Britain's rise as a major commercial and military power in the eighteenth century. Thus endowed, Great Britain was positioned for global dominance in the nineteenth century.

Quincy, Josiah, Jr. (1744–1775)

Josiah Quincy, Jr., lawyer and patriot leader, was born in 1744 in Boston and raised in nearby Braintree. He graduated from Harvard in 1763, returning in 1766 to collect a master's degree and to deliver one of the first English orations, on the subject of patriotism. Speaking in the aftermath of the Stamp Act, Quincy's speech drew on the writings of the great English Whigs John Trenchard and Thomas Gordon; it suggested the origins of a political philosophy that would guide him for the next decade.

Quincy soon took up the law and trained in the Boston office of Oxenbridge Thatcher. Before long, Quincy was handling the bulk of the firm's business and, when Thatcher died, the young lawyer assumed the remainder. Although he had never been formally "admitted to the Gown," by 1766 Quincy was practicing before the Inferior Court; by 1767, he had built one of the largest practices in Boston.

His financial independence assured, in October 1769, Quincy married Abigail Phillips, the daughter of a leading local merchant, who became the "Dear Partner" of his life. Together, they had two children. Their son Josiah Quincy would become a congressman, president of Harvard College, and a popular mayor of Boston.

Quincy had long believed that Thomas Hutchinson had been responsible for blocking the formal ratification of his legal credentials, so when, during the 1760s, antagonism toward the colonial administrator began to escalate, Quincy led the charge to unseat him. Under various pen names, Quincy caricatured his nemesis as a "rapacious Grasper of Sovereignty, elated with a Plentitude of Power" and soon extended his criticisms to Hutchinson's associates, "these venal hirelings," and the imperial policies they were perceived to be supporting. Through a series of newspaper articles published in the *Boston Gazette*, he advised the local government of the bloody consequences of continued imperial abuse of the colonists: "In defense of our civil and religious rights," Quincy warned in 1767, "we dare oppose the world." Such fighting talk quickly established Quincy as the voice of radical Boston Whigs.

Following the Boston Massacre, Quincy made a bold decision to defend the soldiers accused of unsanctioned murder. Together, John Adams and Quincy argued a brilliant defense that resulted in the acquittal of these hated symbols of British cruelty. While Quincy's actions seemed counterintuitive to many commentators, in fact, they demonstrated to London the maturity of the colonial system of justice and thus the considered seriousness of American objections to the pattern of British administration.

Throughout 1770 and 1771, Quincy continued his newspaper attacks on British North American policy and began encouraging patriot measures, such as the nonimportation agreement. In 1772, he was appointed to the Committee of Correspondence, an important patriot group whose members included James Otis, Jr., and Samuel Adams. It had been established to coordinate patriot action with other groups in other colonies. In this office, he left Boston in early 1773 on a mission to build contacts in the Southern colonies. The journey was also supposed to ameliorate the symptoms of tuberculosis Quincy had recently developed. While the expedition did little to improve his deteriorating health, Quincy returned to Boston in May, having successfully cultivated valuable alliances with political and commercial leaders from Pennsylvania to South Carolina.

Dubbed the “Boston Cicero” by John Adams, Josiah Quincy was a prominent attorney and outspoken patriot. He both won acquittal for the British soldiers involved in the Boston Massacre and helped incite the Boston Tea Party. (Brown Brothers, Sterling, Pennsylvania)

Not yet 30 years of age, the young attorney, despite his slight frame and persistent frailties, now found himself at the center of the conflict with the colonial administration. Using his oratorical gifts (John Adams famously dubbed him the Boston Cicero), he incited local men to board ships in the harbor and turn the tea into the sea.

Throughout 1774, Quincy continued his campaign against Hutchinson. He argued that the governor bore sole responsibility for the ongoing crisis, having “done more general mischiefs and committed greater public crimes than his life can repair or his death satisfy.”

When the British responded to the Tea Party by closing the port of Boston, Quincy published a stinging indictment of the legality of this punishment. He argued that the Boston Port Bill had been used to condemn the town without a formal hearing and disproportionately punished in a manner that precluded redress.

In September 1774, Quincy traveled to England to gain intelligence for the Continental Congress of Parliament's intentions toward North America. He met with Lords North, Dartmouth, and Shelburne, but he was unable to broker any substantive reconciliation.

In the spring of 1775, Quincy sailed for Boston. Already in the last stages of consumption, he died as his ship tied up in Gloucester harbor, only a mile from shore.

Race and Ethnicity

At the beginning of the twenty-first century, Americans tend to differentiate between race and ethnicity, seeing the former as inherited physical differences and the latter as a distinctive sense of common ancestry and culture. But between 1500 and 1700, as Europeans, Africans, and Native Americans met, traded, fought, and talked about each other, concepts of race and ethnicity (and nation) blended together in an ambiguous, often inconsistent, fashion, similar to modern notions of ethnicity. Appearance, clothing, religion, politics, manners, and even food preference and preparation—all were investigated as aspects of a distinct lineage, group, or nation. Sometimes these aspects were viewed as permanent and inherited, and sometimes they were viewed as shaped (and potentially reshaped) by environment.

After 1700, more rigid perceptions of race and ethnicity emerged with a clear hierarchy, as skin color increasingly demarcated legal status, social rank, occupation, and other differences in lifestyle and social relations. On the “colored” side of this dividing line, Native Americans and Negroes were viewed as inferior to whites, with their skin colors (red and black) and “racial” characteristics subsuming ethnic variations. On the white side of the line, colonists perceived substantial variations among different ethnic groups—English, Germans, Scots-Irish, French Huguenots—even though their Christian religion and European heritage provided a fundamental connection.

The history of group identity in colonial North America has three distinctive themes, all of which became more prominent in the eighteenth century. First, there was an emphasis on skin color as the key indicator of group distinctiveness, denoting a cluster of physical, behavioral, psychological, and cultural attributes; this applied not only to Africans and Native Americans but also to Europeans. Second, resulting perhaps from the need to justify the legal and social distinctions of black slavery and the dispossession of Native Americans, Europeans, particularly colonists, increasingly perceived a rigid hierarchy of races, with whites at the top, Native Americans in the middle, and blacks at the bottom. And third, the British colonies in North America, especially New York and Pennsylvania (and, after 1720, the western border areas along the Appalachian Mountains), became more diverse as they attracted a growing mélange of peoples from many areas of Europe, as well as more Africans being brought into slavery.

These three developments encouraged distinctions of race in colonial British America that supplanted traditional English demarcations of class and even gender. Ironically, these distinctions became even more rigid and comprehensive after 1750 among some of the Anglo-American intellectuals who embraced the new Enlightenment notions of objectivity and scientific truth.

First Impressions

In the fifteenth century, as Europeans began to explore and trade on other continents, they brought with them various preconceptions that would shape how they perceived the many peoples they would meet. The biblical book of Genesis taught them that all humans came from a single ancestor, created by the same God. All of those descendants (and other creatures on earth) were assigned a permanent place in life in the Great Chain of Being, which connected all existence, from the lowest insects to the heavenly hosts—a concept with roots in ancient Greece but which served Europe's relatively rigid social hierarchy. Those descendants were divided into two clearly delineated groups, Christians and unbelievers. All Christians were to be brethren, responsible to each other and the Church; slavery was barred among Christians, although not servitude.

While Europeans were attentive to how different peoples looked, dressed, and acted, their intellectual framework was founded on Aristotelian philosophy and physics, which reinforced biblical concepts that the environment shaped human variation. English writers, like other Europeans, focused on the body as a reflection of the universe, with the body's four humors (black bile, blood, yellow bile, and phlegm) corresponding to the universe's elements (earth, air, fire, and water). The balance between those humors shaped a person's (and a people's) nature. That balance was influenced by the local climate, as well as by inheritance and various aspects of culture such as food.

European notions of exotic peoples and cultures evolved rapidly in the sixteenth century. The expansion of direct trade with Africa and the discovery of the Americas, which came as the printing press and literacy became more widespread, spawned a growing literature of travel stories and other writings, which focused on those strange places and peoples. These accounts focused on religion, clothing, physiognomy (including skin color), and temperament, and often speculated about how those characteristics were shaped by the group's climate and environment.

Europeans generally agreed that Africans' skins had been burned black by the equatorial sun, and, given their biblical ideas about creation and monogenesis, they rejected the idea that Africans were not fully human or somehow created differently. But intellectuals used to arguing over whether the English or French climate was more conducive to high civilization were easily able to agree that the equatorial heat of Africa fostered durable, insensitive bodies, inherently fitted for heavy labor and low social status.

Early European commentators often described Native Americans either as simple, noble, and Edenic—as in this depiction of Florida Indians by the Flemish-German engraver Theodore de Bry—or as cannibalistic savages. (New York Public Library, New York)

Some writers, drawing on older Catholic literature, connected the Africans' skin color with God's curse on Ham or his son Canaan as described in Genesis 9–10. That tradition included the notion that Ham and his male offspring were particularly libidinous, and Europeans tended to view West Africans (who wore relatively few clothes) as innately sensual and driven by lust. Some Europeans even tried to connect African humans to African apes, describing similarities between the beast-like man and the man-like beast, and theorizing that apes had attacked and copulated with African women. While writers continued older traditions of viewing Africans' animist and Moslem religions as a crucial division between savage cultures and Europe's civilized ways, the intellectual foundations for racism and for plantation slavery in the Americas were set during the early stages of exploration and trade with Africa.

Also important was how the Europeans' notion of race shifted noticeably after they began exploiting the Americas. Initially, Native Americans were not described in terms of color, or, if they were, they were considered white like Europeans, although somewhat tanned by paint or dye or "smoked" by the fires in their wigwams. Since many Native Americans lived along the same latitude as darker-skinned Africans, Europeans began to reject the concept that skin color was determined by one's distance from the equator, and by extension began questioning older notions that the environment generally determined human characteristics.

Native Americans became a cultural mirror: Europeans tended to describe them as simple, noble, and Edenic (in order to criticize unwanted developments

in their own countries, such as crowded cities and capitalism) or as hideous cannibalistic savages (in order to excuse their hostility and aggression toward the native peoples). While this bifurcated view persisted past the colonial period, most European intellectuals depicted Native Americans as nearly at the level of animals, because the men were relatively hairless and were seen as exerting little control over their environment, and the women wore few clothes and were supposedly insubordinate, with high sexual appetites.

Again, Christianity was often depicted as the most significant distinction between Europeans and others. At best, Native Americans were seen as having no religion and, at worst, as devil worshipers. While many writers thought that culture and environment alone made Native Americans different—that even their skin color was a result of culture (unlike those in Africa)—descriptions of Native American savagery supported ideas of innate European superiority.

Race and Slavery in the Americas

When sparsely settled or easily conquered subtropical lands were found to the west, Europeans established plantations and saw Africans as ideally suited to forced labor in those environments. In the 1340s, the Portuguese found the Azores, Madeira, and Canary Islands off the west coast of Africa; they established sugar plantations worked first by natives and then by imported African slaves who were worked to death. In the 1500s, the Spanish and Portuguese imported this barbaric but profitable system to the West Indies and Brazil; the Dutch, French, and English would copy the model in areas suitable for growing sugar, tobacco, rice, and other plantation crops.

Such treatment was justified in part by the ideology of the Crusades, which allowed unlimited war against (and exploitation of) non-Christians. European laws generally distinguished between slavery and servitude, with the former permanent and the latter temporary, and limited slavery to war captives or condemned criminals. During the long *Reconquista*, the reconquest of the Iberian Peninsula, however, the Spanish and Portuguese became used to taking Muslim captives (some from North Africa) as slaves. By the thirteenth century, Iberian legal codes allowed for Muslim slaves and distinguished between a range of ethnic and religious categories based on ancestry and religion. Europeans also had been hardened to abuse and death by the system of feudalism and by wave after wave of epidemics, particularly the bubonic plague of the mid-fourteenth century. Most important to the development of slavery was the gradual evolution of the concept of race, which transformed Africans into a different type of human, somewhere on the Great Chain of Being between Europeans and animals.

The Spanish and Portuguese initially tried to make Native Americans labor in their mines and plantations but quickly discovered problems with that system. Native Americans resisted compulsory labor (often killing themselves), and they were extremely susceptible to epidemics. Their enslavement was hotly debated and finally outlawed by Spain (in the 1520s) and Portugal (in the 1570s), although those laws were frequently violated. The colonists therefore had a strong motivation and the legal tradition to import large numbers of Africans as slaves on sugar plantations in the Indies and Brazil. By 1550, the slave trade was firmly established in Latin America.

Spanish and Portuguese colonial laws distinguished between whites, Native Americans, and slaves; thus slavery and racism were joined from the beginning and became a mutually reinforcing system. But the Iberian tradition of slavery and relative willingness to intermarry with others, based on the notion that European "blood" was strongest and would therefore gradually "whiten" others, created a more complex racial structure in Latin American society and culture. Many African slaves and their (often mixed) descendants gained freedom in various ways; in addition, a growing number of Native Americans and their mixed descendants moved to the towns, away from their indigenous communities. The result in Latin America was a hierarchical continuum of racial categories based on the degree of European, Native American, or African ancestry, each defined and regulated by an increasingly complex social code but not necessarily (as in British North America) distinguished and restricted by legal codes.

England began its efforts to understand and exploit the Americas with a deep sense of rivalry with Catholic Europe, and English writers frequently criticized how the Spanish and Portuguese abused Native Americans. Promoters of colonization such as the Hakluyts frequently trumpeted that English traditions of liberty and Protestant values would result in fair and just treatment of Native Americans. The reality, however, proved very different.

English leaders and colonists were fearful and contemptuous of the indigenous peoples and preferred to keep their communities separate while attempting to subject the natives to the colony's sovereignty and rule. When the English began establishing colonies in the West Indies, they copied the Spanish and obtained African slaves from Dutch merchants to work their sugar plantations.

The English also adopted the harsh Spanish and Portuguese laws regulating slaves, as well as the terms "Negro" and "mulatto" for Africans and their mixed descendants. In the long run, the Spanish tended to be much more precise about how they categorized race, but they also were more open to intermarriage between Europeans and native peoples, and they made racial variations an important shaper of class. For the English, notions of race, as they developed, proved more important than class or even the condition of servitude.

In the English colonies, racism developed as part of the institution of slavery. The first Africans to arrive were sold by Dutch merchants to Virginians in 1619, only twelve years after the colony was founded and just as those colonists were embracing tobacco—a very profitable crop if one had rich soil and sufficient laborers. But most of the unfree laborers obtained by planters in the Chesapeake region over the following half century were young Englishmen indentured for four to seven years of servitude. More Africans also were acquired, primarily from the West Indies; while the records are sparse and incomplete, initially some were apparently treated as bound servants and even gained their freedom, even though they were held longer than whites, while others were held as slaves without redemption.

The Middle Passage—marked by overcrowding, a lack of proper nourishment and sanitation, and outbreaks of disease—was only the beginning of a long nightmare for African slaves and their descendants in the New World. (Wilberforce House, Hull City Museums and Art Galleries, United Kingdom/Bridgeman Art Library)

Whether free or slave, Africans and their descendants were set apart by the label “Negro,” and that difference widened over time. After 1640, some were put into slavery for life by courts, which never happened to whites. Probate records and other documents show that Africans and their descendants were worth more than whites, which pointed to longer or unlimited servitude; the higher prices of black women pointed to inherited servitude for their children, a practice that did not apply to the children of English indentured servants.

The emergence of new concepts of race appeared in the changing terminology used by English colonists. They increasingly tended to refer to themselves as “English,” “free,” and “white” rather than “Christians,” and described Africans and their descendants as “Negroes” and “blacks” rather than “heathens” or “pagans.”

Fashioning Racial Barriers

Anglo-American concepts of racial differences were not initially set in law, but that began to change by the end of the seventeenth century. Not surprisingly, the plantation colonies of Virginia and Maryland were the first to create laws that discriminated against Africans whether slave or free. In 1640, Virginia barred blacks from carrying arms in militia service. Other English colonies showed the same tendencies: Massachusetts passed a similar statute in 1656, and Connecticut followed four years later.

After 1660, the plantation colonies began to create laws that explicitly connected slavery and subordination to Africans and their descendants. The first comprehensive set of racial laws was created by Barbados in 1661; this primarily regulated slaves, but its criminal provisions were also explicitly directed at free blacks. This code was reflected in many of the Virginia and Maryland laws passed after 1660, and it was adopted wholesale by the infant colony of Carolina in 1692. Southern colonies increasingly treated descendants of Africans as property rather than people—for example, taxing slaves as chattel rather than as servants—and that line also crept into Northern colonies, where slavery was relatively less significant.

These laws continued to equate slavery (and Africans) with heathenism, although they also clearly exempted white heathens from slavery and made sure that an African’s conversion to Christianity would not result in freedom. The result was a system that connected slavery with a particular people and connected that people with slavery. Native American slavery, on the other hand, declined in the English colonies as natives were increasingly viewed as innately disorderly and impossible to control in permanent servitude.

The growing emphasis among Anglo-American colonists on skin color and “pure blood” as the source of identity, social status, and legal privileges (or handicaps) can be viewed in the growing body of laws that sought to shore up the expanding institution of slavery by isolating and dominating *all* blacks. Anglo-Americans were particularly concerned about preventing interracial sex, which highlights the emerging sense of race as a fundamental, biological distinction between superiors and inferiors. In 1691, Virginia made marriages between blacks and whites (free or not) punishable by banishment, and a white woman who bore a mulatto child out of wedlock would be fined or sold into service and the child bound for thirty years of servitude. Similar bans on intermarriage were quickly passed by nearly every colony; even Massachusetts enacted such a law in 1706. Such laws were inspired by the desire to avoid weakening the physical boundaries between slaves and free whites, a perception of interracial sex as polluting white purity. There also was a continued belief in the mythology that African men were extremely aggressive sexually—and perhaps more desirable to white women. Colonial laws and practices also lumped “mulattos” together with “Negroes,” thereby reinforcing racial boundaries and spurning the Spanish pattern of creating different terminology and rules for varying percentages of African ancestry.

Colonies also limited the civil rights of free blacks. A 1705 Virginia law denied free blacks the right to hold office or testify as a witness in court, and

deemed it a crime if they struck any white person, even in self-defense. In 1723, the colony barred free blacks from voting. Such laws point to how America slavery and racism absorbed the fear and contempt felt in England by the upper and middling classes for the inarticulate lower class, allowing an ideology of equality to emerge after 1700.

Other colonies with sizable black populations passed similar measures, although the South was far more obsessed with barring free blacks from civil and political privileges. The New England colonies, for example, required blacks, Native Americans, and mulattos, free or slave, to have permission from their employers or owners to travel or visit taverns at night, but they encouraged literacy and allowed slaves to testify against whites.

Regardless of such differences, a growing body of colonial laws created a reinforcing connection between skin color and subordinate status. This further linked black people and slavery, although the continued ambiguity of racial concepts and persistent legal differences between free and slave status continued to provide a niche for free black households even in the Southern slave societies. Race, as indicated by skin color, thus became one of the most significant Anglo-American paradigms, as the colonists separated their world into discrete segments of whites, blacks, and “tawny” Native Americans.

The growing racial boundaries still did not create a sealed system. Many white slave owners used the black women they owned as sexual partners. While such relationships were often on the level of rape, some may have been affectionate—apparently including the probable relationship between Thomas Jefferson and Sally Hemings—and occasionally their offspring were given special status or privileges. Such illicit liaisons were generally condemned and concealed in the upper South but openly conducted in the lower South and in French Louisiana. Lawmakers and ministers complained that whites of the “lower sort” socialized with blacks in taverns and during the occasional “African election festivals.” They also occasionally noted intimate relationships between black men and white (especially Irish) serving girls, indicating that class continued to trump race among some colonists. Some slaves also managed to escape, occasionally with the assistance and companionship of a white servant. Some black freedmen became semi-respected members of their local community, in both the North and the South. Free mariners of color from the Americas, Africa, and Europe traveled within the Atlantic world of seaports and coastal settlements.

All of this posed a symbolic and potentially real threat to the system of race-based slavery and domination. Anglo-Americans increasingly came to fear uprisings in which free blacks would join slaves in a threat not just to slavery but also to the lives and property of all whites. Conspiracies emerged or real uprisings actually took place in New York City in 1712 and 1741, in Charles Town, South Carolina, in 1739, and in Maryland in the late 1730s.

Evolving Racial Identity

Ironically, non-Europeans in the Americas were compelled or influenced by their relationships with the colonists to adopt similar paradigms. Soon after colonization began, native peoples were referring to themselves as “Indians,” even as tribal, village, and clan identities remained preeminent. This was in part because Europeans used this term and in part because Native Americans felt the need for a collective term to distinguish themselves from the newcomers.

After more than a century of seeing how Europeans saw themselves as “white” and more alike than different, Native Americans began to see themselves as *red* American Indians, with the same ancestry and essential characteristics. Southeastern tribes also had traditions of symbolic meanings for colors, including red and white, which made those terms metaphors for a host of cultural meanings that paralleled modern notions of race. At about the same time, a radical and powerful pan-Native American movement developed among Eastern Woodland tribes, whose prophets often described separate creation stories for native peoples, whites, and blacks, and sought to unite all tribes into a single community to resist the colonial invasion.

Africans and their descendants in North America were similarly compelled by the circumstances of slavery to subsume tribal, religious, and national divisions, although some distinctions persisted. Initially, most bound Africans were brought from the West Indies or South America, and some were born in European colonies. As British American slave societies developed after 1680, the balance of new slaves shifted to those brought from West and Central Africa. Between 1690 and 1740, the sudden and heavy importation of Africans into the Chesapeake created social conflicts between native-born slaves and new arrivals, particularly since Creole women often refused to marry African men.

After 1740, the importation of slaves rapidly declined, plantation sizes increased, and communities developed as slave demographics became more balanced. Slaves and their descendants forged a new and unique African American identity, encompassing shared or particularly appropriate aspects of tribal cultures, even as distinct experiences of enslavement and subordination created two distinct black communities (and cultures) in the Chesapeake and coastal Carolina.

Anglo-American preferences for lighter skin also may have been partially accepted by African descendants. Scattered evidence indicates that some mulattos considered themselves superior to those with darker skins, a propensity that became clearer in the nineteenth century.

Diversity in the Mid-Eighteenth Century

After 1700, colonial British America became increasingly diverse: as growing numbers of Africans were imported into the coastal South, large numbers of Germans and Scots-Irish immigrated to New York and Pennsylvania. By the middle of the century, Africans were about a third of the population in the South (and a majority in some coastal counties), and more Irish and Germans than English were coming to the mainland colonies. Most of the Irish were Scottish Presbyterians, but about a quarter were Catholic. The Germans were primarily members of pietistic Protestant movements such as the Moravians, who tended to form insular settlements and sought to maintain their distinctive language and culture.

Some Anglo-Americans reacted to the growing diversity in racial terms. For example, Benjamin Franklin, who noted in *Observations Concerning the Increase of Mankind* (1751) that “the Number of purely white People in the World is proportionably very small,” called the German immigrants (and most Europeans) an alien “swarthy” race, and advocated keeping out “Blacks and Tawneys” in order to ensure that “the lovely White and Red” remained “the Complexion of my country.”

European and African Ethnic Groups, North America, 1775. While administered by the British government, on the eve of the American Revolution, the thirteen colonies were made up of a complex mix of European and African ethnic groups. (Carto-Graphics)

Franklin's outburst not only showed the ambiguous nature of Anglo-American racial concepts and how some white men continued to see an essential brotherhood between themselves and Native Americans, but it also pointed to how even the few colonists who, like Franklin, objected to the practice of slavery still accepted racist beliefs. In fact, the first American antislavery tract, Samuel Sewall's *Selling of Joseph* (1700), while positing the essential unity of mankind beginning with a single creation, called for an end to importing African slaves because "there is such a disparity in their Conditions, Color & Hair, that they can never embody with us ... but still remain in our Body Politic as a kind of extravasat[e] the Blood"—that is, outside the community.

By the middle of the eighteenth century, Anglo-American concepts of race were a confusing mélange of concepts, prejudices, fears, norms, and laws—all of which coalesced into two seemingly contradictory yet reinforcing tendencies. The first was a bichrome, hierarchical demarcation of "white" versus "colored," which was driven by the race-based slave system, generations of laws that painted blacks as inferior, and insecurities about black revolts. In this sense, differences among Europeans were perceived as ethnic rather than racial; the former could be readily altered or reshaped over time, while the latter was innate and unchangeable and marked the boundary between superior and inferior peoples.

One element shaping this shift in perception was the increasing intermarriage between Native American survivors and blacks within areas of English domination. Anglo-Americans came to view the remaining coastal Native Americans as part of an undifferentiated "people of color," and legislatures began to link Native Americans and blacks in restrictive racial laws. This bichrome view of race expressed the most fundamental characteristic of power and domination in colonial British America by the mid-eighteenth century. It would be embedded in the first federal census of 1790, with categories of "slave," "white," and "all other free persons."

The second tendency was to emphasize human complexity and diversity, which was expressed primarily by the Enlightenment effort to catalogue and order the natural world by detailing innate and unvarying differences between species, including humans. This was driven in part by the continuing discovery of new and strange animals in the Americas, Africa, and Asia; it also was based on a growing understanding of reproduction, which emphasized the continuity of physical traits.

In 1684, François Bernier differentiated mankind into four to six groups and, not surprisingly, picked skin color as the best characteristic to distinguish each race. A half century later, Charles Linnaeus in *Systema Naturae* tried to catalogue all living things, including humans, and nearly every subsequent scientific study began with that paradigm. This new system was vague and malleable, and, while it was not innately judgmental, it could be used to prove

or disprove a hierarchy of races.

Many Anglo-American intellectuals, including Benjamin Rush, proclaimed that whites and blacks were equal, and that all differences were environmental—much as John Locke described the human mind, regardless of race, as a tabula rasa, or blank slate. Others, particularly Southerners deeply rooted in their slave societies, utilized Enlightenment ideas to solidify older, amorphous notions of race. Thomas Jefferson's *Notes on the State of Virginia*, which he wrote between 1782 and 1783, used his observations of slave behavior to detail how they lacked "reflective" and "imaginative" abilities; he strongly suggested ("a suspicion only") that blacks "are inferior to the whites in the endowments both of body and mind." Ironically, he also countered French scientist Georges Buffon's contention that the North American environment "degenerated" animals (including humans), vigorously defending the essential equality between Europeans and Native Americans and pointing to cultural factors as the sole causes of Native American barbarity.

By the outbreak of the Revolutionary War, scientific ideas of innate racial differences had joined with less reasoned prejudices to form the dominant concept of race. Despite an upsurge of Enlightenment egalitarianism among some American intellectuals in the wake of the Revolution, most considered race to be considered innate and hierarchical: it was connected to skin color, denoted an individual's intellectual and moral condition, and served as the key indicator of one's social and legal status. Any recognizable amount of African ancestry would condemn an individual to the lowest rank.

By the early nineteenth century, European and American intellectuals had rejected Enlightenment notions of environmentalism and, extending Jefferson's ideas, constructed an increasingly elaborate system that ranked human races in terms of innate intelligence and morals, with Africans (or one particular group of Africans, which Europeans called the Hottentots) at the bottom. This marked the genesis of modern racism, because the notion of black inferiority was justified by supposedly dispassionate, provable scientific data, and also because such distinctions were unchangeable, and any modifications violated natural law.

In this form, racism became deeply rooted in American culture and institutions, Northern as well as Southern, well before the Civil War. After the war, it continued to shape American thought and culture well into the twentieth century, essentially creating two worlds, white and black, within the United States. While the intellectual and legal tide has since turned, and race is increasingly depicted as a social and cultural construct akin to ethnicity, contests for economic and political power continue to divide whites and blacks in America.

Raleigh, Sir Walter (1554–1618)

Sir Walter Raleigh remains one of the most vibrant and fascinating figures in English colonial history. He was born in 1554 at a farmhouse called Hayes Barton, in Devon. His father, Walter Raleigh, was of noble birth but relatively modest means. His mother, Katherine, belonged to one of the more prosperous families in the West Country.

Not much is known of Raleigh's early life, though like other boys of his social standing, he likely learned from a tutor how to read and write in English and Latin. Raleigh was his father's fifth son, and as such he could expect very little as far as his inheritance was concerned. His father did manage to send him to Oxford, where he probably studied for a year before heading off to the religious wars in France from 1569 to 1574.

Upon his return from France, Raleigh took up study at the Inns of Court, though he apparently had little interest in becoming a lawyer. He and his older half-brother, Sir Humphrey Gilbert, had more exciting plans. They proposed in 1577 to take to sea in an effort to capture Spanish ships, sell them to the Dutch, and use the proceeds to attack Spanish colonies in the Americas. Although Queen Elizabeth was not impressed at first by the idea of attacking the Spanish, she eventually granted Gilbert permission to seek out territories not occupied by Christian princes or people for six years. Their mission was allegedly a colonizing venture, but the real mission was privateering, and in this both Raleigh and Gilbert failed.

Raleigh went to Ireland in 1580 as part of large English force sent to crush a rebellion there. Raleigh's behavior in Ireland, though it may seem vicious, was unexceptional in the eyes of the English. Raleigh participated in the wholesale slaughter of 600 men at Fort Smerwick. He also wholeheartedly advocated the destruction of Irish crops, Irish livestock, and Irish people. In addition, he seems to have purposefully put himself in harm's way, apparently so he could extricate himself with a feat of unnecessary bravery. Raleigh, though he hated the Irish as much as anyone, saw little opportunity for money or glory in Ireland, and he chafed under the leadership of Lord Grey, his superior officer there.

As legend has it, when Raleigh met Queen Elizabeth for the first time, he spread a new cloak on the ground to prevent her from stepping in a puddle. This story is probably not true, but it points to the larger fact that Raleigh made an immediate positive impression on the queen. Raleigh's image at court was that of a flashy outsider, and Elizabeth was apparently impressed with his intellect and wit.

In 1583, Raleigh interceded with the Queen on behalf of his half-brother Gilbert who, still working on the old patent of exploration, intended to found a colony in North America. Raleigh also supplied a new ship and bought stock in Gilbert's company. The expedition did claim Newfoundland for England, but it also claimed Gilbert's life, for he drowned on the return trip.

During this period, Raleigh continued to accumulate gifts from the queen. He received several substantial manors and a large financial gift in the form of the "Farm of Wines," a monopoly under which every wine maker in England had to pay Raleigh a fee. Elizabeth also gave Raleigh a license to export cloth, another highly profitable plum. Raleigh began to acquire clothes, jewels, and a serious desire to colonize North America. In 1584, Queen Elizabeth granted Raleigh permission to explore and claim territories, reserving 20 percent of any gold and ore he might find for the British Crown.

Under the sponsorship of Queen Elizabeth I, the dashing courtier, military commander, and writer Sir Walter Raleigh organized the first, failed attempt to establish a settlement in North America, the Roanoke Colony, in the 1580s. (National Portrait Gallery of Ireland, Dublin, Ireland/Bridgeman Art Library)

The Lost Colony and Its Aftermath

Until Sir Walter Raleigh came on the scene, England had primarily viewed North America as an obstacle to effective exploration, the goal of which was to discover a speedy route to the Far East. Raleigh changed this by focusing on America itself. Raleigh's motives for colonizing are not precisely clear; he likely hoped to find treasure, raid Spanish colonies, and explore simply for the sake of exploration.

The first voyage to North America undertaken on Raleigh's behalf was a smashing success, particularly in the area of public relations. Two well-equipped ships financed by Raleigh and commanded by members of his household sailed from Plymouth in April 1584. They stopped in Puerto Rico for a new supply of food and water, then sailed north to an island off the coast of present-day North Carolina, where they stayed for six weeks. The expedition returned to London with two Native Americans, who became instant celebrities. Raleigh was elected to Parliament in the same year. Raleigh, together with Arthur Barlowe (one of the captains of the voyage) and both Richard Hakluyts, Senior and Junior, tried to muster support for an even more extensive colonizing expedition.

The second expedition was to include 500 men; reinforcements were to follow. Thomas Harriot and John White were tapped to study the region's native peoples, mainly Algonquian speakers. In April 1585, at least seven ships containing about 600 men sailed for Virginia. After some trade, piracy, rough weather, and adventures at sea, the colony at Roanoke was established in the summer of 1585. Supplies were short, though, so only 100 men remained and the rest returned to England.

Throughout the winter of 1585–1586, the colonists struggled to eke out a living in an unfamiliar environment. They explored their surroundings, establishing friendly relations with some tribes and leaning on others for food and supplies. Not surprisingly, relations with Wingina, the nearest tribal leader, went sour. In June 1586, the colonists killed Wingina and beheaded him. This hostile situation resulted in the abandonment of this first Roanoke colony.

Raleigh collected the accounts of the first colonists and decided to outfit another expedition, intending that this second party would have less of a military character and would settle near Chesapeake Bay. Under the leadership of John White, the group, which included women and children, sailed in 1587. After a few weeks, responding to the colonists' worries over supplies, White returned to England, promising to return soon with the needed goods; however, he was not able to return until 1590. He discovered the colony abandoned, the fort ransacked, and the word "CROATOAN" carved into one of the posts.

What happened to the colonists at Roanoke stands as one of the great mysteries in early American history. They may have fallen victim to an attack by Native Americans or been adopted into neighboring tribes. Their fate is wrapped in legend and folklore. Some of the Jamestown settlers claimed to have heard Powhatan boasting that he had killed them when his armies invaded the island. In the later seventeenth and early eighteenth centuries, explorers claimed to have seen fair-skinned, blue-eyed Native Americans on the coast of Virginia. The loss of the colony stung Raleigh, who still believed that an English settlement could thrive there.

Raleigh in the Tower and Eldorado

In 1588, Sir Walter Raleigh was at the height of his power and prestige. By 1592, he had been disgraced, dismissed from Elizabeth's court, and imprisoned in the Tower of London. Although he was never formally charged, it seems likely that his crime lay in offending the queen by concealing from

her his marriage to Elizabeth Throckmorton, a maid of honor in Queen Elizabeth's court.

While in the Tower, Raleigh continued to conduct his business, which, in fact, was booming. Ships belonging to Raleigh had captured the Portuguese ship *Madre de Dios*, which was until then the richest single prize ever brought into an English port. Raleigh, from his cell, secured Elizabeth's share of the booty and thereby secured his release from the Tower.

Raleigh, who was still banned from court, believed that an expedition to Guiana could win back the queen's favor. In 1595, therefore, he set out in search of Eldorado, a mythical kingdom of gold thought to exist somewhere in the Americas. Raleigh finally reached the Orinoco River and sailed up it with a small fleet of rowboats, but he never found Eldorado. His adventures did raise his standing in the eyes of some English people, but the queen largely ignored his expedition. Raleigh undertook a number of military missions against the Spanish, including an abortive attack on Cadiz, but never regained the prestige of his early years at court.

Upon Elizabeth's death in 1603, James I took over the English throne and began to replace Elizabeth's court with his own. This did not bode well for Raleigh, who was brought up on charges of treason and, following a sham trial, once again imprisoned in the Tower of London. He remained a prisoner there for thirteen years, until he was released in order to secure financing for another voyage to the jungles of South America, where Raleigh's party clashed with a group of Spanish explorers.

Raleigh was accused of trying to start a war between England and Spain. He was beheaded in London in October 1618. The massive, Anglocentric *History of the World* he had been writing while imprisoned remained unfinished.

Raleigh's relevance to colonial America deserves note. He was one of the leading men of Elizabethan England and spent much of his life and fortune encouraging, financing, and participating in colonization schemes. He financed the Roanoke colony, which, although it failed, paved the way for more successful experiments at Jamestown.

Reading and Literacy

During the medieval and early Reformation periods in Europe, the ability to read or write belonged primarily to clerics and wealthy members of the nobility. In contrast, the seventeenth and eighteenth centuries saw the first moves toward a predominantly literate population on both sides of the Atlantic. The reasons for these changes were both religious and social. As in England and throughout Europe, a wide range of literacy existed in the North American colonies.

Southern Colonies

The first permanent English settlement in North America was the Jamestown colony, founded in 1607. Although the Anglicans who settled Chesapeake, Virginia, and the Catholics who settled Maryland had very different religious ideas, they shared similar cultural standards. The leaders of both colonies came from wealthy families in England, accustomed to controlling everything and everyone around them. Literacy for the masses was feared and carefully controlled. Coastal North and South Carolina functioned in much the same way. In all four colonies, wealthy men had a literacy rate of close to 100 percent. In contrast, only 30 percent of indentured servants could at least sign their names and only 1 percent of African American slaves could do so. Likewise, only 25 percent of women, even wealthy women, were literate.

As a means of controlling literacy, education was carefully managed. Slaves were subject to the strictest laws and could have a finger amputated for

learning to read. While grammar schools were rare, the region founded universities equal to those in England. A planter's son could be taught at home and then sent on to the College of William and Mary in Williamsburg, Virginia. Unlike other parts of North America, even yeoman farmers' children had few options for an education. The best they could hope for was literate parents.

To limit the spread of books, Virginia's governor, Lord Culpeper, ordered that all printers be subject to the "king's pleasure" in the 1670s. The first printer in Maryland, William Nuthead, was ordered in 1693 to print only blank bonds for fear that he might circulate subversive broadsides.

Backcountry Literacy

Literacy in the western backcountry of Virginia, Maryland, North Carolina, and South Carolina was also low. The region was settled predominantly by indentured servants and Scots-Irish emigrants who were well enough off to afford passage to North America but too poor to afford land near the coast. Literacy for the population as a whole stood at about 30 percent at the time of the American Revolution.

Unlike other regions, literacy was not linked to religion. Faith was spread through the spoken rather than the written word. This emphasis is evident even among literate settlers. In the early 1750s, four out of five titles found in personal libraries were secular rather than religious. In contrast to the Scots-Irish communities, Protestant German and French settlers also created small pockets of literacy throughout the backcountry.

The primary reasons for illiteracy in the West, unlike the coastal South, stemmed more from cultural differences than from strict laws. Literacy today and in the other English colonies is defined by the ability to read or write. In contrast, literacy in the backcountry was defined by oral tradition. A man or woman who could remember stories, ballads, and the lore of cooking and herbs without written text was not illiterate by backcountry standards. They were also carrying on the traditions of hundreds of years in Ireland and Scotland.

New England

The southern New England colonies—Massachusetts, Connecticut, and Rhode Island—saw the highest standards of literacy in North America. All three were settled by the Puritans. A product of the Reformation, they sought to improve, or purify, both Anglicanism and English society. Most of the Puritans came from East Anglia, a part of England that was already known for its high literacy rates. A core tenet of their faith was the belief that all church members should be able to read the Bible for themselves. They also made the first English translation of the Bible in the 1550s. Their Bible was outlawed in England in the early seventeenth century by James I, leading to the need to emigrate.

Once the Puritans were settled in New England, laws designed to promote literacy throughout society were quickly passed. In 1647, the Massachusetts Bay Colony passed a law called the "Old Deluder Satan Act," requiring every town of fifty families to have a schoolmaster and every town of 100 families to keep a grammar school. Connecticut passed similar laws in 1650. In contrast, Plymouth Colony, much poorer than its Massachusetts counterpart, saw lower levels of literacy in the early seventeenth century. By the outbreak of the American Revolution, the literacy rate among men in all three colonies was close to 90 percent. Despite these efforts, some women, servants, and poorer members of society were left uneducated. Near total literacy was not achieved until well into the nineteenth century.

While Massachusetts, Connecticut, and Rhode Island had very high standards of literacy, this was not the case for all of New England. For instance, literacy was far less common in Maine, despite the fact that it was a part of Massachusetts for most of the colonial period. Maine was settled by a combination of trappers and traders and people who left the Plymouth Colony. It also remained a frontier settlement well into the eighteenth century. Vermont and New Hampshire saw similar settlement patterns. Northern New England also had a stronger French Catholic influence than southern New England. The strong urge toward literacy was a mark of the reformist Protestant religions rather than Catholicism. Despite this, Maine, New Hampshire, and Vermont still shared more regional similarities with the rest of New England than with other colonies.

Middle Atlantic Colonies

The primary English settlement group in the Middle Atlantic region of New York, Pennsylvania, Delaware, and New Jersey was a religious group known as the Quakers. Although knowledge was important to the Quakers, they also had a strong dislike of hierarchy. Children were usually educated at home rather than in organized schools. Literacy was also less prized by the Quakers than the Puritans. While a Pennsylvania law passed in 1683 required that all children be taught how to read in school, it also required them to learn a useful trade. Education beyond the grammar school level was less common. By 1776, Pennsylvania had founded only one university.

The Middle Atlantic colonies also comprised the most ethnically diverse populations of the North American colonies. New York was initially settled by the Dutch, bringing with them a Protestant interest in literacy. In 1700, some 80 percent of men and 60 percent of women in Holland were literate. This emphasis remained despite Anglican control of New York after 1664. Dutch-language books and newspapers continued to circulate in the colony. A New York bookseller in 1702 stocked a wide selection of secular and religious books in Dutch.

The hornbook, a kind of reading primer for children, was one of a proliferation of teaching tools that contributed to the spread of literacy in the colonies. A sheet of vellum or parchment displaying the alphabet was attached to a paddle-shaped board. (Brown Brothers, Sterling, Pennsylvania)

Farther south, Swedish and Finnish settlers moved into Delaware. By 1675, Sweden had literacy rates similar to those of Holland and New England. Germans brought similar codes with them to Pennsylvania. As most Quaker laws allowed other settlers to create their own schools, the European and Quaker colonists had little influence on one another.

Overall, the Middle Atlantic colonies float somewhere between the Chesapeake and New England. Like the Puritans, literacy was important to most of the people settling there. Unlike the Puritans, they demonstrated a less aggressive interest in spreading it, leading to lower literacy rates. There were also larger gender gaps in literacy in the Middle Atlantic region. At the time of the American Revolution, literacy for men in all four colonies stood at about 65 percent. Literacy for women was closer to 40 percent.

Wealth and Literacy

Those who had wealth and power in the colonies were usually also able to read and write. Literacy was not, however, an absolute necessity for success or survival.

In 1651, William Phips was born in modern-day Woolwich, Maine, to parents who may or may not have been able to read. Throughout his life, Phips was dependent on others around him (most likely his wife, Mary Spencer Phips) for assistance in reading and writing. In 1691, Phips became governor of the Massachusetts Bay Colony and was also knighted. While Phips is an exception rather than the rule, the fact that he received this honor indicates a great deal about the colonial period. That is, universal literacy was still a foreign concept.

Measuring Literacy

Identifying and defining literacy in the colonial period often requires different measures and standards than those customarily used today. A common indication of literacy is the ability to sign a document such as a will or deed. If a signer was unable to write his or her name, a mark was used instead. However, a full signature should not always be taken as a total indication of literacy, as some people learned to sign their names without being able to write anything else. It was also possible that a person using a mark to sign a document possessed some reading skills.

The books owned by a settler can be another indication of literacy. Many people learned to read the Bible but nothing else, using a familiarity gained in church to follow the words. A settler who possessed other books as well was most likely fully literate.

Reformation

The word *reform* (from the Latin *reformāre*) simply means to change something by making it better. In referring to *The Reformation* proper (or Protestant Reformation), we are describing the ecclesiastical protest of the Roman Catholic Church during the sixteenth century. The enormity of this religious event and its far-reaching implications for the world is second only to the inauguration of the Christian church in the first century.

Europe was ripe for such a change, for the Reformation occurred in the heart of the Renaissance, a cultural reformation of art, science, literature, political and social thought, and technology. The feudal system was slowly waning while the middle class was waxing as a social and political force. It was in this spirit of cultural change that Johann Gutenberg invented a process of printing with movable type, which was essential to the success of the Reformation. For example, because of Gutenberg's invention, Desiderius Erasmus was able to publish his Greek New Testament in 1516, which marked a decisive return to the Scriptures.

Many figures are associated with the Reformation, but three pillars emerge as foundational. Martin Luther was a Catholic monk who, while striving for his own salvation, also became caught up in a struggle against the abuses in the Roman Catholic Church. He specifically attacked the selling of indulgences, a moneymaking scheme concocted by the papacy whereby an individual could, in effect, win “pardon” for a temporal sin by buying off the Church. Luther outlined his criticisms in his “Ninety-five Theses,” which he posted on the door of the castle at Wittenberg, Germany, in October 31, 1517. The theses were translated, printed, and widely distributed and are considered to mark the beginning of the Protestant Reformation (or, more specifically, the Lutheran Reformation).

Ulrich Zwingli, a Catholic priest, launched the Reformation in Switzerland. He was a close associate of Erasmus and was influenced by the Greek New Testament. Zwingli began his religious reform not by composing theses but by preaching expository sermons in his parish in Zurich. The result for both priest and parish was a return to a more primitive Christianity and a rejection of papal doctrines that lacked scriptural support. Zwingli's reform quickly spread to neighboring areas around Zurich and, by the early 1500s the Swiss Reformation was well under way.

John Calvin was born in Picardy, France, in 1509, and—like Luther and Zwingli—was trained for the priesthood. At some time during his studies in France, Calvin underwent a conversion, probably under the influence of French reformers or his professors. He then began to study Scripture and the theology of the Reformation. In 1536, he published the first edition of his most widely acclaimed work, *The Institutes of the Christian Religion*, which was the first systematization of reformed theology. Later, Calvin became the religious leader in Geneva and therefore continued Zwingli's Swiss Reformation. More than Zwingli or Luther, Calvin has had the greatest impact on the Protestant churches in Europe and America.

From centers in Germany and Switzerland, the ideals and theology of the Reformation spread to Scotland, England, the Netherlands, and France. Scotland became Presbyterian, and England became Anglican. The Puritans, who struggled for church reform in England and hoped to work their religion into all aspects of life, transported Protestantism to America in the 1600s.

The Protestant Reformation was a reaction to the perceived excesses of the Catholic Church in sixteenth-century Europe. Two central figures, Martin Luther and John Calvin, are portrayed in this engraving. Protestantism was brought to America by the Puritans. (Bibliothèque de l'Histoire du Protestantisme, Paris, France/Bridgeman Art Library)

Although the principles of the reformation are widely debated, a few basic protests of the reformers are significant:

The first protest was aimed at the abuse of papal authority. The reformers rejected not only the selling of indulgences and a merit-based system of penance but also the elevation of the pope as the head of the church. For the reformers, Jesus Christ was the only authority over the church.

The reformers championed a return to the authority of Scripture (*sola Scriptura*) as the only rule for the life and work of the church. They advocated that the Bible be translated into common languages so that all could engage in its study.

The reformers also protested the exclusivity of the priesthood and argued that all of God's people have a divine calling to a particular vocation. This idea worked itself out in the laity's involvement in church ministry.

Finally, salvation of the individual was seen as a gift from God that could come only by God's grace through faith (*sola fide*). The idea that people could be saved by their own works or merits was rejected.

Regulators

In the middle of the eighteenth century, the backcountry of the Carolinas was filling up with wave upon wave of immigrants. Colonial political leaders,

oriented toward the colonies' eastern areas, often drew up gigantic, inconvenient counties, forcing those who inhabited the backcountry to travel many miles to participate in government or lodge complaints about taxation and other matters. The backcountry was equipped with few courthouses and jails, and crime, particularly cattle theft, was widespread.

The western portions of the two colonies had been entirely dominated by the older, established eastern portions. Colonial governors stationed in the eastern regions appointed relatives and friends to posts in the western counties, further widening the gap between the more settled East and the frontier West. As a response to these inequalities, "Regulator" movements sprang up in both North and South Carolina in the 1760s.

South Carolina's Regulation Movement

People living in South Carolina's backcountry had a long list of complaints against the colonial government. There were no courts, so people had to travel all the way to Charles Town to deal with legal issues. They were also underrepresented in the colonial legislature.

In 1766, a crime wave inundated the Carolina backcountry. Roving bands of criminals harassed the population and often used coercion and torture to learn the whereabouts of money or valuables. Tavern keepers and store owners were particularly susceptible to this sort of violence; if they refused to aid or supply the gangs, they ran the risk of having their stores and taverns burned, occasionally with them inside. A few of the outlaws were captured and sent to Charles Town for trial. Six were convicted, but five of these were pardoned by a newly appointed governor, desirous of beginning his administration on a generous note.

In 1767, these gangs of criminals picked up where they had left off. Across the colony, individuals took matters into their own hands. Soon local people began to fight back against the outlaws. A sort of civil war broke out in the backcountry between people looking to "build communities and those who wanted to destroy them," as one historian has put it. As reports of the violence and vigilantism reached Charles Town, the governor, viewing the vigilantes as an unruly mob, ordered them to return to their homes. This action further demonstrated how out of touch the Charles Town government was with the backcountry.

By October 1767, the vigilantes had taken on a more regular form and had grown in strength. It is important to note that the Regulators were often drawn from the backcountry's leaders; until relatively recently, historians tended to consider them a sort of frontier rabble. In fact, they were almost all property owners, and their leaders were wealthy, slave owning planters. They craved law and order, and in late 1767, they sent their requests, twenty-three of them in all, to the colonial legislature. The Regulators demanded courts, courthouses, jails, and schools. They also berated the legislature for its recent purchase of a statue of William Pitt.

The legislature responded by creating two companies of rangers (deputizing the Regulator forces already in the field) and a circuit court system for the backcountry. By 1768, the Regulators, now paid by the colony, had hunted down many outlaws in both North and South Carolina, sent them to trial, and witnessed the execution and branding of some of the more notorious among them.

With the outlaws dispatched, the Regulators turned their attention to other groups, such as vagrants and poor people. In 1768, they established the Plan of Regulation, an essentially reactionary document. The Regulators controlled South Carolina from Cherokee territory to within 50 miles of the coast. They performed a variety of services, from tracking down husbands who had abandoned their families to collecting debts.

The Regulators legitimized their position at the top of backcountry society, and though they did secure additional seats in the colonial legislature for the region, they began to rub some people the wrong way. They abused their power and often used their authority to settle personal scores. The Regulator movement in South Carolina was swept up in the larger movements both toward and away from independence from Great Britain in the 1770s.

Regulation in North Carolina

Regulation in North Carolina took a tone similar to the process that occurred in South Carolina, with one major exception: It was much more violent.

The inequalities faced by backcountry settlers in North Carolina were not as gross as those in South Carolina, but the region was terribly underrepresented in the legislature and bore the burden of unfair taxation. A group of concerned settlers drafted a document in 1766 known as Regulation Advertisement Number One, which sought to balance these inequalities and grab the attention of the colonial government. Authorities largely ignored the petition, and, in 1768, a formal Regulation movement took hold. The North Carolina Regulators agreed not to pay their taxes until the government recognized the unfairness of the situation and did something to address backcountry grievances.

The grievances of backcountry folks in North Carolina also had to do with the conduct of local officials, whom they viewed as irretrievably corrupt. No local officials in the rapidly expanding western part of the colony were popularly elected; they were all appointed by the colonial government, stationed near the coast at New Bern. Frontier dwellers also resented the fact that many local officials held multiple offices and drew multiple salaries. Another bone of contention between the colonial government and the backcountry Regulators was the mansion being constructed by Governor Tryon. Known as the "Palace," it was built under the supervision of John Hawks, a leading English architect, at a cost of 15,000 pounds to the taxpayers of the colony.

In 1771, the British governor of North Carolina, William Tryon, put down a revolt by backcountry “Regulators” over the oppressive rule and corruption of local officials and the use of taxes to build a new governor’s mansion. (Brown Brothers, Sterling, Pennsylvania)

In 1768, the Regulators drew up Regulator Advertisement Number Four, which delineated their plan of action more clearly. They resolved not to pay taxes and not to pay local officials’ fees. The Regulators also agreed to meet periodically as a sort of alternative legislature and to pool resources to defray necessary expenses.

Rioting followed the 1768 petitions, and several Regulator leaders were jailed for allegedly inciting the riots. Interestingly, the rioters targeted local officials, whom they saw as particularly corrupt. In South Carolina, the initial movement was directed against criminals; in North Carolina, the Regulators attacked the government. Their leading followers promptly stormed the jails and freed those who had been imprisoned, setting up a showdown with Governor William Tryon.

In 1771, Tryon raised a militia force of about 1,500 to march into the backcountry and restore order by putting down the Regulators. The Regulators, with about 2,000 men, met the militia in the brief battle of Great Alamance Creek, in which a handful of men on each side were killed. Six Regulators were eventually caught and hanged, but most of the rest received pardons. Many Regulators chose to emigrate from North Carolina to the far west, to what would eventually become the state of Tennessee.

The Regulator movement in the Carolinas was one of a number of conflicts between established Eastern colonial governments and their unhappy subjects in the backcountry. Like the Paxton Boys movement in Pennsylvania, it demonstrated the tension between the frontier and the coast. It also illustrated the conflict that could arise when areas in the West grew more rapidly than those in the East.

Religion

Religion, which is to say, essentially, Christianity, figured mightily in the European settlement of North America. Personal commitments to build a godly society, escape persecution, or proselytize the “heathen” impelled individuals by the tens of thousands to cross the Atlantic, while national religious identifications helped fuel monarchs’ determination to quash the imperial ambitions of their “heretical” or “papist” rivals. Nevertheless, in none of the territories claimed by the major European combatants did organized churches resembling those of the homeland appear quickly, if at all, although the Catholic powers—Spain and France—erected systems of missions and *reserves* for converted natives.

In seventeenth-century Anglo-America, the spawn of Protestant England, only New Englanders erected a stable church order; in the South, most settlers lived outside any congregation. That situation changed significantly during the eighteenth century. The migration of non-English Europeans increased the colonies’ ethnic diversity and, concurrently, their religious pluralism; scattered churches consolidated themselves into permanent denominations; a major mechanism for recruiting the mass of unchurched settlers—the evangelical revival—took root; church membership grew apace; and an increasing percentage of European Americans styled themselves true Christians.

Pluralism and Christian identity had their limits, however; colonists dismissed the faiths of Native Americans and of African slaves. For their part, most native peoples rejected the cross and militantly defended their own faiths. African Americans, struggling to salvage what shards of their traditions the Middle Passage had spared, remained almost entirely outside Christian orbits until the nineteenth century.

Religion also played a role in the American Revolution. Many churchgoers understood rebellion as the godly duty to defend themselves from British corruption and perceived the republic as the political embodiment of Protestant values. At the same time, the framers of the Federal Constitution and Bill of Rights took pains to recognize the rights of religious minorities. The colonial and revolutionary experience deeded to future Americans the dual and potentially discordant images of the United States as both a nation “under God” and a haven for religious freedom.

European Background and Non-English Settlement

European colonization began against the backdrop of medieval Christendom’s fragmentation. Inaugurated by Martin Luther’s promulgation of his Ninety-five Theses in 1517, the Protestant Reformation challenged Roman Catholic theology, liturgy, piety, and ecclesiology across a wide front. From Protestants’ fundamental principles of *sola fideism* (sinners are judged by their faith alone, not for any merit accruing to their deeds) and *sola scriptura* (the Bible is the only authority for salvation) derived two important corollaries: The priesthood is neither a superior order nor a requisite means for salvation, since individuals guided by Scripture have access to God without clerical mediation, and most Catholic ceremonial practice is false, because it lacks biblical sanction.

Protestants themselves were divided on many issues, such as how much power to accord the laity in running the church and the state in overseeing it. Those known as Reformed Protestants (or Calvinists, after the leading theologian John Calvin) were more willing than were Lutherans to grant the male laity substantial authority in exercising discipline over their congregations and to assert the church’s independence from state control in all matters pertaining to theology and worship. Calvinists also declared that magistrates wield power by God’s authority and have an obligation to protect the true church, for which duties the people owe them full obedience—except when they transgress divine law, in which case God ordains their overthrow.

The Protestant Reformation galvanized the Roman Catholic Church to address the conditions that had precipitated schism. Although affirming traditional dogmas, the Catholic Church sought to improve the clergy’s education and heighten the importance of individual (as opposed to collective) devotions; it also launched a number of new clerical orders, most notably the Jesuits, dedicated to rolling back Protestantism.

European Religions, North America, 1750. *The above map shows the various Christian (and Jewish) sects in the thirteen colonies in 1750. This diversity reveals one of the primary reasons the founders of the American republic decided against the establishment of a state religion.* (Carto-Graphics)

By 1600—the eve of Europe's permanent settlement of North America—the Catholic Church had stabilized its control over much of the Continent, while Protestants appeared more frequently the farther north and northwest one went. This latitudinal religious topography combined with a longitudinal economic and racial one—colonizing was a western European activity—and with a general theory concerning the relationship between religion and the state to shape the contest for the “New World.”

Since the Roman Empire had adopted Christianity as its official faith in the fourth century, convention held that a state should prescribe religious uniformity, for to countenance multiple beliefs invited political and social discord. Spain's national church was Catholic, as was France's (although a Protestant minority, the Huguenots, fortified towns along the Atlantic Coast), while the United Provinces (the Netherlands) embraced Reformed Protestantism, and England developed a Protestant Episcopal church. Where these powers were successful in establishing settlements would profoundly influence North America's religious geography.

Attempting to protect the wealth of Mexico and Central America, the Spanish flung outposts across the northern extremities of their American empire in an arc running through modern Florida, Texas, New Mexico, Arizona, and California. The church participated integrally in the Spanish scheme to conquer and convert the native peoples. Hence, in the Borderlands, where remote, impoverished garrisons attracted few colonials, it characteristically took the form of missions staffed by members of the Franciscan order who ministered to native peoples, rather than parishes occupied by “secular” priests who served European Americans. Mission compounds (*doctrinas*) centered about a sanctuary, surrounded by outbuildings, fortifications, and natives' fields. Spanish colonization expropriated native labor whenever possible. While the church often succeeded in mitigating the worst exploitation, the missions themselves depended on it.

The Spanish launched three major campaigns in the Borderlands. In northern New Mexico, as early as 1630, twenty-five missions included 25,000–30,000 Pueblo peoples. In Florida, two lines of *doctrinas*—one running north along the Atlantic coast, the second reaching west toward the Panhandle—reached perhaps 60,000 people by 1634. And in California, as a result of a campaign initiated in 1769, total conversions reached perhaps 100,000.

In the long run, however, the devastation of native populations by epidemic disease, aggression by European and indigenous foes, and resistance by the mission Native Americans themselves diminished Catholicism's presence in the region. The Timucuan Revolt of 1656 weakened the central Florida missions; fifty years later, the English, with their Creek allies, collapsed the entire system. The California missions disappeared when Americans swarmed

into the territory in the mid-nineteenth century. Only in New Mexico—and only after the Spanish had suppressed the Pueblo Revolt, which expelled them from the region between 1680 and 1692—did the missions establish a lasting group of Catholic indigenes. With the exception of Maryland, Catholicism came of age in the United States only in the nineteenth century, long after Protestantism had established the cultural ground rules.

In New France, parishes of European American Catholics arose alongside—but ecclesiastically, politically, and culturally segregated from—Native American churches. Proselytizing the native peoples was a major goal in New France, especially after Cardinal Richelieu, head of the Royal Council of State, reorganized the faltering colony in 1627. But because neither the Crown nor the mercantile companies that promoted French colonization could afford to send clerics, responsibility devolved upon the religious orders themselves.

The most effective missionaries during the seventeenth century were the Jesuits, who paddled hundreds of miles to preach the Gospel in Huron and Algonquin villages. As warfare with the Five Nations of the Iroquois forced tribes from ancestral homes, the French established *reserves* for Christianized Native Americans, who obtained educational and medical services from nuns like the Ursulines, the Hospitallers, and the Sisters of Charity—a female religious presence unique in colonial North American history.

The Jesuits claimed to have baptized 16,000 souls from 1632 to 1672, only a minority of the native population, but the ministrations of the Catholic orders, male and female, played a critical role in New France's survival. The good relations they fostered with native peoples facilitated the trade in furs, New France's signal export commodity, and military alliances, on which the colony's existence depended.

The parochial church took longer to organize. Not until 1674 did the pope appoint a bishop, and only in the eighteenth century were the majority of priests themselves colonial-born Creoles. Operating in different intellectual and social contexts, the Canadian church departed in some ways from French norms. Less defensive about Protestant polemics and relatively untouched by Enlightenment skepticism, the clergy preached—and, far more than their European peers, practiced—the moral rigor characteristic of the French Catholic Reformation. They also presided over congregations of independent landowners, who paid lower tithes than did French peasants. The landowners' sense of autonomy led to practices—such as a casual view of when it was necessary to baptize one's child—that prompted chronic clerical scolding. Nevertheless, the laity heeded their priests (conceptions plummeted during Lent, for instance) and gave the church their full loyalty. Catholicism became a major marker of French Canadian identity after Britain took over New France in 1763.

Leery of settling too close to the Spanish, who had massacred one settlement in 1565, the French left a thousand-mile gap between themselves and their Catholic rivals, a territory that was open to Protestant occupation. The Dutch seized the opportunity to sprawl New Netherland across the Hudson and Delaware Rivers. Commerce, not religion, drove Dutch colonization, reflecting a sentiment common in civic and mercantile circles that toleration preserved comity and commerce more readily than did religious exclusivity.

By 1600, most of the Dutch Republic's seven provinces in Europe had recognized the supremacy of the Reformed Church. Although the *predikanten* (preachers) of the Dutch Reformed Church urged the state to impose uniformity, the magistrates' unwillingness to cede power to the clergy, coupled with merchants' fears that enforcing doctrinal orthodoxy would hurt trade, frustrated the ministers' hopes. Known for its toleration, the Netherlands attracted Jews and Protestant dissenters from across Europe.

These attitudes carried over into New Netherland, where the Dutch Reformed Church had little influence. The ruling West India Company preferred making profits to saving souls. It sought to dampen religious controversy in order to maintain political stability and welcomed anyone who would settle, regardless of their faith. As late as 1650, only two Reformed congregations, 150 miles apart, served the colony.

Peter Stuyvesant, New Netherland's longest-serving and most competent director-general, did try to implement a policy of religious uniformity in the 1650s, but the company overrode his plans to expel Lutherans, Jews, and Quakers. The Dutch Reformed Church gained greater cultural authority among ethnic Dutch settlers only after England conquered the colony in 1664, by which time the newly named province of New York had gained a reputation for religious heterogeneity.

Seventeenth Century

The notion that religion in Anglo-America enjoyed a “golden age” in the seventeenth century comes from two perspectives, both of which focus overmuch on New England. The scholarly version comprehends Puritanism as a tightly argued intellectual construction that declined in the century following the founding of Massachusetts under the pressure of internal contradictions, social change, and secularization. The popular variant focuses on the intensity of Puritan spirituality, declares America to have been founded on Christian principles, and laments the present's alleged falling away from the faith of our fathers.

Both stances are flawed. The first essentializes Puritanism and fails to track how it adapted to America. The second perspective imputes the prevailing minority's piety to the entire population and misses how ecclesiastically unique seventeenth-century New England was. More accurately, religious authority outside New England struggled to assert itself. Churchmen did not exercise their accustomed power, the majority of colonists attended services sporadically, if at all, and unorthodox beliefs infiltrated popular practice.

At the same time, the outlines of a distinctive American religious culture began to take shape. This was based on more extensive lay governance than existed in Europe, a greater variety of churches from which to choose, religious affiliation increasingly dependent on individuals' voluntary choices rather than on custom, decree, or family habit, and, in many places, the state's inability (even unwillingness) to enforce religious uniformity.

Although their theological commitments varied, English monarchs from Henry VIII (r. 1509–1547) to Charles I (r. 1625–1649) dreamed of erecting a national church to which all subjects belonged. None of them achieved that goal, however, and the Church of England's failure to include all the king's men (and women) dogged efforts to realize it in the colonies. The church that emerged adopted a Protestantized worship that nevertheless retained Catholic practices (such as allowing priests to wear ornate clerical garb); it also inscribed Reformed theology into its creeds without encouraging Calvinism's disciplinary apparatus or its scripturalism.

This “middle way” angered both loyal Catholics (recusants), who detested any departure from the “good old religion,” and the “hotter sort of Protestants.” The latter were derided as Puritans, although they denominated themselves the “godly”; they maintained that the Church of England had neither

sufficiently purged itself of "Romish" practices nor effectively instituted a Reformed ecclesiology. In the interest of achieving uniformity, the government suppressed the Catholics, sometimes lethally, and periodically harassed the Puritans.

Unlike the Catholic Church in Spanish and French dominions, the Church of England did not deeply involve itself in seventeenth-century English colonizing efforts, which were undertaken by private parties—mercantile companies or aristocratic proprietors—not the Crown. Nor did it work actively on its own behalf. Internal conflicts over its constitution, theology, and liturgy, culminating during the 1640s and 1650s in the attempt to institute a presbyterian form of government, distracted it from organizing its American dominions. Meanwhile, Puritans, Catholics, and Quakers, fleeing religious turmoil, set up their own churches. In places like New England, these dissenters vastly outnumbered the established church's own adherents.

Virginia, the first permanent English colony, formally established the Church of England as early as 1619. Governor William Berkeley expelled Puritan dissenters in the 1640s, but no one in England took permanent responsibility for managing the church until the Bishop of London did so in 1677. By this point, the Old Dominion's laity had arrogated substantial power to themselves.

In the absence of a presiding bishop, the House of Burgesses watched over the clergy's behavior and created lay vestries that took care of the congregation's property, levied ecclesiastical taxes, and chose the clergyman they wanted the governor to install, a liberty unimaginable in England. As the Crown rationalized English imperial administration late in the century, the Bishop of London in 1693 installed a commissary, his personal representative, to try clergy for malfeasance, oversee their parishes, and convene them to discuss church business. The lay vestries, however, retained their authority, and the church never seated an American bishop.

Elsewhere, the Anglican Church lay thin on the ground. One minister complained in 1676 that Maryland's three "conformable" clergy could not possibly take charge of an estimated 20,000 souls. Hence, the colony had become "A Sodom of uncleanness." In New England, the state church played the unaccustomed role of minority dissenter to the most powerful ecclesiastical organization in colonial Anglo-America, Puritan Congregationalism.

In his pamphlet *The Wonders of the Invisible World* (1693), the influential Puritan clergyman Cotton Mather offered an account and defense of the Salem witch trials. Mather's teachings epitomized the strict Puritan orthodoxy of seventeenth-century New England. (Library of Congress, LC-USZ62-75554)

Puritanism is best understood not as a theological system but as a religious temperament centered around the experience of conversion (the New Birth in which the Holy Spirit regenerates the soul by grace). As such, it is fashioned within Reformed Protestant theology and dedicated to morally reforming society through the collaboration of ministers, magistrates, and laity. Puritanism took root in, as one historian has remarked, a "mood of sour discontent" with the Church of England's incomplete reformation. For some six decades thereafter, the Puritans remained (with the exception of a few hundred Separatists) within the church, while setting themselves apart from their less godly neighbors in closely knit groups committed to prayer, study, and moral improvement.

The ascendancy during the 1620s of an Arminian clerical clique, who subscribed to a nonorthodox theology of grace and a sumptuous liturgical style hugely at odds with the Puritans' preferences for plainness, helped precipitate the "Great Migration" to New England. The Puritans emigrated to this New World to form what Massachusetts Governor John Winthrop christened the "City upon a Hill," a society that, like ancient Israel, had collectively entered into a national covenant with God. Its members would perform all of God's commandments and, for their obedience, he would bless their enterprise.

In what might be called the “First Puritan Reformation,” the founding generation of settlers constructed what they considered a biblically sanctioned church order. Far from implementing a theocracy (a state governed by religious authority), it delegated responsibilities for its maintenance to its three sociological constituents: The clergy would define doctrine, rulers would enforce religious uniformity, and families would patrol their neighborhoods to enforce moral standards.

Under this system, encoded in the Cambridge Platform of 1648, the male laity, not an ecclesiastical hierarchy, held the power to create new churches. They did this by voluntarily gathering regenerate “Saints” (those who had experienced conversion), calling for the minister, and, with their pastor, judging who should be admitted or expelled.

The survival of the City upon a Hill was predicated, Puritans believed, on the continued existence of a godly majority, committed to suppressing dissent and upholding moral norms. From a historical perspective, we can determine that it also depended on a population characterized by relatively little occupational differentiation or inequalities of wealth, a group bound together both by strong social networks and by high levels of ideological commitment.

By the later seventeenth century, changing conditions were undermining these prerequisites. Families seeking land broke away from town centers, religious dissenters (Quakers, Baptists, and Anglicans) claimed the right to form churches, piety among the second and third generations flagged, economic change precipitated the appearance of a “counterculture” of festivity contemptuous of the Saints’ highhanded righteousness, and imperial authorities increasingly intruded into colonial affairs. In the face of these challenges, ministers launched the “Second Puritan Reformation,” an effort to recover the presumed godliness of the first generation in circumstances (such as the loss of the Massachusetts charter in 1684) that made the old moral alliance of ministers, magistrates, and laity increasingly difficult to sustain.

The ministers’ program took various forms. They applied a rhetorical style, called the “Jeremiad,” urging magistrates to continue supporting the church and the laity to tighten family government. They proposed innovations to the sacramental system that allowed a greater number of people to undergo baptism or take the Lord’s Supper. A concerted effort was made to suppress, or at least rein in, the counterculture. They also experimented with various devices—covenant renewal ceremonies, a more emotional homiletic style—to revivify piety and excite large numbers of people to experience the New Birth concurrently. The Saints never recaptured their majority status, and the British government ultimately forced them to tolerate other churches, but the Congregationalists continued to dominate New England’s cultural and religious life throughout the eighteenth century.

While Virginia, Massachusetts, and Connecticut strove (with varying degrees of success) to impose religious uniformity, three colonies took the step—radical for the seventeenth century—of promoting religious liberty. The Calvert family founded Maryland in 1632 as both a refuge for English Catholics and a proprietary domain from which they hoped to profit. Since Protestants comprised the vast bulk of English people, the Calverts encouraged them to settle, promising that they might worship as they pleased. In 1649, the Maryland assembly codified such an arrangement in an Act Concerning Religion, which assured that authorities would trouble no one professing any form of Trinitarian Christianity.

Roger Williams developed a more liberal policy for Rhode Island, which he founded in 1636 after Massachusetts had banished him. Williams believed that papal corruption had broken the apostolic succession and so made constituting any pure church impossible until Christ’s return. Consequently, the state had no business either supporting any church (since none warranted its aid) or punishing dissent (since none could claim to hold the truth). Rhode Island soon attracted dissenters unwelcome in either Old or New England.

Similarly disposed to Williams, Pennsylvania’s proprietor, William Penn, based his apology for religious liberty on Whig theories of personal liberty and Quaker doctrines of the “inner Light,” that is, the divine spark that all human beings possess and that no government has the right to coerce. Forced worship both “stinks in God’s nostrils,” Penn declared, and works contrary to its political intentions by alienating subjects from rather than bonding them to their prince. These attitudes grounded Pennsylvania’s policy of permitting all theists to worship as they wished, although laws forbade Catholics from holding office.

Few colonists heeded the experiments in Rhode Island or Maryland. Rhode Island’s reputation as a sectarian sinkhole and, during the Revolution, a political pariah isolated it; while in Maryland, Protestants stripped Catholics of their political rights in the eighteenth century. Pennsylvania’s growing wealth, however—it quickly earned the sobriquet “the best poor man’s country”—provided a widely noted counterexample to the ancient notion that only religious uniformity could underwrite prosperity.

Eighteenth Century

Christian institutions and beliefs solidified their presence in Anglo-America during the century following 1680. The number of Protestant churches multiplied and consolidated themselves into recognizable denominations. Presbyterians organized their first presbytery (a court composed of local ministers and lay elders) in 1706 and their first synod (a council of representatives from presbyteries) a decade later. Quakers erected a hierarchy of meetings—weekly, monthly, quarterly, and yearly—and corresponded with similar bodies in Britain. Particular (Calvinistic) Baptists put together the Philadelphia Association in 1707. And the German Reformed churches adopted a *coetus* (an administrative gathering of ministers and elders) in 1747.

Nevertheless, large numbers of people—especially Eastern Woodlands natives and African slaves—remained virtually unincorporated. To recruit unchurched European Americans (and, to a far lesser extent, people of color), ministers in several denominations fastened upon the revival. These mass meetings, in which preachers, using highly emotional language, exhorted audiences to accept Christ immediately, served as a mechanism that might catalyze hundreds of conversions at once.

These developments elaborated on but did not substantially alter patterns previously laid down. Many colonies granted certain churches taxation privileges, but nowhere—neither in the South, where provincial legislatures from Maryland to Georgia formally established the Church of England, nor in much of New England, where the Congregational churches predominated—did a single church holding monopoly privileges over taxation and attendance prevail. Rhode Island, Pennsylvania, Delaware, and New Jersey erected no such establishments at all, although most colonies did restrict office holding to certain groups.

The ideas of Roger Williams and William Penn notwithstanding, most colonists did not regard religious freedom as a positive value. In some instances, religious majorities sought to curtail the activities of minorities. Examples include Anglican persecution of evangelicals in the Southern interior and

Congregational harassment of Anglicans, Baptists, and Quakers in New England.

Nevertheless, in most places, a "grudging toleration" prevailed. Moreover, even though the churches bickered with, competed for converts against, and occasionally tried politically to hamper each other, colonists constructing their religious identities in opposition to Britain's enemies considered themselves as resolutely Protestant. To their minds, Catholicism nurtured not only doctrinal error but also subservience to the papacy, political authoritarianism, and tyranny, evils that would befall them should the world's freest empire—in the sense of allowing its subjects basic freedoms and limited self-rule—falter.

Religious diversity emerged in part from divisions over theology, liturgy, and devotional styles, such as the Baptist schism from New England Congregationalism, or from the appearance of such new European traditions as Methodism. The major factor, however, was immigration. Most eighteenth-century migrants traveled from parts of the British Isles other than England, and from northwest Europe, Africa, or the West Indies; ethnicity and national origin frequently correlated strongly with religious affiliation.

The preferred church government of perhaps half a dozen seventeenth-century congregations, Presbyterianism, grew rapidly in the Mid-Atlantic colonies with the arrival of Highland, Lowland, and Ulster Scots. A few thousand Huguenots expelled from France by the revocation of the Edict of Nantes in 1685 ultimately found their way to Massachusetts, New York, and South Carolina, although by mid-eighteenth century, they had merged with the Anglicans. The largest European American exodus issued from southwest German states, strewing Lutherans, German Reformed, and various sectarians—Mennonites, Schwenkfelders, Moravians—across the Mid-Atlantic provinces (especially Pennsylvania) and the Southern interior.

The rising number of non-English European Americans and of African Americans fostered pluralism, albeit of a decidedly Protestant cast. Britain's Protestant identity and the colonists' virulent anti-Catholicism kept the number of Catholics to a bare minimum. Although Parliament allowed the colonies (but not the home country) to naturalize Jews, only a few thousand resided there.

Pluralism had other limits as well. Despite sporadic missionary efforts, Native Americans, for the most part, remained outside colonial churches. Eastern Woodland religious beliefs traversed an axis radically different from that of Christianity, which construes the central relationship between people and God in terms of sin and redemption: Human sinfulness, both innate (original sin) and volitional (specific transgressions), indicts every individual and requires Christ's intercession for eternal life. Native Americans, on the contrary, did not conceive a radical split between "natural" and "supernatural" realms. Instead, they interacted constantly with myriad spirits that conferred or withheld "power" (the Algonquin word is *manitou*), the ability to grow or catch food or kill enemies. A life well lived consisted in navigating the natural world in such a way as to maintain cordial relationships with all of the power-giving spirits, thereby maintaining one's health and strength.

Notions of proselytizing the natives appeared at the outset of English colonization. The seal of the Massachusetts Bay Company even featured a Native American saying, "Come over and help us." Despite some major efforts, such as John Eliot's project of founding English-style towns and churches among the Massachusetts Algonquin and the Mayhew family's longstanding mission to the Martha's Vineyard Wampanoag, New Englanders generally were not interested in such conversion efforts.

The greatest success in Anglo-America came not from the English but from the German Moravians, who, in the eighteenth century, converted hundreds of Native Americans in Pennsylvania and the Ohio territory. Compared to Spanish and French efforts, however, Anglo-American proselytizing did not amount to much, thwarted as it was by the absence of royal involvement (the British monarchy never sponsored missions), the lack of means (exacerbated by the dearth of clerics who could free themselves from serving their own congregations), and, most importantly, the Native Americans' resistance, both passive and active.

Most native peoples spurned the Gospel message, because it required them to renounce their own deities or because they did not witness European American Christians practicing what they preached. Quiet dismissal turned to violent rejection as the Anglo-American population doubled each quarter-century, pressuring Native American lands and catalyzing native "revitalization movements." Native "prophets" diagnosed their peoples' debilitation as the result of embracing European American goods and their god; utter renunciation of these influences was prescribed as the only means of reacquiring spiritual power and tribal strength. One such movement, "Pontiac's Rebellion," ravaged the western frontier in 1763, and others dogged American expansion throughout the nineteenth century.

Africans lay equally outside Anglo-American Protestantism. Slavery's solution to the colonies' habitual labor shortage and its consequent pervasiveness, particularly in the South, spurred imports. By 1775, half a million African Americans, virtually all of them slaves, inhabited the colonies. The West African peoples who "provided" most of these slaves practiced a number of religions. Some had converted to Islam, but most believed in a High God, who remained distant from human affairs, and a multitude of lesser divinities, including one's ancestors, who involved themselves deeply in human affairs and had to be ritually appeased.

The Middle Passage ripped slaves from ceremonial observances and their sustaining kinship networks, prohibiting their replication in America. Recent captives might reinvigorate memories of specific African traditions. As the mainland slave population began to sustain itself by the later eighteenth century and importations directly from Africa declined, however, African Americans lost direct knowledge of their homeland. "The gods of Africa died," as one historian put it, but the broader African religious background did not. Spirit possession, accompanied by spiritually passionate singing and dancing, would eventually resurface in African American Christianity and infuse evangelical Protestantism.

Nevertheless, colonial missionaries reached fewer slaves than they did Native Americans. Strongest in the South, where most slaves lived, the Church of England initiated the most substantial effort, but it faced numerous obstacles. Imbued with a sense of their racial and cultural superiority, missionaries did not warm to their task and had trouble communicating with people who knew little or no English. Also, planters, many indifferent to Christianity, did not like losing their laborers' time and feared that the spiritual equality with masters implied by baptism would instigate slaves' indolence, sauciness, and rebellion.

It would be evangelical Protestants, particularly Methodists and Baptists, who took the conversion of African Americans seriously. Their activity began during the Revolutionary era, when blacks made up perhaps a quarter of their adherents in the South, but the full-fledged "plantation mission" took place only in the nineteenth century. Before then, the majority of slaves remained outside Christianity.

The presence of evangelical Protestants in the late-eighteenth-century South was largely due to the invention of revivalism. During the Second Puritan

Reformation, ministers searched for ways to quicken the rates of conversion and recruit church members en masse, rather than waiting for the Spirit to work on individuals ad hoc. Solomon Stoddard of Northampton, Massachusetts, discovered the solution: a "season of refreshing," during which hortatory sermons, including invocations of hell (extremely rare among earlier Puritans), drew dozens into the church and improved the town's moral comportment (if only for a time).

A similar predilection for highly wrought preaching to stimulate the New Birth occurred in other Reformed Churches. Influenced by Pietism, a movement within German Lutheranism emphasizing the importance of personal feeling for spiritual living over assent to creedal formularies or the observance of ritual niceties, Theodore Jacob Frelinghuysen excited congregations in New Jersey's Raritan Valley during the 1720s. Based on precedents from a century earlier—when Presbyterians in Scotland and Ulster had celebrated the Lord's Supper at outdoor gatherings that occasionally sparked dozens of conversions—a group of ministers, gathered around William Tennent, lobbied the Philadelphia Synod in the 1730s to endorse "heart-religion" over doctrinal exactitude as the hallmark of Presbyterianism.

These local developments were subsumed in 1739–1741 by the "Great Awakening," which was catalyzed by George Whitefield. An ordained Anglican who, with John Wesley (Methodism's founder), pioneered the technique of "field preaching," Whitefield traveled throughout the colonies preaching the New Birth and eliciting enthusiastic crowds. The Awakening's manifest success in stimulating religious feeling led to the creation of two forms of revivalism. The first, theorized and practiced by Stoddard's grandson, Jonathan Edwards, took place in settled churches under the direction of their own pastors; the second followed Whitefield's model of an itinerant preacher converting the unchurched, who, in time, gathered new congregations. The Edwardsean type operated in New England, the region long accustomed to town settlements centered around church greens, but the Whitefieldian strain was far better suited to the dispersed and less ecclesiastically organized populations more typical everywhere else, and, for this reason, it became the American Protestant norm.

The English evangelist George Whitefield preached the "New Birth" to enthusiastic crowds throughout the colonies, helping to launch the religious revival known as the Great Awakening in the 1720s. (Private Collection/Bridgeman Art Library)

Revolutionary Era

American religious culture played a subsidiary role in instigating the Revolution, but a major one in constituting the new nation. One scholar has deemed the Revolution a "religious war," fought between the Anglican British state and colonial dissenting Protestants concerned more about losing their religious freedom than their liberty and property. This interpretation rightly recognizes that non-Anglicans formed a majority in the colonies as a whole (Anglicans predominated in the South), that they perceived any attempt to strengthen the colonial Church of England as necessarily endangering their own churches' autonomy, and that most of the Dissenters came out of Reformed Protestantism, which allowed the public to unseat transgressive rulers. Nevertheless, this argument wrongly assumes that eighteenth-century colonists identified themselves primarily as church members rather than as subjects heir to British liberty, fails adequately to explain why the majority of the Anglican laity (including George Washington, Thomas Jefferson, James Madison, and Patrick Henry) lined up with the patriots while some Dissenters joined the loyalists, and undervalues the political and constitutional issues that most agitated patriots. First and foremost, Americans fought for liberty and property.

Religion did, nevertheless, affect how colonists mobilized to rebel. For one thing, Reformed Protestantism formed an important element of the ideology of resistance; its standard themes about human sinfulness, the necessity of regeneration, the Christian duty to create a moral society, and God's never-ceasing governance of the universe intersected with "secular" ideologies depicting history as the incessant struggle to secure liberty against despots' drive to aggrandize power. The ingrained Protestant identity that had caused colonists previously to regard Britain as the bulwark of liberty against Catholic slavery now depicted the empire itself as equally tyrannical. Protestant ideology helped some colonists define the massive program of imperial reorganization that Parliament launched after 1763 as not simply a misguided attack on American rights but, more essentially, a manifestation of an eternally occurring type of corruption from which only independence could inoculate them.

Certain imperial actions disturbed colonists on grounds of interest as well as ideology. During the 1760s, some Anglicans, especially in the North (where the Church of England was weakest), lamented the absurdity of an episcopal church lacking a bishop and petitioned for an American see. Dissenters and Southern lay Anglicans protested. The former protested because they feared a bishopric as the first step to losing their religious freedom, the latter because they did not wish to cede their hold on church administration, and both protested because they regarded the plan as part of a larger conspiracy to deprive them of liberty. As the crisis over the Boston Tea Party spun toward war, Parliament recognized the Catholic Church in Quebec (whose European American population was almost entirely Catholic) without granting the French Canadians a legislature (which they did not want), firing Anglo-Americans' endemic anti-Catholicism and suggesting that Britain endorsed both authoritarian government and papism. Some people dreamed that the United States would create an utterly new society (a hope stamped into the Great Seal of the United States in the motto *novus ordo seclorum*—"a new order of the ages"). At some point, such thoughts helped convince colonists to revolt.

The settlement of religion—the formal acts and popular attitudes that realigned the relationship between church and state following independence—comprised one of the American Revolution's most radical consequences. The settlement exploded the notion that political stability and prosperity require religious uniformity, yet it did not completely wall off church from state. The American republic's system of dual federalism, which accorded the individual states substantial sovereignty over the national government, and Americans' identification of the United States as a "Christian" (by which they meant "Protestant") nation, mitigated against such absolute segregation.

Building upon the colonies' de facto toleration, the revolutionary rhetoric about the individual's "unalienable" rights, and the participation of every religious group on the patriot side, all of the state constitutions provided for religious liberty. At the same time, most states did not consider freedom of conscience to be incompatible with either publicly financing religion in general or imposing religious qualifications for office holding. Three New England states (which had a long-standing history of state support for churches) and five states in all made some provision for fiscally supporting religion.

In Virginia, however, a concerted campaign orchestrated by Madison among evangelical Protestants influenced the legislature to vote down a controversial general assessment bill that would have allowed each person to designate to which church (or, as an option, school) his tax proceeds should go "to encourage public order." This bill was rejected in favor of Jefferson's Act Establishing Religious Freedom, which prohibited any such arrangement, because it violated the individual's right to worship according to one's conscience.

Eleven states passed test acts limiting one group or another (most often Roman Catholics, sometimes non-Trinitarians, more generally) from office. Although such disqualifications are antagonistic to modern notions of religious liberty, they did not appear so at the time, because virtually all Americans held republican and Protestant values to be indistinguishable. So axiomatic did this equation appear that even Virginia, the only state besides Rhode Island to hold that any government action concerning religion infringed on religious freedom, passed a law in 1792 discouraging anyone's celebrating the Sabbath on a day other than Sunday; this was done without any apparent sense of inconsistency.

Defining their task as deriving a republican solution for the problems of a republican polity, the framers of the federal Constitution of 1787 shied away from any discussion promoting religion. Drawn from diverse Protestant backgrounds (although as a group they tended overwhelmingly toward rationalism, and only one might be considered an evangelical) and disinclined to promote the interests of any specific creed or denomination, they sought to create a national governing structure that would avert the sectarian discord they feared would corrode republican institutions.

Unlike the Declaration of Independence, which postulates rights as "endowed" in human beings "by their Creator," the Constitution locates the source of federal power in "We, the People," and does not mention any divinity—about which failure some contemporary Christians complained. The document takes up religion in only two places: It allows federal and state officers to affirm, rather than swear, their loyalty to the Constitution (a concession to Quakers, who objected to oath taking because they claimed that forcing them to swear implied that they never told the truth except under pledge), and it forbids any religious test for national office—a provision contrary to what most state constitutions provided.

Because opponents of ratifying the Constitution argued that it did not properly protect individual rights, the first federal Congress drafted ten amendments that eventually became the Bill of Rights. The First Amendment secured the "free exercise" of religion, as had the states, but it also dictated, "Congress shall make no law respecting an establishment of religion." Many colonial and state governments had legislated financial support for churches or passed test acts, but contemporaries generally concurred that the term "establishment" referred not to these sorts of arrangements but only to "an exclusive government preference for one religion." Working from this definition, the Bill of Rights, in concert with the Constitution, seemed to suggest that the national government possessed no authority in religious matters. In practice, however, interpretations varied.

Some Americans regarded presidential proclamations for Americans to hold fast or thanksgiving days as representing an unwarranted governmental intrusion into religion. (As president, Jefferson refused to issue them.) While to most contemporaries, such actions appeared so consonant with Protestant (i.e., Christian), hence republican, values that they seemed merely commonplace moral expressions, not partisan pieties.

Toward Nineteenth-Century Evangelism

Developments during the colonial and revolutionary eras grounded the nineteenth-century religious order. This was characterized by the removal of all constitutional impediments to full religious freedom, such as test acts; widespread Protestant acceptance that no denomination can call itself the one true church; acceptance of the voluntary principle that private contributions, not state funding, should support religion; the tendency, albeit not absolute, to keep government from intruding into religious matters; and the assertion that the United States was a Christian Protestant nation, a device that extended the Puritans' national covenant to the entire nation.

These patterns underlay the "evangelical surge" that transformed American religious life in the first half of the nineteenth century, resulting in rates of church membership higher than anything attained in the seventeenth and eighteenth centuries. They also created two discrepant visions of the United States: a Christian nation specially privileged by God, and a haven of religious freedom. The first view is exclusivist, the second more liberal. Modern advocates of each position argue that early American history credits their view alone. In fact, it endorses both.

Religions, African

African religions had a profound impact on the development of a distinct set of African American cultures in British North America, and their long-lasting effects are just beginning to gain the scholarly attention they deserve. The years to come will likely shatter many preconceived notions concerning African religions in colonial America. One trend is already apparent: Africans in America retained African religious traditions in one form or another for a much longer time than scholars had previously assumed.

Some African slaves had been exposed to some aspects of Christianity through their dealings with European and African Christians in Africa, so the process of religious change had deep roots. Before 1776, particularly in the years of the Great Awakening, many African Americans began to adopt some of the tenets of Christianity. They did so on their own terms, according to their own distinct historical experiences.

Religion in West and West Central Africa

Most African slaves came to mainland North America from West and West Central Africa, two vast and diverse regions. African religions in these two areas varied widely in how they explained the concepts of good and evil, salvation and creation, and how they viewed prophecy and possession. Still, most African religions shared a common set of underlying principles.

Most West Africans did not draw a formal line between the natural and the supernatural; they believed that ancestor spirits, responsive to the needs of their living relatives, could affect their daily lives. The supernatural world was revealed to human beings through various means, including revelation and divination. During the sixteenth and seventeenth centuries, Europeans believed in revelation as well, but Africans and Europeans disagreed about the

methods of receiving revelation and what specific revelations could be taken to mean. In many communities, illness or conflict was tied to problems in the spirit world. Most cultures believed in a creator (some had multiple creators), but creators and other “high gods” were not as relevant in day-to-day life as more localized spiritual beings.

African religions were pluralistic and dynamic, practical and adaptable. These characteristics gave African religions a fluidity and resiliency. This allowed African people to fit in new beliefs and deities in accordance with their particular situation, in this case, plantation slavery in the Americas.

In the sixteenth and seventeenth centuries, there were several sorts of revelation. Augury and divination relied upon the study of worldly events to define otherworldly intentions. One wide-ranging form of divination was the Yoruba tradition of Ifa, in which cowry shells were tossed on a special board. In the pattern made by the shells, the diviner found answers to specific questions. Similar divination rituals in other parts of Africa used teeth or bones to prophesy in a similar way. Dream interpretation was another way in which people gained access to the spirit world. People with special gifts also could hear voices or receive visions. The most intense form of revelation was possession. Spirits were capable of possessing animals, people, or objects to reveal their presence.

Mediums in Angola and Kongo were revered for their ability to convey the wishes of spirits. In Kongo, the *nganga ngombo* (spirit medium) would stand entranced in the middle of a ring of singers and deal with their spiritual concerns. In Angola, the *xingila* would enter a trance induced by clapping, drumming, and dancing. Although priests and mediums were powerful, their continued power was not assured; if they failed to produce results, they might lose their positions of esteem. Continuous revelation prevented any one African religion from gaining orthodox status and contributed to the multiplicity of religions.

Early European observers dismissed many African religious forms as witchcraft and the work of the devil. In fact, African religions and Christianity did not meet for the first time on American plantations. Many Africans had been exposed to Christianity in Africa. While the word “conversion” does not adequately describe the process that took place, some Africans had already begun to pick and choose Christian precepts and saints that appealed to them. This process would accelerate and expand in the Americas.

African Religions in America

Few events in human history have had the devastating impact of the trans-Atlantic slave trade. In the four centuries of the trade, more than 15 million people were forcibly removed from Africa; of these, approximately 10 million arrived alive in the Americas. In the slave fortresses and on the slave ships, Africans struggled against nearly impossible odds to maintain their faiths, at the same time as they cobbled together new religious identities with people from other parts of Africa. Africans from areas with strong localized religious tendencies, such as Senegambia, came into contact with people who worshipped more universal deities, such as the Aja nation on the Slave Coast.

Once settled on plantations, new bonds of community were forged from distinct ethnic identities. Slaves imported to Catholic areas proved particularly adept at merging Catholic saints with African deities. “Voodoo,” whose name is derived from “vodu,” the Dahomean word for “god,” is just one of several belief systems derived from mixed African and European heritage. This should not be confused with “hoodoo,” which was much more common in North America, and properly refers to a set of religious practices based on remembered West Central African traditions, not necessarily a well-defined system of belief.

The Carolina low country and the Chesapeake possessed the largest slave populations in British North America. In both of these areas, hoodoo and conjuring were extremely important to transplanted Africans. Slaves called on spirits and spiritual knowledge for a variety of reasons; they used traditional remedies to heal the sick, and they also relied on sorcery to harm their enemies, both black and white.

Slaves who had access to the world of charms and poisons were feared and revered in slave communities. White masters' fears of being poisoned by their slaves loomed large and were not unfounded. Slaves suspected of poisoning met harsh fates, including torture and death throughout North America.

Slaves also decorated their cabins and created art objects with items and patterns that could welcome positive spirits and ward off negative ones. Folk medicine and conjuring were closely related in the Southern colonies, and slave doctors, nurses, and midwives who could heal were valued by their African compatriots and English masters alike.

Funerary practice was extremely important to natives of West and West Central Africa, as it marked the passage from the world of the living to the world of the dead, and it remained so to Africans living in the American colonies. African funeral traditions lived on throughout the South. Many slaves believed that death returned them to their ancestral homelands in Africa, and funerals sometimes turned into celebrations, complete with long processions, music, and drinking alcohol. The dead sometimes were dressed in African clothing and beads and were occasionally buried under mounds of glass, potsherds, and seashells. This type of grave was used in the Carolina low country throughout the colonial period and beyond.

When African Americans did turn to Christianity on a large scale, during the era of the Great Awakening—roughly the 1730s and 1740s—they made it fit their worldview and coexist with the belief systems they already had in place. Christianity held few benefits for the first generations of African Americans, and most continued to rely on an amalgam of beliefs derived from their experiences in Africa and as part of the slave trade. These practices lived on, although Christianity played an increasingly important role as more Africans were born in America over the course of the eighteenth century.

African Americans also put their own spin on the evangelical movements of the Great Awakening. Slave preachers, recognizing the redemptive and revolutionary aspects of some parts of Christian teaching, exhorted their congregations tirelessly. African American Christianity relied on the great physical expressiveness of older forms in combination with new revelations brought by the Bible and other religious texts. Occasionally, members of the congregation would fall into trancelike states, perhaps reflective of ancient practices; similarly, African Americans relied on the ring shout and the choreographed call-and-response pattern during their church services.

Slaves were particularly enthusiastic about the implications of Christian baptism, which many believed would make them free in a literal sense, as this had been the case in some colonies in the early years of slavery. This interpretation ran against the view of the masters and could lead to violence.

Most African American Christians continued to mix African notions with Christian teachings throughout the colonial period. Some even applied a millennial reading to the Revolutionary events of the 1770s.

Religions, Native American

Native American religions have always been philosophically and socially complex, as well as intimately tied to the historical experiences of the communities that espouse them. For instance, many Native Americans would insist that their people had no “religion,” as the term is understood by nonnatives. Some would argue that native belief cannot be separated from the everyday experiences of individual Native Americans and their collective experience of ritual life.

Several crucial differences between Native American religions and European religions led early Europeans to misinterpret or disparage native beliefs. Native peoples conceived of sacred power in a spatial way: certain places were extraordinarily sacred, and the ways in which things were arrayed in space was fundamentally important. The beliefs of native communities were often tied to specific features of their surrounding landscape, and certain lakes and mountains took on special significance for those who lived near them. Time tended to be a more important concept to European religions, which also were readily transferable across space.

Secondly, native religions place great emphasis on communal ceremonial practice. Vine Deloria, a leading native scholar, has argued that Native Americans participate in ceremonies not for their own benefit, but for the good of the community as a whole. Consequently, individual transgressions could harm the spiritual well-being of the entire community.

Creation

Every native community has its own creation story and culture heroes, although there is considerable variance among these narratives. Iroquois-speaking peoples believed that the world was created on the back of a turtle. Other groups saw their origins in the sexual union of the sun and moon, or a first man and woman. In both the Southwest and Southeast, native peoples spoke of traveling on long journeys underground and emerging as human beings.

Stories of cultural heroes are just as varied. In one widely known example, Iroquois people told early Europeans of twin brothers, one of whom worked hard to make the world habitable and fertile, and the other who worked at cross purposes with the first. The world existed in tension between good and bad forces as a result of the brothers' eternal struggle.

Many native communities told tales to their youth as a way of imparting cultural values. For instance, trickster stories, featuring characters like Fox and Coyote, who could change form in order to trick humans and teach a lesson, gave native parents a way to teach their children some of life's lessons.

Architecture and Objects

Native American architecture reflected beliefs about society and religion. Two spectacular examples are the Aztec capital city of Tenochtitlán and the Mississippian mound complex at Cahokia. At each of these sites, native people constructed massive ceremonial centers reflective of their respective worldviews.

The Aztec understanding of the universe focused on a central place, their capital city. Fittingly, they built a huge stone pyramid topped by a temple. Warehouses, schools, and palaces ringed the sacred site, and from this position, the Aztecs reckoned their place in the world. The giant earthworks at Cahokia (near present-day East St. Louis, Illinois) were also set apart as the special domain of priests and chiefs.

Native art objects like pipes, masks, and flutes underscore the performative aspects of religious celebrations and rituals. These objects, by and large, were meant to be used, to be seen in motion, and to inform native peoples' understanding of themselves and their world. The physical appearance of a sacred object was considered inseparable from its function. Masks in particular, used throughout North America, were meant to be worn during religious

performances. Dance and music were important to native religious expression and remain so.

Rituals

The stages of Native American life were often delineated by religious rituals. Among many peoples, puberty rites marked the transition to adulthood. These rites differed according to the sex of the participants, but most taught young women the roles of wife and mother and taught men their culturally appropriate role.

In many cultures, isolation and fasting accompanied this process. Ojibwe boys, for instance, were led into the woods to fast and wait for a vision or dream. The dream received could serve as a lifelong spiritual guide.

Of course, vision quests were not only for young men. People throughout North America engaged in the practice to assuage grief or in an effort to obtain shamanic powers. Shamans practiced throughout North America, although their role varied from culture to culture. Some inherited their spiritual gifts, while others earned them. Often, Shamans advised tribal leaders.

Aspects of Native American religions and related worldviews appeared in many activities that at first glance do not seem particularly religious. Hunting, fishing, and agriculture gave many peoples a context in which to express their religious beliefs. In the Pacific Northwest, Kwakiutl belief stressed the interdependency of animals and human beings; hunters killed game animals during the summer, then during winter ceremonials paid homage in various dances and rituals, often disguised as game animals. Such beliefs and practices were not at all uncommon. Success in hunting or warfare could be an indication of spiritual blessing.

Seasonal cycles, crucial to effective agriculture, played an important role in many Native American religions. Corn was especially valued. The legend of the Cherokees' Selu, the Corn Woman, is the most famous example. Selu's children conspired to kill her. At her request, they dragged her bleeding body over the ground; wherever her blood fell, corn grew.

Arrival of Europeans and Change

In the era of European colonization and Christianization, Native American religions underwent significant changes. In certain areas, particularly New Spain and New France, European missionaries achieved remarkable success in converting native peoples to Catholicism.

Jesuits operating in Canada and Franciscans throughout the American Southwest and Southeast set up a number of populous missions. Franciscans were particularly adept at settling in the midst of large, sedentary native communities and integrating themselves—to the extent possible—into the everyday lives of the native peoples.

Of course, how much native parishioners chose to accept of the new faith was up to them. Generally, native communities incorporated the Christian God and saints into their indigenous religious practices, which they maintained as integral parts of their cultural life. Efforts by Europeans to force complete religious conformity was more likely to meet resistance and could lead to violence, as was the case in New Mexico's Pueblo Revolt of 1680.

The English were not as interested in converting North America's native populations to Christianity. Notable exceptions were the "praying towns" established by John Eliot in seventeenth-century Massachusetts.

Adapted religious forms also served as means by which the native peoples could confront European colonialism. In the 1760s, Neolin, a prophet among the Lenni Lenape (also known as the Delaware) exerted great influence among eastern Native Americans. Neolin used the tactics of evangelical Christianity to spread a pan-native, anti-white message. He believed that whites and Native Americans had been created as separate races of people and that white people had obstructed the indigenous peoples' access to heaven. To remedy the situation, he preached, native peoples should band together and reject the trappings of Euro-American life.

Neolin's teachings inspired the widespread anti-British campaign known as Pontiac's Rebellion. They also laid the groundwork for later revivalist movements, the most striking of which took hold among the Shawnee in the early nineteenth century and in Handsome Lake's religion in Iroquois country.

Revere, Paul (1735–1818)

Paul Revere, silversmith and Revolutionary patriot, was born in Boston in 1735 to a family of French Huguenots. When his father died in 1754, Revere inherited a thriving silversmith's shop. After a brief tour of duty as lieutenant in the French and Indian War, Revere returned to business. In 1757, he married Sarah Orne ("Sary"), with whom he had eight children.

Over the next decade, Revere diversified his business to encompass surgical instruments, copper engravings, music sheets, carved picture frames, and even dentistry items. But it was his work in silver that remained the core of his business. By the eve of the Revolution, he was the most respected silversmith in New England, producing everything from shoe buckles to commemorative tankards for customers of all social ranks.

During the 1760s, as the local economy slackened and tensions with Britain grew, Revere became increasingly active in political affairs. He joined several working-class Whig political organizations, including the North Caucus Club and the more exclusive Long Room Club. In 1765, he became one of the first members of the Sons of Liberty, a fraternity that led local opposition to the Stamp Act.

In 1770, Revere put his engraving skills to work for the Whig cause, publishing a controversial engraving condemning the Boston Massacre. This incendiary piece distorts the actual, complex events of that March night into a picture of a cruel, calculated slaughter. Three years later, in May 1773, his wife Sarah died; Revere remarried, wedding Rachel Walker, who bore him eight more children.

By this time, Revere had become the de facto leader of the town's artisan class and thus was instrumental in the planning and execution of the Tea Party in Boston harbor in December 1773. For the next two years, he served as an express rider for the Committee of Safety in Boston, an anti-British organization. In its service, he made more than a dozen rides to New York, Philadelphia, and towns north of Boston, delivering news of the Suffolk Resolves, the Boston Port bill, and other developments to pockets of Whig resistance.

It was his ride from Charlestown to Lexington on April 18, 1775, that won him a place in the national memory. Immortalized and falsified in Longfellow's nineteenth-century poem, Revere's "midnight ride" was part of a coordinated attempt to warn John Hancock and Samuel Adams that the British, currently occupying Boston, were headed toward patriot bases in Lexington and Concord. Revere's warning gave patriot leaders just enough time to spread the alarm throughout the countryside, initiating the rapid formation of militias in many towns.

Refused a position in the Continentals, Revere spent several years as a major in the Massachusetts army. He helped defend Boston harbor, escorted prisoner-of-war transports, and participated in an operation to liberate Newport, Rhode Island, from British occupation.

Paul Revere—patriot, fabled nightrider, and master silversmith—lived to the age of 83. After the war, he designed and printed the first Continental

currency, manufactured cannons, and pioneered the production of copper plating. (Library of Congress/Bridgeman Art Library)

In one disastrous campaign in 1779, Revere tried to engage the British in Penobscot Bay, Maine—a maneuver that led to the worst patriot naval defeat of the war. Revere was unjustly court-martialed and subsequently acquitted, though not before being forced to leave the service.

Revere's business interests continued to expand after the war as he searched for new outlets for his talents. He opened a hardware store, became involved in the manufacture of gunpowder, and secured the contract for the production and engraving of the first Continental currency and the official seal of the colonies. In 1789, he established a foundry to manufacture bells and cannons; by 1794, he had secured lucrative defense contracts to provide howitzers, mortars, and naval artillery. In 1800, he invented a new way of rolling sheet copper and was soon supplying copper to cover the dome of the rising statehouse, the cornerstone of which he had laid in 1795.

Now in his 60s, Revere was a prominent civic leader. He was elected as first president of the Massachusetts Charitable Mechanic Association and of Boston's first board of health. He also served as a Suffolk County coroner for six years and was a member of several philanthropic committees.

In his later years, he increasingly traded on his wartime feats. Because of his patriotic deeds and more recent success with his iron foundry, he took to calling himself “the Old Founder” and reportedly wore uniforms of the Revolution every day until his death in 1818 at the age of 83.

For decades, Revere had successfully spanned the political chasm that threatened to separate artisans from the elites. He may be most usefully remembered not as a leader but as a communicator and an organizer, without whom the Revolution might often have faltered.

Revolutionary War

The American Revolution began as a series of protests against British mercantile policies, which evolved over time into the broader, violent War for Independence (1775–1783) fought for civil and religious rights. Early protests (1763–1773) were not aimed at establishing national independence; rather, they were intended to pressure the Crown and Parliament into granting colonists specific political and economic concessions.

Until late 1775, many colonists upheld conciliation as a laudable, attainable goal, and considered political independence a radical and doomed proposition. After the outbreak of armed violence in Massachusetts in April 1775, however, colonial protests changed quickly into social revolution. Drawing on deep-rooted ideas about moral government, the rights of the governed, and the obligations of rulers, common people appropriated much elite rhetoric to further their own political ends.

By the war's end, many men and women—free as well as enslaved—clamored for an end to traditional social and class privileges, attempting to turn the Revolution's abstract ideals of rights and liberties into actual political practice. While the war did preserve rights long enjoyed by white male colonists—freedom of religion, local representation, and the right to own property—it did not expand them wholesale to new groups. Women, blacks, and Native Americans enjoyed few liberating changes, and the achievement of national independence preserved many legal racial and gender inequalities.

Pre-War Colonial Developments

When viewed in 1760—the year a young, inexperienced, and politically naive George III became king of Great Britain—a united colonial rebellion appeared almost unthinkable. For starters, the North American colonies seemed more divided than united.

As late as 1775, many colonists would have agreed with Connecticut minister Robert Ross's claim that “it was doubtless expected, from Colonies so different in climate, trade, and *religion*, that they would never agree, but contend and jar, and so break into pieces among themselves.” For example, orthodox New England Calvinists were deeply suspicious of more religiously tolerant Rhode Island; Connecticut engaged in a heated dispute with

Pennsylvania over control of Wyoming Valley lands; and civil war broke out between western and eastern North Carolina in 1771.

The social and cultural commonalities that did exist between colonies seemed to bind them close to the British Crown. Free colonists were mainly of English descent and proudly asserted their English identity and the inherited rights that they believed such a heritage guaranteed. American colonists also relished all things British and fashioned themselves as English cosmopolitans, greedily purchasing the latest British consumer goods. Colonists were also overwhelmingly Protestant and thus shared with their transatlantic English counterparts the assumption that they belonged to a specially blessed, elect nation. American colonists understood that they were subjects of the most powerful, largest empire in the history of the Western world, and such an identity conferred upon them a large measure of national pride.

The benefit of historic hindsight, however, unearths developments that point if not to the inevitability of the Revolution at least to ways of understanding how it came about. Most colonists worked as farmers and many owned their land, which granted white male colonists a measure of economic and political independence unknown in England. Whereas only a very small minority of Britons could vote, fairly widespread colonial property ownership meant that a large percentage of America's white male population enjoyed suffrage. Thus, many male colonists had a hand in determining the makeup of the representative local assemblies that made laws and levied taxes. As a result, white male colonists held different assumptions about local government and enjoyed a more direct relationship to it than did their contemporaries across the Atlantic.

Prior to 1763, the political meaning of membership in the British Empire remained largely symbolic in the colonies. Most colonists could go for years without encountering an imperial officer. In addition, appointed royal governors held very little ruling power, as they were often beholden to the will of the colonial legislature. And while the king held the right to veto any colonial law, he rarely, if ever, did so. Local governments maintained control over taxation, and weak, often very inefficient imperial officers enforced the few customs duties and trade regulations that governed colonial economic life.

This loose imperial administrative system led to very different assumptions about the nature of the relationship between Crown, Parliament, and the American colonies. Colonists praised the loose structure of imperial rule, identifying parliamentary supremacy over the king with the ascendancy of colonial assemblies over royal governors. Over time, colonists developed the idea that all Britons had the right to representative government and that they were more beholden to local representatives—whom they elected—than they were to Parliament, in which they had no direct vote. Parliament and king disagreed, however; custom, they argued, and not constitution, informed such erroneous colonial assumptions.

In reality, Parliament did maintain ultimate authority over all British subjects—and this meant the authority to tax—even if it did not always choose to exercise its powers. Through the revenue and billeting acts of the 1760s and early 1770s, Parliament asserted the British belief in its sovereignty over all subjects.

Early Protests, 1763–1770

Breaking from the pattern set by earlier Hanoverian kings, who had governed the North American colonies loosely and without a large imperial presence, the new King George III aimed to play an active role in government administration. His political miscalculations toward the colonies began almost immediately. Victory in the Seven Years' War (1756–1763) had left Britain deeply in debt and in need of massive funds to support the 7,000 regular soldiers now stationed in America. With George III's support, Britain's Chancellor of the Exchequer George Grenville decided that American subjects should be taxed to support this large—and by most Americans unwanted—military presence.

Both the decision to maintain a permanent military force in the colonies and to directly tax colonists in order to pay for their own defense were key in setting off the string of events that would eventually culminate in American independence. While colonists accepted the right of representative assemblies in local governments to assess taxes, they did not believe that Parliament enjoyed the same authority. By taxing them without American representation and against Americans' wishes, colonists believed that Parliament wielded an arbitrary and potentially abusive authority.

The presence of thousands of redcoats in their cities and along western borders seemed to support their suspicions. Rather than see a standing army as guarding their liberties—or protecting them against foreign foes, as Parliament claimed—colonists feared that the occupying army aimed to force them and their assemblies into tame submission.

Such fears were born of experience. Britain had always left colonial defense up to the colonists themselves. Furthermore, the one war in which large numbers of British troops had been sent to defend colonists—the Seven Years' War, or French and Indian War, as it was known in the colonies—had resulted in the expulsion of France from Canada. The events of recent past, then, contradicted parliamentary assertions. Colonists were convinced that such acts endangered their collective rights and liberties, and they argued this first through petitions and later through boycotts, street demonstrations, and armed rebellion.

Initial colonial protests targeted specific Acts of Parliament, however, and in no way urged revolution. The Sugar Act (1764), the first revenue act passed by Parliament, targeted imports and toughened custom methods. Mainly because it threatened colonial merchants' profits, the act initiated a flurry of petitions by the colonial gentry but no mass movement.

The Stamp Act (1765) targeted items such as playing cards and marriage licenses—likely to be used by nonelite Americans—and thereby widened the scope of protest to include ordinary people. Large numbers pledged to boycott British goods and support instead local manufactures. Extralegal groups such as the Sons of Liberty organized to enforce such pledges. Resistance soon moved into the streets, where people paraded, burned effigies, and attacked Customs houses.

Faced with large-scale popular protests, members of Parliament repealed the act. Before long, however, they tried again, this time passing the equally unpopular Townshend Acts (1767). The heat of resulting protests led the British government to dissolve multiple colonial legislatures—in the eyes of many colonists, the very basis of their political liberty.

In 1770, the physical threat suggested by British soldiers became reality when confused troops opened fire on jeering Boston crowds, initiating what became known as the Boston Massacre. Small though it was in the annals of massacres—it left five Americans dead—its effects were huge. The killings inflamed the pens of talented colonial propagandists, who, in turn, provoked intense popular reactions throughout the colonies by publishing a steady

stream of partisan sermons, pamphlets, and newspapers.

By taking to the streets in response to British policies and atrocities, ordinary colonials exercised the traditional plebeian belief that each man had the right to life and property, defined as the fruits of his own labor. Following the notions of John Locke, they believed that in return for political loyalty, government had a moral responsibility to provide for the safety, liberty, and well-being of all its subjects. High taxes, they feared, might reduce subjects to the status of debtors, resulting in the loss of their land, and land was the foundation of colonial personal and political independence.

Worse, they feared that Parliament consciously meant to reduce them to slavery. To a slaveholding society, such fears were a powerful motivator. Blacks, both free and unfree, experienced daily the harsh reality that their labor could be stolen; their lot reminded whites of the inhumane realities of bondage. Some colonists also viewed their political troubles with England as God's judgment on them for owning slaves. Many common people, black as well as white, combined a political rhetoric concerned with liberty and property with religious language informed by Christian egalitarianism to propel their own movements for egalitarian civil rights.

Moving Toward War, 1770–1775

Political events and popular sentiment soon culminated in armed resistance and revolution. Samuel Adams, a radical Bostonian, initiated a committee of correspondence (1772)—first between separate Massachusetts towns, later between separate colonies—to keep Americans abreast of British Crown encroachments on their liberty. Passage of the tough, retaliatory Coercive Acts (1774) convinced colonists that their worst fears were being realized: George III and his ministers aimed to reduce the colonies to absolute political dependence. The Quebec Act (1774) angered ordinary men and women more than any other, convincing many Protestants that Parliament aimed to take away their traditional religious liberties.

Revolutionary War, 1775–1781. *The Revolutionary War was a wide-ranging conflict that stretched from Lower Canada to Georgia. While the British won most of the battles in the South, their losses in the North and their inability to destroy rebel forces led to an admission of defeat after the Battle of Yorktown in October 1781.* (Carto-Graphics)

Local protests, through print, correspondence, and cross-colony organizing, became joined in a colonies-wide resistance movement. Local committees of correspondence organized the first Continental Congress (1774), which not only agreed to halt commerce with Britain but, more importantly, became the first legitimate representative body of all the colonies. Although only the most radical members publicly advocated complete independence, many were slowly coming to believe that armed rebellion was imminent.

The War for Independence, 1775–1783

On April 19, 1775, armed rebellion broke out in Concord and Lexington, Massachusetts, between British soldiers and untrained American militias. In May 1775, the second Continental Congress met to assess the dire situation: America was fighting perhaps the strongest European force; political and religious differences still split colonists; and America lacked an army, leadership, and a central government. Despite these looming problems, Congress authorized the formation of the Continental army and placed George Washington at its head.

The Revolutionary movement gained considerable momentum with the January 1776 publication of Thomas Paine's radical pamphlet *Common Sense*. Paine raised the democratic hopes of many common colonists by urging them to break with tradition, criticize their beloved British constitution, and view their rebellion as a deeply moral struggle for national independence. Enjoying more popular authority than either the Continental army or Congress, Paine tapped the democratic aspirations of the many. After much debate, Congress finally voted for independence on July 2, 1776.

Initially, British military victory seemed assured. They had a regular army, the ability to raise revenue, experienced officers, and the support of thousands of American loyalists and Native Americans. The British also tried to win the loyalty of enslaved blacks, promising them freedom in return for military service. Some joined the British, but many blacks recognized that the British government had condoned their enslavement in the first place. They instead embraced the opportunity provided by wartime disruptions and fled to freedom in Canada.

British attempts to enlist slaves also enraged many white colonists, turning formerly lukewarm patriots into Revolutionaries. The challenges of transporting troops and supplies across the Atlantic, the need to occupy a vast territory, and the depth of popular commitment to the Revolution further tipped the scales closer to American victory and ensured a long, hard military struggle.

Recruiting American soldiers the first year was easy; mobilizing men became progressively harder as supplies, pay, food, and patience grew increasingly scarce. While Continental troops performed well at Bunker Hill in 1775, by the fall of 1776, hopes for American victory had grown dim. New York City remained under British control, and attempts to invade British-controlled Canada had failed miserably.

In the summer of 1777, American troops won a stunning victory at Saratoga, where the British surrendered over 5,800 troops to American forces. As a result, France allied herself with the Americans, providing desperately needed monetary and military support.

After 1779, the war moved southward into its most violent phase, appearing more as a bloody guerilla war and less as a moral struggle for rights. By 1780, the situation had grown so dire that a string of troop mutinies occurred, and a lack of new recruits gave leaders cause to worry. Finally, in 1781, a decisive American and French victory at Yorktown secured the surrender of General Cornwallis and 6,000 British troops. Formal peace was achieved diplomatically in 1783.

Revolution's Domestic Legacy

While liberating for common white men, the Revolution had mixed results for other Americans. Nonelite white men entered local politics in increasing numbers, property ownership increased as frontier lands opened up for white settlement, and aristocratic pretenses were attacked openly.

The Revolution also nationalized radical political movements that had once been localized. These political and social benefits, however, were distributed unevenly. A postwar economic depression forced many poor soldiers to sell their land bounties, earned through military service, to predatory speculators.

In the Siege of Yorktown, the last major confrontation of the Revolutionary War, American and French forces surrounded 6,000 British troops led by General Charles Cornwallis on the Virginia peninsula and forced their surrender on October 19, 1781. (Chateau de Versailles, France/Lauros/Giraudon/Bridgeman Art Library)

Women, blacks, and Native Americans also failed to reap the benefits of a supposedly democratic revolution. While small numbers of middle-class women saw an expansion of educational opportunities, the lives of the majority were still bounded by home and marriage. Women could not own property; they lacked important legal rights and in marriage became completely dependent on their husbands. Male independence was, in many ways, defined by the

dependence of the individual's family.

Blacks fared even less well. Although emancipations increased after the Revolution and some blacks gained freedom by fleeing to Canada or joining the British forces, slavery was retained under the Constitution and strengthened in the years following independence. And while some treaties and accommodations were made with Native Americans, the new American nation often violently and unfairly removed the native peoples from their lands.

Rhode Island

In the late sixteenth century, Rhode Island was home to five Native American tribes: the Narragansett, the Wampanoag, the Niantic, the Pequot, and the Nipmuc. Of these tribes, only the Narragansett had lands solely within the modern borders of Rhode Island, stretching along the edges of Narragansett Bay. The Wampanoag lived in Massachusetts and eastern Rhode Island, the Niantic and Pequot tribes in Connecticut and southwestern Rhode Island, and the Nipmuc in Massachusetts and northern Rhode Island. All of these tribes were members of a larger Algonquin confederation and spoke languages similar to the other Algonquin tribes.

Prior to European contact, the total Native American population in Rhode Island was approximately 10,000 people. Following exposure to European diseases in 1616 and 1617, the total Native American population fell to approximately 4,000.

First European Encounters

The first known European exploration of Rhode Island was a voyage made in 1524 by Giovanni da Verrazano, an Italian explorer. In 1614, the Dutch explorer Adriaen Block met with the Narragansett tribe. Both men may have contributed to the colony's English name. Verrazano described the shape of an island in Narragansett Bay as being similar to the shape of the island of Rhodes in Greece. Block noticed red clay on islands in the bay and called them *Roodt Eylandt*, meaning "Red Island" in Dutch.

In the early 1630s, an English minister named William Blackstone moved to North America. Seeking solitude, he started a farm near modern-day Boston. On hearing about the Puritans' search for land, he invited John Winthrop and his followers to settle near him. Soon afterwards, Blackstone decided to move farther south in search of more permanent solitude. In 1634, he established a farm called "Study Hill" in northeastern Rhode Island. Blackstone occasionally preached to his neighbors, but he never formed an organized congregation. He continued to live on his farm until his death in 1675.

Although Blackstone was the first English settler in Rhode Island, the colony was not firmly established until the arrival of Roger Williams in 1636. Like Blackstone, Williams was a minister from the Massachusetts Bay Colony. Unlike Blackstone, Williams actively sought leadership of his own religious congregation. In late fall of 1635, he was exiled by the leaders of Massachusetts Bay for his "dangerous opinions" on religion, political rule, and English treatment of Native Americans.

Following his exile, Williams spent the winter with a Wampanoag community on the eastern side of Narragansett Bay. In the spring, he purchased land on the Seekonk River from the Wampanoag. Governor Edward Winslow of Plymouth Colony informed him that he was living on Plymouth land and suggested that he move farther west. In June of 1636, Williams purchased land from the Narragansett on the other side of the Seekonk River. Shortly afterward, he was joined by his wife, children, and some of his followers. They founded a town they called Providence and drew up a fellowship to determine laws of governing.

Other towns began to be founded in Rhode Island, all of them by religious dissidents from the Massachusetts Bay Colony. Anne Hutchinson, William Coddington, and John Clarke founded Portsmouth on the north end of Aquidneck Island in 1638. Coddington, Clarke, and their followers then broke away from Portsmouth to found Newport in 1639. Following several years of wrangling with the Massachusetts Bay Colony, the Plymouth Colony, and the existing Rhode Island towns, Samuel Gorton founded Warwick in 1643. Although Hutchinson, Coddington, and Clarke had spoken with Roger Williams about obtaining land from the Narragansett tribe, the four towns existed as separate entities rather than a unified colony, making them vulnerable to control from Massachusetts Bay.

Like other settlements in Rhode Island, Newport was founded (in 1639) by religious dissidents from the Massachusetts Bay Colony. By 1730, as seen here, the town flourished in shipping and the Triangle Trade. (Brown Brothers, Sterling, Pennsylvania)

In 1644, England was ruled by a Puritan-dominated Parliament, rather than the Crown. Encouraged by this, Providence, Portsmouth, and Newport agreed to send Williams to England to obtain official recognition. A patent was granted, and the Rhode Island towns were united. The patent defined Rhode Island's boundaries and extended religious freedom to all of its people. The first General Assembly of the colony met in 1647, and official laws were drawn up.

As Rhode Island's religious freedoms became better known, the colony became a refuge for members of other religions. In 1656, a community of Jews settled in Newport. They were followed in 1657 by Quakers fleeing persecution in Boston.

By 1660, England was again under Crown rule. Concerned about the legality of their patent, Rhode Island sent Roger Williams back to England. In 1663, Charles II granted an official charter to the "Colony of Rhode Island and Providence Plantations." Like the patent, the charter granted religious freedoms, as well as a great deal of self-rule.

King Philip's War began in 1675 between the Wampanoag and their English neighbors in southeastern Massachusetts. Although Rhode Island had always had good relations with their Wampanoag and Narragansett neighbors, the colony was drawn into the war. A major battle took place at a Narragansett village in the Great Swamp in northeastern Rhode Island. An army of British colonists led by Governor Josiah Winslow of Plymouth Colony and Captain Benjamin Church from Rhode Island destroyed the village late in 1675. In March of 1676, the Narragansett began preparing to attack Providence. Roger Williams met with Canonchet, the Narragansett chief, in the hope of a diplomatic intervention. He was unsuccessful, and Providence was nearly destroyed.

In July of 1676, a troop of men led by Benjamin Church attacked the Native American leader King Philip (also known as Metacom) near his home at Mount Hope, Rhode Island. King Philip was killed, along with hundreds of his tribe. Following this event, the war ended in southern New England, although it continued for another two years in Maine and New Hampshire.

Despite granting royal charters to Connecticut in 1662 and Rhode Island in 1663, the British Crown remained concerned about controlling the Puritan colonies of New England. In 1684, King James II revoked Massachusetts Bay Colony's charter. Shortly afterwards, he created the Dominion of New England. Consisting of Massachusetts Bay, Plymouth, New Hampshire, and Maine, the Dominion was governed by Sir Edmund Andros.

Connecticut and Rhode Island both hoped to remain independent but were annexed to the Dominion in 1687. Like Connecticut, Rhode Island was able to hide its charter. Following the Glorious Revolution in England, Massachusetts revolted, and Governor Andros was imprisoned. Shortly afterward, Rhode

Island began reasserting its independence, arguing that its charter was still valid, because it had never been revoked. In 1690, the colony regained recognition by the British Crown.

Coming of the Revolution

The earliest signs of the American Revolution in Rhode Island were protests in 1765 against the Stamp Act, followed by more protests against the Townshend duties in 1767. In 1772, the British war ship *Gaspee* was assigned to patrol Narragansett Bay for smugglers avoiding the duties. When Rhode Islanders protested, the British threatened to hang anyone who resisted being searched. Captain Benjamin Lindsey organized a group of men who burned the *Gaspee* to the waterline. Shortly after the Revolutionary War officially began with the Battle of Lexington and Concord in 1775, Rhode Island sent troops under the command of Nathaniel Greene to Massachusetts.

The colonies began plans for a separate country with the 1774 convening of the Continental Congress in Philadelphia. Rhode Island sent two representatives, Stephen Hopkins and Samuel Ward. The two were also sent in June of 1775, when the Continental Congress met for a second time. Following the creation of the Continental army, Hopkins argued for the creation of a navy as well. The Continental navy was organized in December 1775 under the command of Esek Hopkins, Stephen Hopkins's younger brother. On May 4, 1776, Rhode Island became the first colony to declare itself fully independent of Britain. The other colonies quickly followed.

In December 1776, the war arrived in Rhode Island when Sir Henry Clinton captured Newport. Two years later, the British still controlled the city. When the French joined the Americans in 1778, they planned to retake Newport. An American force under General John Sullivan would attack the British from the east; a French fleet under Count d'Estaing would attack from the west. Before they were able to begin the attack, a British fleet under the command of Admiral Richard Howe appeared in Narragansett Bay. The French sailed away, and a storm damaged both the American and English fleets. D'Estaing returned to Boston, leaving Sullivan alone to face the British. On August 29, 1778, Sullivan unsuccessfully fought a large group of British soldiers in the Battle of Rhode Island. Shortly afterward, he retreated, leaving the British still in command of Newport. Eventually, the British left Newport of their own accord in October 1779.

Although the remainder of the war was fought south of Rhode Island, the colony continued to support the colonial cause with troops, money, and supplies. Following the end of the Revolution in 1781, Rhode Island resisted becoming part of the United States, as it feared it would be powerless against larger states. In 1787, Rhode Island was the only state not to send delegates to the Constitutional Convention.

Rhode Island eventually agreed to ratify the Constitution and became the thirteenth state in 1790. It was ruled under the terms of its 1663 charter until a state constitution was written in 1843.

Rice

English planters began cultivating rice along the southeastern coast of colonial North America in the early seventeenth century. Evidence suggests that settlers attempted to grow rice in Virginia as early as 1609 and that, by the early eighteenth century, Englishmen, mostly from Virginia, were growing rice in North Carolina as well. Early English settlers grew rice primarily for their own consumption, not export, especially in Virginia, where tobacco cultivation dominated the economy.

By the 1690s, rice cultivation had spread to South Carolina, where African slaves primarily from the Upper Guinea Coast played a critical role in the production of rice as a cash crop intended for export. Africans brought an intimate knowledge of the production of many types of rice with them to the New World and often helped their English overseers and masters, who did not have as much experience growing rice, create and maintain expansive rice plantations.

African slaves introduced many sophisticated soil- and water-management techniques to coastal South Carolina that made large-scale rice production possible. The hollow cypress logs—known as “trunks” or “plugs”—that planters used to control the flow of water through embankments were an African innovation. Africans also most likely brought the red-colored rice found in early South Carolina. By no means was every slave in South Carolina brought from the rice fields of West Africa. There were, however, hundreds who were. As the eighteenth century progressed, thousands of slaves in South Carolina

became much more familiar with the planting, hoeing, processing, and cooking of rice than their English owners.

Each year, slaves repeated an intense planting, growing, and harvesting process that was critical to the production of rice. In the spring, slaves harrowed and plowed the land in preparation for planting. Then, during the first week of April, they sowed the rice seed by hand, using a small hoe. Slaves then flooded the field, barely covering the seeds (sprout flow). When the grain sprouted, slaves drained the field and allowed the rice to grow for approximately three weeks.

During the first week of May, slaves removed any grass growing among the sprouts with a hoe and flooded the field again (point flow). After a few days, they slowly drained the field, exposing the top half of each plant. The water was left at this level until the plant was able to stand on its own (long flow). Slaves then drained the field completely and removed any weeds. Again, after approximately three weeks, usually by end of June or the beginning of July, they flooded the field once again, gradually adding more water until the plants were completely submerged (lay-by flow). They then kept the field flooded for the next two months.

Rice planted during the first week of April was usually ready to be harvested by the first week of September. In September, slaves drained the field and cut the rice with large sickles called rice hooks. They then laid the rice on the ground and allowed it to dry overnight. The next day the rice was shipped by flatboat to the threshing yard.

During the colonial period, threshing was most often done by beating the rice stalks with flails. Slaves also used the mortar-and-pestle technique, which they brought with them from Africa, to remove rice grains from their husks. Several slaves, usually women, cleaned the grain a little bit at a time by placing it in a wooden mortar and beating it with a wooden pestle. In October, slaves “fanned” the threshed grain in wide, flat winnowing baskets made from an African design.

Rice production increased dramatically in South Carolina after 1705 and was critical to the colony's development. Plantation owners exported large quantities of rice throughout the world. By 1739, South Carolina had exported 764,280 barrels or 143,986 tons of rice. From the 1750s through the late nineteenth century, South Carolina remained America's leading rice producer.

The production of rice in South Carolina would not have been possible without African slaves. They provided the knowledge and experience as well as the labor necessary for large-scale rice cultivation. The importance of slaves to rice production led to a rapid rise in South Carolina's slave population. By 1740, approximately 40,000 Africans were living in South Carolina, versus approximately 20,000 whites. Although the production of cotton eventually eclipsed the production of rice in South Carolina, the culture that emerged on the coastal rice plantations made a lasting impression on South Carolina's landscape, economy, and society.

Rights of the British Colonies Asserted and Proved, The (1764)

Written by the famous Massachusetts lawyer James Otis, Jr., *The Rights of the British Colonies Asserted and Proved* was a direct response to the Stamp Act, passed by the British Parliament earlier in the year. The central theme of this document is the necessity of colonial representation in Parliament, especially if Parliament desired to tax the colonies. A corollary to Otis's arguments was that American colonists had the same rights as Englishmen.

Otis opened his treatise with a brief history of Anglo-Saxon liberties, a common theme in pre-Revolutionary War documents. A discussion on the English Bill of Rights follows, where Otis claimed that, since the ascension of William and Mary to the English throne, the colonies had constantly praised the English Constitution. He also stated that the colonies had repeatedly demonstrated their loyalty to the Crown in wars and in their “affection and reverence” for their mother country. Thus, because of these displays, the colonists had more than demonstrated their loyalty and Englishness; therefore they possessed the same rights as all English subjects.

Otis argued that the colonists' rights derived from more than just acts of loyalty and fealty. The rights he believed the colonists possessed came from the same sources as English liberties—namely, natural law, common law, and acts of Parliament. As a result of sharing these rights, “Every British subject born on the continent of American, or in any other of the British dominions,” possesses “all the natural, essential, inherent and inseparable rights of our

fellow subjects in Great Britain.” Furthermore, Otis argued that after the 1688 settlement, no one held that these rights were confined only to the English isle. After stating his argument in these stark terms, Otis then listed six fundamental rights of all Englishmen that specifically related to the Stamp Act controversy. All six of these rights concerned the limits or boundaries of the authority and power of a legislative body, in this case Parliament. Of these six, the second enumeration, the unalterable form of the supreme national legislature and the permanence of a subordinate legislature, Otis went into some detail. It is in this section that Otis first lays out his belief that the colonists, as Englishmen, had the right to be represented in Parliament. Just because the colonies had subordinate legislatures did not mean that they could not be so represented. And by being represented, their taxation would be more lawful and acceptable. Thus, Parliament might actually have the authority to tax the colonies, provided that the colonies were not deprived of representation.

Along with his reliance on English history and law, Otis depended heavily on the sanctity of property to buffer his argument. He argued that liberty could not exist when property could be taken, through taxation, without some form of consent. Taxing the colonies without any form of representation meant depriving them “of one of their most essential rights, as freemen,” and, if it continued unabated, it would lead to the deprivation of all civil rights and slavery.

Otis also made a distinction between prohibitions of trade and taxation. Although liberty could still be enjoyed with prohibitions on trade, it could not survive under taxation without representation. Otis argued that once this “barrier of liberty” was destroyed, it would never be restored. In Otis’s estimation, the loss of other liberties was also occurring. The common law guarantee of a jury trial had succumbed in cases concerning the admiralty, hence, a colonist’s “peculiar privilege of an Englishman” and his property was left to the fate of one person.

Otis also defended the colonists’ rights to have legislatures. He refuted charges that to have subordinate legislatures was treasonous and calculated only as a way of gaining independence from Great Britain. No colonists, claimed Otis, had made that claim; in fact, the colonials were so well versed in the English Constitution that they understood that their local governments were secondary to Parliament and would therefore never want any other government. Furthermore, the existence of colonial legislatures would actually help Parliament to remain informed of the general needs of the colonials while at the same time allowing the colonies to administer to their local needs and concerns.

Otis’s *Rights of the British Colonies Asserted and Proved* relied on that famous theme of the Revolution, “No taxation without representation.” His essay went through several quick editions in both England and the colonies. So popular and convincing was its argument that the Massachusetts legislature endorsed it, as did radicals in England. Although Otis may be better known for his attack on the Writs of Assistance, his *Rights of the British Colonies Asserted and Proved* ranks as one of the most important pre-Revolutionary War documents.

Riots

Throughout the history of British North America, riots and uprisings played a role not only in the attempt to re-create Europe in America but also in the creation of a new social, economic, and political system. As Europeans traveled to British North America, they attempted to re-create what they had known in Europe in the New World. The European settlers thus brought with them specific social, economic, political, and cultural ideas that were adapted to their new environment and shaped their lives.

Throughout British North America, from 1607 to independence, there were both small and large riots that occurred for a variety of reasons. Many riots were local responses to changing circumstances, as colonists attempted to maintain traditional securities and a stable life. In others, people sought to overturn existing political systems or, in the case of slaves, to gain their freedom.

While riots were a common feature of colonial society, none created great change. Nevertheless, all provide insight into the changing local, regional, and imperial situations.

Seventeenth-Century Rioting

During the seventeenth century, as the colonies developed and expanded, there were two major riots that marked transitions in the development of

Virginia and New York. These were the two most important politically based uprisings until those of the American Revolution.

The first was Bacon's Rebellion, which occurred in Virginia in 1676. By the 1670s, Virginia suffered from a growing population of economically depressed individuals—former indentured servants—as well as declining tobacco prices and increasing taxes. These factors combined created social instability. In 1675, a squabble occurred between Virginian freemen and the Susquehannock Indians. Governor William Berkeley reacted to the situation by proposing the construction of a series of frontier forts, but those living on the frontier were unhappy with this plan. At this point, Nathaniel Bacon took command of a frontier militia preparing to attack all the local tribes.

For the most part, Bacon's militia was driven by the desire for more land. This group soon found itself in conflict with the coastal Tidewater elite, led by Berkeley, resulting in the militia's march on, and burning of, Jamestown. Before this social and political struggle could intensify, Bacon died, and the rebellion came to an end.

Berkeley soon regained control of Virginia and in the process executed twenty-three men before he was recalled to England. The rebellion did lead to the creation of a new series of treaties with the native peoples in the area, in turn opening more land to white settlement. After the rebellion, there was a distinct transition from the use of indentured servants to the utilization of slave labor.

The second of these riots was Leisler's Rebellion, which occurred in the context of England's Glorious Revolution in 1688. The seeds of the rebellion were planted in 1664, when the English captured New Amsterdam and turned it into New York while allowing the already established Dutch inhabitants to remain. When news reached the colonies of the removal of James II and his replacement by William and Mary, most of the colonies accepted the change. In New York, Jacob Leisler captured the government and became governor in the name of the new king and queen.

In 1691, the king finally appointed a new governor for New York, but Leisler refused to give up power. He was charged with treason and executed, along with his son. This seizure of power by Leisler, to the detriment of the old elite, caused a division in New York politics between the Leisler and anti-Leisler factions, creating problems for years to come.

What can be seen in both of these uprisings are attempts on the part of emerging factions to gain some type of political power. Riots with political motives would move into the background for most of the eighteenth century, only to re-emerge in the 1760s.

Moral Economy and Rioting

The most common form of rioting in British North America evolved out of what historians have termed “the traditional moral economy.” In England and other parts of Europe, the traditional social structure created contractual obligations between the various groups. While the lower class accepted the power of the upper, the upper reciprocated by working to ensure the stability of the lower. This meant that in times of crisis—be it famine, plague or war—the two classes were interdependent and supported one another.

Thus, in times of famine, the upper class set the price of food to a level that ensured the survival of the poor. The vast majority of riots that occurred in the colonies did so in the context of this moral economy, as the local population reacted to any adverse changes. As the colonies were brought into the larger market economy of the Atlantic world, these riots became common, bringing about changes that challenged the stability of the colonists' lives. Shortages of food also led to food riots, sometimes called bread riots, which occurred in both Europe and British North America. The interdependence of the rich and the poor, however, led to the concept of a “just price” that would ensure the survival of all.

As a market economy developed and as British North America became increasingly tied to it, the idea of a just price came under challenge. In the 1770s, as the American crisis led to war, food riots became very common as the military demanded food, and merchants, seeing an opportunity to profit from this, raised their prices. The underlying purpose of most food riots was to show that the people were unhappy and that local officials needed to intervene.

Food riots are interesting in that both sides understood their roles and responsibilities and because the majority of the participants were women, the ones primarily responsible for feeding their families. While women were still relegated to a traditional domestic role, and where the idea of coverture, or the subsuming of a woman's legal identity in that of her husband's upon marriage, gave their husbands total power over them, women still developed a way of becoming active and gaining an indirect political voice.

Along with food riots, numerous other riots occurred throughout British North America. In 1763 and 1764, as the French and Indian War came to a close, regular soldiers rose in rebellion over changes in how they would be paid for their services. In an attempt to save money, the British army made many changes that negatively affected the rank and file. Like the participants in the bread riots, the soldiers resisted, because they saw that these changes would make their situation worse.

Another important form of rioting concerned the urban reactions to the press gangs of the Royal Navy. The Royal Navy possessed the tradition and right to impress sailors into service but, as most sailors knew the horrors of service in the Royal Navy, they actively and at times violently resisted the numerous press gangs.

While the European colonists rose up in reaction to situations that negatively affected them, another group that rioted to improve their position within colonial society were African slaves. They were in the worst position in that they lacked freedom and were relegated to lifetimes of toil. In response to their condition, slaves developed numerous ways to resist the institution of slavery. Rioting, or rebellion, was the most visible means of resistance. Because of the threat of punishment, it was the least chosen means of resistance. The most famous examples of slave uprisings in British North America included the slave revolts of 1712 and 1741 in New York City and the Stono Rebellion of 1739, along with numerous smaller riots.

All examples of rioting in British North America centered on the desire of various groups, reacting to what they saw as detrimental changes, to protect or improve their place in colonial society.

Roanoke Colony

In late July 1587, Governor John White and his party of eighty-nine men, seventeen women, and eleven children arrived at Roanoke Island, just inside the Outer Banks of North Carolina's coast. Financed primarily by Sir Walter Raleigh, the expedition was the second attempt to settle the region.

In 1584, a reconnaissance expedition to the Outer Banks, by Philip Amadas and Arthur Barlowe, had brought back two natives, Manteo and Wanchese, and had revealed the land to be suitable for colonization. Raleigh financed an expedition in 1585, led by Sir Richard Grenville, to establish an English garrison on Roanoke under the direction of Governor Ralph Lane. Such naturalists and artists as White and Thomas Harriot lived with the garrison from July 1585 to June 1586, collecting much information about the region and its inhabitants. In late July 1586, they returned to England on board Sir Francis Drake's ships, bringing positive word of an attractive and fertile land but also one of limited resources, poor harbors, and devastating storms. Raleigh subsequently financed the White expedition for 1587.

White's party intended to establish not a military garrison but an independent settlement in the Chesapeake area—a settlement that would be self-sufficient and live in harmony with the Chesapeake Indians. On the trip across the Atlantic, White and Simon Fernandes, the Portuguese pilot and a former pirate, argued repeatedly. When they arrived at Roanoke to consult with a garrison left there by Grenville in late 1586, Fernandes forced the entire party off at Roanoke.

Although they were concerned and disappointed, the colonists set about repairing the cottages and fort left behind by the previous expedition. They had brought back Manteo, who offered advice and then returned to his native settlement of Croatoan, near Cape Hatteras, not far away. Soon after their arrival at Roanoke, Elinor Dare, White's daughter and wife of his fellow settler Ananias Dare, gave birth to the first English person born in America—a baby girl they named Virginia Dare.

After unloading their supplies, the colonists decided that White should return to England to make sure that more supplies would be sent as soon as possible. White reluctantly agreed. Before leaving, White and the colonists determined that in his absence, the main body of the colonists would try to establish a settlement 50 miles inland (toward the Chesapeake area), while a small contingent would remain in Roanoke to meet White on his return.

White left in late August and arrived in England on November 8, 1587. He immediately met with Raleigh and asked that a relief force be organized. Raleigh initially assured him that supplies would be sent with all due speed. However, escalating conflicts with Spain (the Spanish Armada attacked in 1588) delayed White's return. He tried to send two pinnaces to Roanoke in 1588, but they were beset by French privateers and failed in their mission. When White finally did return to Roanoke in 1590 (as a passenger aboard Captain Abraham Cocke's man-of-war *Hopewell*), the colonists had disappeared; the only trace of the settlers was the word CROATOAN inscribed on a tree.

White believed the inscription signaled that at least some of the colonists had taken refuge with Manteo and his people at Croatoan. He asked that Cocke sail the 60 miles to the native settlement, but he encountered hostility from the crew. They were anxious to return to England to collect their prize money from recently captured goods and wished to leave the tempestuous seas of the Outer Banks, which had already caused several deaths by drowning.

The *Hopewell* suffered more damage from the weather and barely made it back to England on October 24, 1590. White could not persuade the otherwise preoccupied Raleigh to finance another venture to find the colonists, and he never returned to North America. Although the Roanoke colonists were never heard from again, White died convinced that they had still been alive in 1590.

Based on various forms of circumstantial evidence, some scholars speculate that the colonists had established settlements near the Chesapeake but Powhatan destroyed them shortly before the settlement of Jamestown in 1607. No conclusive evidence of this has been found. Roanoke finally became known in legend as the "Lost Colony," and the fate of the Roanoke colonists remains shrouded in mystery.

Rolfe, John (1585–1623)

Born in Norfolk, England, in 1585, to landowners John Rolfe and Dorothea Mason of Heacham Hall, little is known about the younger John Rolfe until he joined the Virginia Company in 1608 and sailed for America with his first wife, whose name is unknown. The ship on which they were traveling, the *Sea Venture*, was shipwrecked on the island of Bermuda, a story that later inspired Shakespeare's *The Tempest*. While marooned, Rolfe's wife gave birth to a daughter, named Bermuda, and he helped to break down the wrecked *Sea Venture* into three smaller vessels for the settlers' escape. Although the family reached Virginia by May 1610, both wife and daughter died shortly after their arrival.

Personally addicted to nicotine, Rolfe, an amateur Jacobean alchemist and chemist, conducted extensive agricultural experiments on the native tobacco plants in an attempt to establish a profitable staple crop for the colony. Unsatisfied by the results of his experiments, he smuggled in precious seeds of Spanish Orinoco tobacco, which yielded a crop of valuable leaves for export.

Established as one of Virginia's wealthiest landowners, Rolfe became smitten with another Virginia celebrity, Pocahontas, or Matoaka, daughter of Powhatan. She was living as a carefully held hostage at Jamestown after acting as a liaison between the English and her powerful father. Rolfe was concerned about his strong attraction to a non-Christian woman, and he wrote extensively to Sir Thomas Dale and the Virginia Company's authorities asking for instructions and approval of his courtship. When Pocahontas converted to the Church of England in 1613, taking the name Lady Rebecca, he wasted no time in courting her and gaining permission from Powhatan for them to wed at Jamestown on April 5, 1613.

This marriage regularized relations between the settlers and the Powhatan Confederacy. It further enriched Rolfe by bringing him land near Varina, as well as the expertise of an established tobacco growing culture. In 1616, he was promoted to recorder-general of the colony of Virginia, and he became a father again with the birth of his son Thomas.

That same year, the Virginia Company brought Rolfe and his family back to England on a promotional tour to recruit more settlers and gain investors in the growing tobacco market. Rolfe was offended by his treatment during the trip. His wife, now referred to as "Lady Rebecca," was given the status of visiting royalty at the court of James I; however, Rolfe was still considered a commoner, which necessitated embarrassing differences in their social presentation. Rolfe complained frequently about her stipend, their lodgings, and his seating at official events.

The Rolfes made a short visit to his brother and relatives in Norfolk, but he was anxious to return to his plantations. Before they could return to North America, Pocahontas became ill, probably from smallpox; she died at Gravesend in March 1617. Leaving young Thomas behind with his brother Henry, Rolfe returned to Virginia.

Shortly after his homecoming, Rolfe married Jane Pierce, a widow, by whom he had a daughter, Elizabeth, in 1620. Although it was often reported that Rolfe died in the March 1622 attack on Jamestown by the Powhatan, he survived that conflict and died sometime in 1623.

Rolfe left substantial property, including 1,700 acres at Mulberry Island and Varina, as well as his original land grant, to Thomas Rolfe, who never saw his father again and moved to Virginia only after 1640. Thomas Rolfe's many descendants formed a substantial bloc within the elite first families of Virginia. As grandchildren of Pocahontas, they necessitated exemptions in Virginia's laws against nonwhite property ownership and marriages.

All historical records concerning John Rolfe's daughter Elizabeth after the age of four were lost. Historians do not know if she survived to adulthood or left any heirs.

Rowlandson, Mary (1637–1711)

The author of the first captivity narrative in American history and only the second American woman to publish, Mary Rowlandson spent three months in 1676 as the prisoner of the Narragansetts during King Philip's War. Her best-selling *The Sovereignty and Goodness of God* (1682) provides a valuable perspective on the conflict that slowed New England's growth for a generation.

Born to farmers John and Joan White in Somerset County, England, in 1637, Rowlandson crossed the Atlantic with her parents as part of the great migration of Puritans. She arrived in Salem, Massachusetts, in 1639 and settled on her father's tract of land about 6 miles outside of town. The small, isolated community of late-arriving Puritans subsequently separated from Salem and formed the town of Wenham. Her family then moved to the frontier town of Lancaster, about 50 miles away.

In Lancaster, Rowlandson married minister Joseph Rowlandson around 1656. With this marriage, Rowlandson rose in status to become the most prominent woman in town and the only one entitled to the honorific "mistress" instead of "goodwife." The loss of status that Rowlandson later suffered during her captivity would be a recurrent theme in her biography.

A bold, independent, and pious woman, Rowlandson had borne at least three children by 1676. In that year, her husband went to Boston to plead for troops to defend Lancaster from expected native attacks by Metacom (King Philip) and his supporters. About 400 Narragansetts, Nipmucs, and Wampanoags from a large intertribal encampment at the Nipmuc town of Menameset about 25 miles to the south attacked Lancaster on February 10, 1676.

When English soldiers arrived, the Rowlandsons' garrison house soon stood engulfed in flames, while fourteen townspeople lay dead and twenty-three had been taken away as captives. By the end of March, English would flee Lancaster as too difficult to defend. Joseph Rowlandson remained in Boston and declined a position as army chaplain in order to devote his energies to securing the release of his family.

Mary Rowlandson then entered upon three months of captivity with her three children. Her infant Sarah died in her arms soon after their capture, while Rowlandson became separated from the other two when her captor sold her to another Narragansett. She may have decided to write her story as a means of dealing with the trauma of these events and of understanding the experience in Puritan terms.

In an era when women very rarely published, Rowlandson was likely prompted to seek an audience as part of Increase Mather's project to demonstrate the role of divine providence in the shaping of human lives and events. *The Sovereignty and Goodness of God* is a typical captivity tale in that it is the story of a morally pure white woman, who confronts the hellish terror of life among savages. The account is divided into twenty removes for the twenty occasions when Rowlandson and her captors broke camp and traveled. Biblical references are included to show that God was testing Rowlandson and her fellow colonists through the medium of a destructive war.

Rowlandson's captor Quinnapin was married to the squaw sachem Wetamoo of the Pocasset Wampanoag, and this placed the Puritan under the control of one of the most politically powerful Native American women. Despite this, Rowlandson refused to recognize Wetamoo's status and reacted angrily when the native people treated her as just another servant. Throughout the work, Rowlandson portrays natives as savages and Europeans as civilized people with chaste motives. Her blatant biases do not make the book a useful guide for Native American history but do show the refusal of Puritans to adjust to another culture.

As the war gradually turned in the colonists' favor, Rowlandson was ransomed and rejoined her family in Boston. In 1677, Joseph agreed to serve as minister at Wethersfield, Connecticut, and he capitalized on his wife's fame to secure a salary that made him one of the highest-paid clergymen in New England. He did not enjoy his status long, however, leaving Rowlandson a widow in 1678.

Her status and money ensured that Mary Rowlandson did not remain single for long. Within the year, she married wealthy landowner Samuel Talcott, also of Wethersfield. Widowed again in 1691, she died in January 1711.

Rowlandson's book became a best seller in colonial New England and has been continually in print since 1770. One of the rare autobiographies of a colonial woman, it provides valuable insight into Puritan thought, as well as instruction about the cultural tensions that led to King Philip's War.

Royal African Company

Over the course of eighty years (1672–1752), the Royal African Company played an integral role in the transatlantic slave trade. Chartered in England by Charles II as a joint-stock company in 1672, the Royal African Company conducted trade along the coast of Africa from the Senegal River to Angola. The establishment of slave forts in these regions facilitated the company's trade and provided protection from rival nations.

During the first two decades of its existence, the Royal African Company maintained a monopoly of the slave trade. The company controlled the English trade to the West Indies and the English colonies in North America until 1698. In addition to its trade monopoly with the English colonies, the company also received the Spanish *asiento*, granting it exclusive rights to supply the Spanish colonies with slaves.

Although the Royal African Company maintained a monopoly of the English and Spanish trade, it faced competition from other European trading companies. Prior to 1672, Denmark, France, Holland, Portugal, and Sweden each established chartered companies to engage in the slave trade from Africa.

As a complex business, the slave trade from Africa required considerable organization on both sides of the Atlantic. Ships departed from prominent ports such as Bristol or Liverpool carrying trade goods for sale along the West African coast. Trade goods included an assortment of items such as beans, beer, brass, candles, chairs, cider, copper, earthenware, glasses, gunpowder, guns, haberdashery, kettles, salt, and textiles.

These items were traded for enslaved Africans. The Royal African Company also purchased ivory, gold, and various exotic woods; however, enslaved Africans comprised 40 percent of the Royal African Company's trade in Africa. Captive Africans were transported to the West Indies or North America, where they were sold. The proceeds of these sales, along with items procured in Africa and plantation cash crops from the colonies, were then brought back to England.

In 1698, Parliament opened the slave trade to any English subject who could pay the 10 percent ad valorem tax on all goods and slaves exported out of Africa. The Royal African Company received the proceeds of this tax to pay for the maintenance of its forts in Africa. As English subjects, American merchants received licenses to participate in the slave trade, provided that the Royal African Company received the prescribed 10 percent of their profits.

The Chesapeake colonies, Middle colonies, New England colonies, and low-country colonies developed different economies and labor needs. In the Chesapeake colonies of Virginia and Maryland, African slave labor replaced the labor of white indentured servants on tobacco plantations during the 1680s. Prior to this time, the majority of Africans who came to the Chesapeake colonies arrived from the West Indies through the Atlantic trade with the British Caribbean. By 1686, seven Royal African Company ships with over 1,400 slaves had arrived in Virginia. The number of Africans imported into the Chesapeake continued to increase; during the first four decades of the eighteenth century, 39,000 slaves entered Virginia.

The Royal African Company also provided slaves to New York, following the Dutch cession of New Amsterdam to the British in 1664. Slaves for the New York market also arrived in New Jersey, which did not impose an import duty on slaves. Most African slaves brought to the New York area were used to work the large estates along the Hudson River. Africans also were employed as servants, artisans, cooks, and coachmen.

During the eighteenth century, most British slave ships were built in the American colonies. In this context, Massachusetts and Rhode Island developed a thriving lumber industry and maintained productive shipyards for the trade.

Rum production also flourished in the New England colonies. The expansion of New England merchants in the trade made American-produced rum an important commodity for trade with African rulers, particularly during the 1690s, when wars in Europe disrupted the traditional trade routes of the Royal African Company.

In the years preceding its dissolution, the Royal African Company provided slaves for the expanding rice plantations of South Carolina. Between 1735 and 1740, the company imported 11,000 slaves from Angola and the Gambia region to meet the colony's labor demands.

The company's subsequent bankruptcy and reorganization diminished its capacity to control the trade from Africa. In 1752, the Royal African Company was dissolved.

Rush, Benjamin (1745–1813)

Benjamin Rush, physician, patriot, and reformer, was educated in the household of Samuel Finley, his maternal uncle, and at the College of New Jersey (later Princeton) under the tutelage of Samuel Davies. Finley's discipline and Davies's Presbyterian gospel of public duty instilled in Rush a deep piety and commitment to social welfare that stayed with him throughout his life.

Rush received his bachelor of arts degree in 1760 and soon sailed for Europe to attend Edinburgh's prestigious medical school. After receiving his medical degree in 1768, Rush returned to the colonies and set up in practice in Philadelphia. In 1769, he was appointed professor of chemistry at the College of Philadelphia; he was the first native-born American to hold that position.

Dr. Benjamin Rush was one of the leading men of science and social reformers of his time. He founded America's first free dispensary, wrote its first chemistry textbook and first treatise on mental illness, and was an early advocate of women's education. (The Stapleton Collection/Bridgeman Art Library)

Thus equipped with a small income and good prospects and imbued with a zealous urge to improve his city and his world, Rush turned his attention to politics and the growing tensions with Great Britain. As early as 1769, he was arguing privately for economic autonomy and domestic production as the surest path to liberty. Going public in 1773, he coauthored a newspaper piece appealing to readers to keep East Indian tea out of American ports. After Lexington and Concord, he began encouraging his friend Thomas Paine to compose a persuasive tract to argue the case for political independence, suggesting the title *Common Sense*.

Rush served as Pennsylvania's delegate to the second Continental Congress (1774) and signed the Declaration of Independence (1776). That same year, he married Julia Stockton, the daughter of family friends and fourteen years his junior. In 1777, he was named surgeon general of the Middle Department of the Continental army and served diligently until he resigned, after criticizing General Washington's failure to improve medical conditions in the field.

Returning to private practice and college teaching, Rush became deeply disillusioned by the way the republican experiment was unraveling in postwar Philadelphia. A lower-class group of self-proclaimed "egalitarians" had seized control of state government, instituting a unicameral legislature that Rush perceived as a seat of arbitrary power more dangerous than monarchy. To heal the wounds of such factionalism and to revive his dream of a republican utopia, Rush set about creating a network of voluntary associations that encompassed prison welfare, health care, temperance, exercise, Sunday schools,

missionary societies, and African church organizations.

In addition, Rush cared passionately about the state of female education in the new United States, advocating that ladies should be sufficiently educated “to concur in instructing their sons in the principles of liberty and government.” To train a generation of young ladies to bring up good-citizen sons, Rush established the Young Ladies' Academy in Philadelphia, a model imitated nationally, where students studied reading, writing, bookkeeping, arithmetic, geography, history, vocal music, Christian religion, and Bible reading. Rush's mission to educate the future of the republic also extended to the men of the Pennsylvania backcountry and culminated in the foundation of Dickinson College in Carlisle in 1783.

As a teacher of medicine, Rush was the most influential physician in America. His son estimated that 2,872 students were registered in his medical classes between 1779 and 1812 at the College of Philadelphia and the University of Pennsylvania (from 1792). He was the author of a popular syllabus on chemistry and published several important medical treatises on cholera, dropsy, measles, cancer, tuberculosis, and dengue.

During the yellow fever epidemic of 1793, which claimed one in ten of his fellow Philadelphians, Rush worked tirelessly to treat the sick and prevent the spread of the disease. His insightful efforts to improve public sanitation won him many endorsements, but his seemingly indiscriminate bloodletting proved deeply controversial and led to claims that he was contributing to the death toll.

Overall, however, Rush's medical contributions were more positive. In 1786, he had established the nation's first free dispensary, and he sponsored many preventive programs, including a course of smallpox inoculations and, later, vaccinations. And as a result of his advocacy for humane treatment of the insane and his authorship of the first comprehensive medical treatise on mental illness, Rush is justly called the Father of American Psychiatry.

As his reputation grew, Rush was appointed to several honorary positions, such as treasurer of the U.S. Mint in 1797 and scientific adviser to the Lewis and Clark expedition in 1803. Mixing in increasingly lofty circles, it was Rush who finally healed the ancient rift between John Adams and Thomas Jefferson.

In the spring of 1813, the doctor, by now Philadelphia's first citizen, fell ill. After bleeding himself twice, he died five days later at his home.

Saint-Domingue

The French colony of Saint-Domingue, situated in the western third of Hispaniola, was the main overseas component of the French Empire. It developed into the world's most prosperous colony of the eighteenth century. Saint-Domingue should not be confused with Santo Domingo, which refers to the Spanish colony on the eastern part of Hispaniola or its main city, after which both the Spanish and the French colonies were named.

In the course of the French Revolution, Saint-Domingue (then renamed Haiti) gained independence as the second state of the New World after the United States. This is a unique and meaningful case, as it is the only example before the twentieth century of the governmental power of a colonized country being passed to the most deprived social group—in this case, former slaves and poor free persons of African descent.

The Emergence of the Colony, 1630–1720

The colony of Saint-Domingue was born out of anarchism. Originally the Spanish had colonized Hispaniola from 1492 onward, virtually extinguishing its Arawak population within years. The city of Santo Domingo, founded on the southeast coast, became the earliest center of the Spanish-American empire before the focus moved to the American mainland and to the Cuban naval base of Havana. The Windward Passage—between Hispaniola and Cuba, its northwestern neighbor—and the vicinal coasts of both islands were under weak control of the authorities, as the urban footholds of Spanish power—Havana and Santo Domingo—were situated on the opposite coasts of the respective islands. This lack of official control encouraged traffic in contraband

between the coastal Spanish inhabitants and the French and English buccaneers. To repress this illegal commerce, the Spanish decided to withdraw from western Hispaniola in 1605. This move, on the other hand, gave the pirates the opportunity not only to use the Windward Passage as a forbidden back door to the Caribbean but also to establish footholds there.

At first, around 1630, settlement focused on Tortuga Island, in front of the northwestern coast of Hispaniola. Settlers trickled into the main island from the 1650s onward. In 1670, Cap François (today Cap-Haïtien) was founded on the northern coast and developed into the island's main city, only in the late eighteenth century to be rivaled by Port-au-Prince, the capital of Saint-Domingue, or Haiti, since 1749.

In the beginning, both French and English pirates took seats on Hispaniola, but this coexistence, just like the rather anarchic disposition of the settlements, quickly came to an end. The French government had established colonies in Guadeloupe, Martinique, and some smaller Caribbean islands since the 1620s and had even appointed military governors to Tortuga since 1642. But only in the 1660s did Jean Baptiste Colbert, appointed secretary of finance by Louis XIV, intensify colonization in the New World. A new French West India Company was advised to enforce settlement on the main island of Hispaniola. Bertrand d'Oregon, governor from 1665 to 1676, contributed most to turning the piracy settlement into a formal French colony. The country was divided into northern, western, and southern departments, following the mountain chains stretching from east to west.

Later on, the head of the colony's administration became twofold, as in 1705—formally in 1719—the military governor was joined by an *intendant*, a delegate of the French government. Although the governor focused on military concerns and the intendant on financial matters, they shared in leading the administration and thereby controlled each other.

Before the first intendant arrived, military conflict with Spanish and English forces occupied the governor's attention. Even though the land was ceded by the Spanish to the French in the Treaty of Ryswick in 1697, the outbreak of the War of the Spanish Succession in 1702 revived fighting between the European powers in the Caribbean, until the Treaty of Utrecht was signed 1713. In the following years, the focus shifted from the military to the economic development of Saint-Domingue.

The Unfolding of Economy and Society, 1720–1790

Even in the seventeenth century, the coarse commerce of piracy was not the only economic activity on Saint-Domingue. The settlers cultivated land for self-supply and also grew tobacco for sale. This crop was encouraged by the authorities, but around 1720 the growing of tobacco was ousted by a modern plantation economy.

The main product was sugar. Saint-Domingue contributed the lion's share of sugar production to the annual yield of about 65,000 tons, which put the French colonies ahead of the British, making them the market leaders around 1760. At first, indigo took second place in Saint-Domingue's foreign trade. By the 1780s, output had stagnated and the dyestuff had fallen back to third place, but Saint-Domingue still provided about 1,000 tons, or half of the world's production.

A rapid extension of coffee cultivation between 1765 and 1780 more than tripled the annual yield to nearly 40,000 tons, or two-thirds of the world's produce. Cacao also was grown until about 1740, and cotton became a fourth major product of Saint-Domingue, with about 500 tons in the late 1760s and 1,000 tons around 1790.

Thus, the economic relevance of the colony was enormous. Consequently, after losing the Seven Years' War, the French government ceded the whole of Canada to the British to secure possession of Saint-Domingue in 1763.

In 1789, some 2.5 million acres of land were cultivated on about 7,800 plantations. The plantation economy was the most effective but also a cruel preindustrial system of production, an intense single-crop agriculture relying on the exploitation of slave labor. Saint-Domingue is a very illuminating example of the plantation system, as nowhere else did it generate such vast economic growth and have such grave consequences for the composition of the society.

By 1790, between 500,000 and 700,000 slaves were living in Saint-Domingue, more than in the whole of the United States at that time. Slaves constituted about 20 percent of the U.S. population, but 90 percent of Saint-Domingue's. The small layer of about 60,000 free people again stratified. The bottom half was made up of the so-called *affranchis*, mulattos and freed slaves. The upper half was formed by the *petits blancs* ("small whites") and the richest and most powerful *grands blancs* ("big whites"). Three-quarters of the whites and two-thirds of the black slaves had not been born in Saint-Domingue. This indicates the extent to which the growing economy affected the fabric of this society.

The same goes for the gender imbalance of these classes: About 60 percent of the slaves and even 80 percent of the whites were male. The overabundance of white men emboldened prostitution—55 percent of the free colored people were female—and encouraged interracial sexual relations. This was the main reason for the growing number of *affranchis*, who had accounted for no more than a third of the free population until the 1760s. Their imminent outnumbering of the white population increased social tension, especially as, in contrast to whites and slaves, nearly all free colored people had been born in Saint-Domingue but could gain no social standing or even political participation in their country.

The Haitian Revolution, 1790–1804

The tremors of the French Revolution, starting in 1789, tempted different social groups in Saint-Domingue to improve their position. Analogous to the French National Assembly, an assembly of the free people of the colony was allowed. Still, to what degree the free colored people should participate remained controversial.

Completely excluded by the *grands blancs*, the *affranchis* revolted, to no avail, in 1790. When, on the other hand, the French government tried to pacify the mulattos by granting civil rights to the wealthiest among them in 1791, the whites objected and fighting flared up again.

More seriously, a slave rebellion broke out in August, involving up to 80,000 slaves by November. To obtain allies against the rebellion, the government gave civil rights to all *affranchis* in 1792. But the disintegration of the country continued, especially when, in 1793, French, Spanish, and British forces

arrived. Different factions of the rebels allied with different European powers.

The former slave Toussaint L'Ouverture joined the slave revolt sweeping the French colony of Saint-Domingue (later Haiti) in 1791. He rose to a position of power and ultimately led the nation to independence—making it the first in Latin America to attain that status. (Bibliothèque Nationale, Paris, France/Roger-Viollet, Paris/Bridgeman Art Library)

In 1794, during the most radical phase of the French Revolution, slavery was abolished in all French colonies. This caused François Dominique Toussaint-L'Ouverture, a former slave and the most successful rebel leader allied with the Spanish, to change sides and unite with the French forces. By 1795, the Spanish troops had been expelled; by 1799, the British occupiers had withdrawn; and, in 1801, even the Spanish part of Hispaniola was taken.

Toussaint-L'Ouverture was a charismatic and able but also rigid and sometimes cruel politician, and he ousted both white and colored rivals for power. With French consent, he enacted a constitution and made himself lifetime governor general in 1801; however, Napoleon wanted to re-establish slavery in all overseas parts of his empire. Toussaint-L'Ouverture was placed under detention in 1802 and died in France in 1803.

The fear of slavery again empowered a rebellion. An army of blacks and mulattos, led among others by the former slave Jean-Jacques Dessalines, succeeded in definitively driving the French from the island. On January 1, 1804, Dessalines declared Hispaniola independent and became its emperor later that year.

The Europeans and the United States showed little sympathy for the new state. It became a bogey also for the colonial elite, as it proved that the colonial social order could be turned upside down. Hence, this case had an enormous impact on the process whereby the Latin American colonies became independent.

War had devastated the cultivated land, and both international isolation and internal struggles hampered economic recovery, so the richest land of the Caribbean developed into one of the poorest. And the colonial name of Saint-Domingue vanished.

The new state, soon again limited to the western part of Hispaniola, was renamed Haiti, the original Arawak expression for the island, meaning "mountainous." This indicates the difficulty of finding a national identity, as the Arawaks had been extinguished well before the French set foot on the island or the coming of the displaced blacks who formed Haitian society.

Salem

The site of the largest and most infamous witch hunt in American history, Salem was the first town settled by nonseparating Puritans in Colonial America. Despite the witch hysteria and the religious and civil turmoil caused by the separatist Roger Williams, Salem's growth as a commercial seaport propelled the Massachusetts city to the forefront of colonial politics during the Revolutionary era.

Three years after the separatist colony of Plymouth was established in 1620, a group of farmers, fishermen, and trappers landed at Cape Ann, Massachusetts, on a quest for riches. Having little success, most of the company returned to England within five years. Led by Roger Conant, the remaining settlers found sheltered, fertile land at the mouth of the Naumkeag River. Their settlement, which was called Naumkeag in 1626, was renamed Salem in 1629 for the Hebrew word *shalom*, or peace.

Best known as the site of the witch trials of 1692, Salem, Massachusetts, was the first town settled (in 1626) by non-separating Puritans in colonial America. It became a fishing, building, and maritime trade center in the eighteenth century. (© Peabody Essex Museum, Salem, Massachusetts/Bridgeman Art Library)

The New England Company, which was granted permission to settle and govern the area, sent Captain John Endecott, a Dutch war veteran, to preside over the new town. Under his leadership, the first nonseparatist Congregational Church in Massachusetts was founded at Salem on July 20, 1629.

Because of its location, Salem was the destination for John Winthrop's fleet. Only a few weeks after their arrival in June 1630, however, Winthrop and his followers moved to the more sheltered and spacious bay. Although the Salem Church had not separated from the Church of England, its acceptance of the separatist Roger Williams as a member in 1633 and as minister in 1635 raised a stir among the religious and civil leaders throughout the colony. As minister, Williams insisted that the king's land patent in New England was invalid and that civil government had no authority over religious affairs. The members of his congregation agreed with these claims. Their support, however, waned, as Williams boldly claimed that all churches outside of Salem were not pure and must be renounced as false. Having lost the support of his congregation, in October 1635, the General Court ordered Williams to leave the colony. His removal to Rhode Island in January, however, did not mark an end to the civil and religious turmoil that would later engulf this settlement.

By the beginning of the 1690s, the diverging interests of the people of Salem Village, which had recently been established as an independent settlement from Salem Town, led to an outbreak of witch hysteria unparalleled in American history. Factions within the village emerged, as people expressed either support for or opposition to Samuel Parris, their new minister. The opposition between these factions, normally split along economic and social lines, was heightened when, in January 1692, a group of girls began to show symptoms of what village leaders believed to be demonic possession. Accusations of the practice of witchcraft were directed at factional opponents and especially at women who defied traditional norms for their class and gender.

A special court was convened in Salem Town to try the suspected witches. On June 2, 1692, Bridget Bishop, accused of being a witch, was condemned; she was executed by hanging eight days later. This first execution brought new fervor to the episode; accusations and arrests spread through the village and to the surrounding towns. As additional "witches" were condemned and executed, anxiety swept through the colony. In an attempt to avoid the punishment of death, accused witches began to confess and even to implicate others. Hundreds were arrested and imprisoned, and numerous ministers, civil leaders, and lay people began to oppose the proceedings of the court.

By late October, Governor Sir William Phips suspended the trials and eventually pardoned all remaining prisoners. The witch craze ultimately claimed the lives of almost two dozen men and women. Although apologies and monetary restitution were later made, the events of 1692 remain a dark mark on Salem's history.

Despite these events, Salem developed into a major fishing, building, and maritime trade center during the eighteenth century. Its commercial successes and population growth thrust Salem into the spotlight during the Revolutionary period.

In 1774, a provincial congress was organized in the town, and two months before the hostilities at Lexington and Concord, skirmishes between Americans and British soldiers broke out on Salem's streets. During the war, Salem's fleet captured or sunk over 450 British vessels. When the United States was finally organized after the Revolution, Salem was the sixth-largest city in the new country.

Santa Fe

Santa Fe was, and remains today, the capital of New Mexico, which was the most populous and successful settlement on New Spain's northern frontier. The Spanish settled Santa Fe around 1608, when Juan de Oñate, the first Spanish colonizer of New Mexico, began to move some of his settlers south from San Gabriel. In 1610, Pedro de Peralta, the governor of New Mexico, made Santa Fe an official villa and the capital of the colony.

Pueblo Indians already lived in Santa Fe when the Spanish settlers moved there. In fact, Spaniards forced the Pueblos to labor as part of the *repartimiento*, in which the native peoples were made to work on public projects. In this manner, the Pueblo built Santa Fe for the Spanish settlers.

For decades, Spaniards and Native Americans continued to live together in Santa Fe and northern New Mexico with intermittent conflict. Missionaries in New Mexico labored to convert the native peoples to Christianity, and these missionaries' repression of native religion and treatment of the natives were harsh at times. The missionaries and government officials also quarreled with each other and fought over native labor. Sometimes, the Pueblos were able to play the two sides off against one another to negotiate better treatment.

In the 1660s and 1670s, drought led to crop failure, livestock deaths, and famine. The Apache and Navajo, who also were suffering from the drought, made more raids on the Pueblo. As a result of these difficulties, many Pueblos abandoned Christianity and returned to their native religion.

A San Juan Pueblo Indian named Popé organized most of the Pueblos in a coordinated revolt that occurred on August 10, 1680. Pueblos killed about 400 of 2,500 settlers in New Mexico, but the natives largely directed their anger toward missionaries and religious objects, killing twenty-one of thirty-three missionaries and destroying churches. Many Spanish survivors fled to Santa Fe and continued to fight, until they realized they could not win and fled to El Paso on September 21, 1680.

The Pueblo peoples maintained control of Santa Fe and northern New Mexico for about a decade, until Diego de Vargas reconquered the region in 1692 and 1693. When the Spaniards returned, they lessened demands on the native peoples for labor and allowed them more religious freedom.

The nonnative population of Santa Fe increased throughout the eighteenth century. In 1750, the population of Santa Fe included 965 nonnatives and 570 natives. By 1790, Santa Fe consisted of 2,997 nonnatives and 598 natives.

From the time the Spaniards first arrived, Native Americans became part of Spanish households. Many of these native peoples were *criadas*, or servants, who had been taken in war by Spaniards or rescued from Plains Indians, who were holding them captive. These *criadas* were raised in Spanish households and taught Christianity. Some were adopted into families formally or as godchildren. Treatment of servants ranged from incorporation as family members to sheer cruelty.

The high number of female servants contributed to the unbalanced sex ratio of the Santa Fe population. There were more women in Santa Fe than men, making Santa Fe an unusual settlement on the frontier of New Spain, where men more often outnumbered women.

The late 1800s saw major changes affecting Santa Fe. In 1786, Spanish officials negotiated a peace with the Comanche, which led to relative peace for

several decades and allowed settlers to expand beyond the town limits. Government reforms, known as the Bourbon reforms, increased money circulation and regulated taxes more accurately, stimulating the economy of New Mexico. Settlers in northern New Mexico traded in Chihuahua, as well as at Taos with Plains Indians.

After Mexican independence in 1821, Santa Fe became the locus of an international trade route known as the Santa Fe Trail. Starting in Missouri, American merchants brought manufactured products to trade for mules and silver in Santa Fe. Many merchants who participated in this trade became wealthy. The trade also changed Santa Fe and New Mexico, because of the influx of foreigners and manufactured goods.

During the United States-Mexican War from 1846 to 1848, Stephen Kearney took Santa Fe and New Mexico with little fighting, but within months there were various challenges to American control. Following the war, New Mexico became a permanent part of the United States, and Santa Fe remained the capital of New Mexico.

Savannah

In early 1733, James Oglethorpe scouted a location for Georgia's first permanent settlement. He selected an elevated site on Yamacraw bluff, several miles upstream from the mouth of the Savannah River. The new town drew its name directly from the nearest major geographic landmark: Savannah.

The settlement's street plan was distinctive, calling for sizable public squares at frequent intervals. Today, these are still the town's most recognizable and celebrated decorative features. In the colonial era, they were used for a variety of practical purposes—markets, public gatherings, and even places of refuge in times of war for people in outlying villages.

Savannah, Georgia, a major Southern port just above the mouth of the Savannah River, was laid out in 1733 by James Oglethorpe into forty-lot wards, each centered on an open square. Beyond the downtown wards were gardens and farms for every colonist. (Brown Brothers, Sterling, Pennsylvania)

Physically, Savannah's location appeared ideally suited to promote economic growth. The nearby native population offered opportunities for trade, and the waterfront could hold an estimated 400 vessels at once. However, Savannah was economically stagnant during its early years. The Native American trade quickly shifted westward to the town of Augusta.

Additionally, the Savannah River's depth near the Atlantic Ocean proved unpredictable; even experienced pilots grounded ships surprisingly often. Many merchants adopted the awkward expedient of loading or unloading a portion of their cargoes on the coast in order to reduce the draft of their ships as they entered the river.

Another difficulty was that Savannah held little attraction for merchants during its first two decades. As late as 1760, the town was a motley collection of 200 or so wood buildings, and an aura of impermanence hovered over it. The close proximity of the prosperous port at Charles Town meant that most goods imported into early Georgia passed through South Carolina. The leading Savannah merchant house of Habersham and Harris did most of its buying and selling in the neighboring province rather than London.

The situation did not change until Georgia experienced its first prolonged economic expansion in the 1760s. In 1761, only 41 ships cleared Savannah's harbor. A decade later—driven by a developing plantation society and booming rice exports—that number had jumped to 217 vessels, as the young port began to emerge as a worthy destination in its own right.

Savannah's newfound prosperity was reflected in its population and improved physical appearance. From an initial seeding of 114 settlers in 1733, it had grown to a bustling seaport of some 3,500 inhabitants by the eve of the American Revolution. The once empty waterfront was now lined with tidy warehouses holding valuable commodities bound for destinations throughout the Atlantic world.

Just as Savannah's economy was slow to develop, so, too, was its culture. Early shipments contained few books other than tracts intended to foster obedience and industry in the colonists. Education was largely in the hands of private tutors. By the 1740s, Savannah took a few important developmental steps. The Bethesda Orphanage and school instructed parentless children in theology and the classics, and an informal public lending library was run out of the Savannah rector's residence. Two other libraries soon developed. Savannah achieved its first true literary landmark with the 1763 launch of the *Georgia Gazette*, the province's first regular newspaper.

The population was not large or cosmopolitan enough, however, to sustain the arts. Plays and performances entertained residents from time to time, but Savannah never had a permanent theater. In some ways, Georgia's cultural life stayed undeveloped as compared to cities in other colonies.

The one realm in which Savannah consistently excelled was political agitation. As the province's capital and major trade center, the town became the focal point for opposition to various policies implemented by British authorities. During the first two decades of Georgia's existence, a group of town residents, referred to derisively as "malcontents," led an effective lobbying campaign in America and England against the Georgia Trust's restrictive policies on the ownership of land and slaves.

Two decades later, the town experienced riots in opposition to the 1765 Stamp Act, though these did not approach the ferocity of demonstrations in other parts of America. In ensuing years, however, Savannah's Sons of Liberty branch protested new imperial taxes more vehemently than did people in other areas of the colony.

During the American Revolution, Savannah was again the center of political conflict over the province's future. A British expeditionary force captured the city in 1778 and tried to use it as a base to reassert royal control over the colony as a whole. This strategy achieved decidedly uneven results until the English permanently withdrew in 1782. The new state was left to find its own way in the infant American nation.

Science

The European discovery of America was contemporary with the early modern scientific revolution, and America and science interacted from the beginning. America was a subject of interest to European scientists from its discovery, but it was not until the eighteenth century that the colonies developed self-sustaining scientific communities of their own.

Impact of America on European Scientific Knowledge

In addition to a mass of fascinating new data, America presented a fundamental challenge to the worldview of early modern European natural philosophers, whose "scientific revolution" corresponded chronologically with the first two centuries of colonization. The basic intellectual problem, once it was realized that the Americas were not an extension of Asia, was the lack of awareness shown both by Greek and Roman classical writers and by the Bible.

There were attempts to graft classical and biblical knowledge onto the Americas. Some suggested that the Native Americans were the ten lost tribes of Israel, and even though that was never a majority opinion among European thinkers, nearly all agreed on the necessity of fitting them into the biblical framework of descent from the sons of Noah. Some argued that America could be found in the Bible, or that various places in the New World were named after biblical figures. But Europeans gradually became aware that America was not dealt with specifically either by the classics or the Bible. The myriad of new plant and animal species encountered eventually made much of classical natural history, as well as geography, obsolete. Amerigo Vespucci specifically pointed out the abundance of new species not mentioned by the ancient Roman natural historian Pliny the Elder.

European expansion became the standard example for those who argued that modern civilization had advanced beyond the classical world. The would-be intellectual revolutionary Francis Bacon specifically compared himself to Columbus, and the frontispiece of his *Great Instauration* (1620) showed a ship sailing past the Pillars of Hercules, the western limit of the Mediterranean and a symbol of the limits of ancient knowledge.

The initial impact, intellectual and otherwise, of the New World discoveries was greatest by far in Spain, which received most of the new information. Spanish investigators dominated sixteenth-century New World natural history, producing a long series of works of which the earliest notable example is Gonzalo Fernández de Oviedo y Valdés's *Natural History of the Indies* (1526). The most complex debates on New World peoples and subjects in the sixteenth century were carried on in Aristotelian terms in the very conservative Spanish universities, particularly the University of Salamanca. The Spanish debate on the status of the Native Americans was the last major European intellectual debate to be framed entirely in Aristotelian terms.

European attitudes toward indigenous scientific knowledge varied. In all places, specifically local knowledge of geography, natural history, and local diseases was valued. The importation and cultivation of new crops—tobacco, tomatoes, corn, potatoes, and chocolate—required some appropriation of indigenous knowledge. The Mayan and Aztec calendars provoked curiosity and respect from European chronologists. But indigenous knowledge received little study in the more theoretical and abstract areas of natural philosophy, and interest in indigenous knowledge declined in the course of colonization.

Natural History

Much Spanish writing on the New World was translated into other European languages. The disciplines most transformed by the new knowledge were those of natural history, botany, and zoology. New natural knowledge came to Europe in a flood, particularly from the only recently encountered lands of the West. All kinds of previously unknown plants and animals had properties that had to be worked out with some help from indigenous informants but little from the ancient authorities.

Medicine was another local science drawing on both European and indigenous sources of knowledge. Colonial medicine was particularly important in the tropics, where diseases occurred that had no European precedents. Europeans were particularly interested in the medical properties of strange plants, and many of the scientific explorers and knowledge gatherers sent from Europe were physicians, such as Francisco Hernández, the Spanish physician who led a scientific survey of Mexico from 1571 to 1577.

Europeans were sometimes carried away with enthusiasm over the medical potential of foreign plants. For example, tobacco, a New World plant, was hailed as a wonder drug. It was claimed that it could cure migraine, cold stomach, kidney pain, hysteria, gout, toothache, worms, scabies, nettles, burns, wounds from poisoned arrows, and gunshots. Tobacco was also viewed as psychologically beneficial in calming the mind and making men more attractive to women.

In European colonial possessions, the creation of an exhaustive natural history both inventoried a colony's natural resources and made a textual claim on it. The production of such natural histories, however, required a substantial commitment of resources both to the collection of knowledge and to its publication in book form. Hernández's ambitious and state-sponsored natural history of Mexico was never published in its complete form, and the proposed natural history of Virginia that Thomas Harriot was involved in never got past its initial stages due to poor financing and the general shakiness of the English position in Virginia.

The tradition of European investigation of the natural history of foreign lands continued throughout the early modern period, although the predominantly medical interest of many of the early naturalists faded by the late seventeenth century in favor of a less use-oriented view. Curios, dried plants, and stuffed animals from foreign lands became the subjects of an international trade, mostly centered in Amsterdam during the seventeenth century and appealing to European collectors and museums.

While natural history specimens flowed from America to Europe, American scientists suffered both from intellectual isolation and from the difficulty, if not impossibility, of obtaining scientific equipment. The most important original scientist produced in the seventeenth-century British colonies, the physician and alchemist George Starkey of Bermuda and Harvard College, emigrated to England in part because of the dearth of laboratory equipment in New England.

Science in the Colonies

As Europeans established permanent settlements in the New World, the institutions and practices of European intellectual life went with them. Institutions such as the University of Mexico City or Harvard University mostly taught an Aristotelian curriculum, adapting to new intellectual currents with some time lag relative to Europe. But colonial institutions and groups could never compete with their counterparts in Europe as generators of new knowledge.

English science in the New World differed from French and Spanish in not being state-sponsored. Much English science, Harriot's *A Briefe and True Report of the New Found Land of Virginia* being the most notable example, was produced by individuals or groups hoping to promote colonization. As such, it had a promotional aspect.

What intensified English science in the Americas was the founding in 1660 of the Royal Society for the promotion of natural knowledge—a London-based organization with state sponsorship but financial and organizational independence. The first colonial admitted was John Winthrop, Jr., who was visiting London at the time. Winthrop was a practitioner of medicine and alchemy, and he brought the first telescope to New England. Over the period from 1660 to 1783, fifty-three colonials would be admitted as fellows (although twenty were colonial governors admitted primarily for their political prominence), and

over 260 letters from colonials were published in the Royal Society's journal *Philosophical Transactions*. Colonial fellows benefited from not having to pay admission fees or dues until 1753, when the society's financial needs caused the exemption to be abolished. (Difficulties in communication could still lead to problems, as when Cotton Mather was wrongly accused of falsely passing himself off as a fellow because his name did not appear on printed lists of fellows.) The Royal Society also sent lists of "queries" with persons journeying to the colonies in hopes of gathering information systematically.

Colonial scientists in the seventeenth century were a heterogeneous lot, but two groups prominently represented were physicians and ministers. Physicians were the group with the most education in the sciences, and ministers like Cotton Mather, in addition to a high level of education and a habit of reading, viewed science in terms of "natural theology." Mather's *The Christian Philosopher* (1721) was one of many works using the properties of the created world to exalt the glory and providence of God. In the eighteenth century European colonies in the Americas developed their own scientific communities and institutions, which increasingly claimed independence from their European peers.

Natural history continued to be the quintessential colonial science. The immediate fieldwork of natural history could only be carried out on the spot, either by colonial residents or by visitors from the metropolis. Colonial residents joined networks of correspondence and exchange, but usually as subordinates. European scientists were particularly interested in animals and plants unique to the New World, and some of them touched off scientific controversies.

It was debated in both Europe and America whether rattlesnakes had the power of charming or "fascinating" their prey, or whether the pouch of the female opossum was actually a womb. (Opossums, the only marsupials known to European science before the discovery of Australia, presented several problems in classification.)

British collectors such as James Petiver or Hans Sloane (who had come to Jamaica as physician to the governor and written a book on its natural history) established networks of contacts in the Americas from whom to receive specimens for their collections. The London Quaker merchant Peter Collinson was a correspondent of the leading mid-eighteenth-century colonial scientists and served as their agent in London. John Bartram of Philadelphia, despite his lack of formal training, parlayed his connections with Sloane and other English collectors into a leading position in American botany. Mark Catesby, by contrast, was an Englishman commissioned to bring back specimens from the colonies, as well as to write a natural history.

Eighteenth-Century Science

The eighteenth century, with the expansion of astronomy and cartography, also saw the spread of observatories and programs of observation outside Europe, since it was often necessary or beneficial that astronomical phenomena, such as the transits of Venus, be viewed from many places on the globe. The need to establish the exact location of isolated ports and islands spurred scientific endeavor. However, colonial astronomy and surveying still filled the traditional colonial role of providing data for compilation and analysis in Europe.

Science in the colonies was practiced in institutions and settings resembling Europe's. Like British universities, colonial universities switched from an Aristotelian curriculum to a Newtonian one. A key moment was the founding of the Hollis professorship in Mathematics and Natural Philosophy at Harvard in 1727. Its first two incumbents, Isaac Greenwood and the astronomer John Winthrop, Jr., did much to spread advanced physics, astronomy, and mathematics in New England. At Yale, Thomas Clap, president of the university from 1745 to 1766, also promoted modern science in the curriculum.

The universities were not the most dynamic centers of western science in the eighteenth century; however, scientific societies were. British America's first enduring scientific society was the American Philosophical Society, founded in Philadelphia in 1768. (A similar phenomenon took place in French colonies. Saint-Domingue had a private group with some public support, the Circle of Philadelphes founded in 1784. It eventually received a royal charter.) Many of the medical societies and library companies formed in the mid-eighteenth century also had scientific interests. Informal groups of persons interested in science existed in many colonial cities. The influx of Scottish physicians and those with Scottish education particularly encouraged the growth of science. A popular scientific culture began to emerge, with public lectures and demonstrations and the publication of books on science. Many of the lecturers, like Benjamin Franklin's friend Ebenezer Kinnersley, were showmen, as well as educators.

A powerful motivation for the foundation of colonial scientific institutions was economic development. The French founded a network of botanical gardens in their island colonies of Mauritius, Reunion, Saint-Domingue, and Guadeloupe, hoping to acclimate economically productive crops, as coffee was acclimated in the French Caribbean colonies. France was building on a long tradition of active botanical investigation of the New World, dating back to Samuel Champlain's sending of American plants to Paris in the early seventeenth century. French colonial gardens often employed botanists trained at the Royal Botanical Garden in Paris and reported back to it. Britain lagged behind France botanically, setting up a centralized system only after the American Revolution with the founding of Kew Gardens.

The Spanish also turned to a more aggressive approach to the resources of their empire in the late eighteenth century, sending the Royal Botanical Expedition to Mexico in 1787. The leading scientific center of Spain's American Empire was Mexico City, which received a Royal Botanical Garden in 1788 and a Royal Mining College in 1792.

In the eighteenth century, colonial residents began to be independent voices in Western science. The botanists John Clayton of Virginia and Dr. Alexander Garden of Charles Town (after whom the gardenia is named) were respected correspondents and colleagues of European botanists, not persons principally valued for their collecting ability, like John Bartram.

Colonial scientists also made their presence felt in new fields. One reason for Benjamin Franklin's fame was that he was the first colonial scientist, born and resident in a colony, to make an important original contribution to experimental physics. This led to his acceptance as a peer by Europe's leading scientists. Franklin was fortunate to be working in a relatively young field, where there was not a great deal of previous literature or mathematized theory to master.

The disadvantage of colonial isolation for more theoretically inclined physicists can be seen in the work of Franklin's New York contemporary Cadwallader Colden. Colden's *An Explication of the First Causes of Action in Matter; and the Cause of Gravitation* (1745) showed little awareness of work in mechanics and physics since Newton, and the book was harshly reviewed when it appeared in Europe.

Colonial scientific communities began, by the late eighteenth century, to emphasize their separateness from Europe. The study of local natural history

could contribute to the sense of a separate colonial identity, as could scientific disputes with Europeans. Mexican naturalists attacked the Royal Botanical Expedition's attempt to impose the "European" Linnaean system of classification on Mexican plants.

Particularly important for New World natural historians was defending the Western hemisphere from European scientists like the Comte de Buffon and Cornelius de Pauw, who claimed it inferior to the Eastern hemisphere. Buffon pointed to cases where New World animals were smaller than those of the Old World, as pumas were smaller than lions, to argue that the New World's climate and humidity produced generally inferior fauna. This argument was also given a racist twist, as Native Americans were considered inferior to Old World people, Europeans in particular; some went even further to assert that Europeans inevitably degenerated in the Americas. This aroused the pride of New World scientists. Thomas Jefferson defended the fauna of the New World from the aspersions of Buffon and others in *Notes on the State of Virginia* (1785).

Resentments between colonial and European scientists and the desire to build an independent scientific culture could easily lead to support for political independence. Both Franklin and Jefferson combined support for American independence with contributions to an independent American science.

Scots-Irish

Although there were Scots-Irish in the colonies in small numbers during the seventeenth century, the major influx came in the eighteenth century, beginning in 1718 and lasting into the 1770s. Throughout the period, numbers waxed and waned, depending on conditions in Ireland, but immigration halted only for the American Revolution, 1775 to 1783, and it resumed after the war.

The Scots-Irish are a distinct group from the coincident migrations from Ireland of Anglicans, Quakers, and Catholics. The predominant religion of the Scots-Irish was Presbyterianism. Scots-Irish were those who were born in or lived in Ireland but whose ancestral or personal origins were in Scotland. Other names for the Scots-Irish include the Ulster Scots and Irish Presbyterians. From the first arrivals in 1718 through the end of the century, approximately 250,000 Scots-Irish immigrated to the United States, half the number who came in the nineteenth century.

Background

In the early seventeenth century, Scottish settlers began entering Ulster in the north of Ireland, when King James I gave Catholic land to English and Scottish Protestants in an attempt to control the territory. The migration of the Scots to Ulster continued through the seventeenth and eighteenth centuries.

The Scots planters in the 1630s became increasingly alienated by the Stuart religious policies, when the king established the Church of Ireland as the official church. Although the Presbyterians had tried to adapt their ecclesiastical system to the demands of the Stuart policy, with only moderate success, they found increasingly that the two were incompatible. Furthermore, a strong Scottish evangelical movement concerned them, as did the persecution of the English Puritans, who emigrated in 1620.

When James I died in 1625, Charles I, his son, proved an aggressive defender of his church, imposing new taxes and threatening to take church lands, as well as dealing harshly with the Covenanters, as those Scots who signed the National Covenant to uphold the Presbyterian religion were called. Charles I's behavior led to the English Civil War, and he was beheaded in 1649. The Stuart rule gave way to the Commonwealth of Oliver Cromwell. In 1690, England and France went to war.

Meanwhile, in Ireland, Thomas Wentworth, Earl of Stratford, became lord deputy. New bishops, who were severely anti-Presbyterian, came into office. The locals contacted settlers in Massachusetts and received sufficient encouragement that some attempted to migrate in pursuit of religious freedom. Unfortunately, on this occasion, their ship, the *Eaglewing*, proved unable to withstand stormy weather, so the migration was delayed.

In the seventeenth and eighteenth centuries, Ireland was tumultuous—with rebellion, the Cromwellian Interregnum, and the Battle of the Boyne in 1690, when William of Orange, with French assistance, bested the Catholic James II. Rebellions occurred in 1798 and 1803. Repression, unrest, higher rents, disabilities—the Scots-Irish had ample reason to leave their homeland. And when a congregation's minister led the way, they emigrated.

Although the colonies were strongly anti-Catholic, they held no animosity toward Presbyterians or other nonconformists. These sorts were allowed to enjoy religious freedom and to prosper, as long as they were not too conspicuous in their peculiarities and avoided the strongly religious colonies of New England.

Migration

There were multiple waves of migration from Northern Ireland to America. The high tides were in 1717–1718, 1725–1729, 1740–1741, 1754–1755, and 1771–1775.

The reasons for the large migrations in the eighteenth century included high rents and religious persecution. Most came freely, but there were also indentured servants and deported prisoners. Others arrived with the British army and opted to settle instead of returning. Ministers naturally took the lead in some migrations, collecting their flock from one or more Irish towns or parishes and bringing all to the colonies to cluster together in the new settlement.

The Scots-Irish presence in the colonies began in the seventeenth century, but the first major migration was the group led by Reverend James McGregor in 1718 from County Londonderry to Boston. This group founded Londonderry, New Hampshire. Most Scots-Irish, however, settled in waves from Pennsylvania through Virginia and the Carolinas. Even so, there was a Scots-Irish presence in all thirteen colonies.

The first movement in 1717–1718 opened the path. It came on the heels of drought years, bad crops, and high prices. Also influencing the decision to move was the practice of rack renting. Under this practice, once a lease expired, the landlord would raise the rent and lease to the highest bidder. In the seventeenth century, rents were usually reasonable—supply exceeding demand. In the eighteenth century, as more immigrants came to Ulster and land became scarce, landlords took the upper hand. The rack rents uprooted families that had been on the same lease for a generation, maybe two.

Those who immigrated in 1717 sent back reports to those who would follow. They reported on their cold welcome in Boston and other unanticipated problems. Or they reported from their entry points on the Delaware River that Pennsylvania was the place to be. By 1720, emigration from Ulster to America meant mostly hitting the Delaware ports and moving west. The pattern persisted for fifty-eight years. This was the Great Migration, with a vast majority of immigrants entering at Philadelphia, New Castle, or Chester.

So large that it seemed capable of emptying Ulster of all Protestants, the second wave, that of 1725–1729, caused Parliament to look into the causes of migration. The immigrants cited rack rents as the determinant, but there also was the fact that their lives were wretched: they were living in poverty, without enough food for their families. At the same time, government restrictions on commerce and manufacturing precluded the development of alternatives. Add taxes at relatively exorbitant rates, a scarcity of hard money, and rack rents were the final blow.

Worst of all was the short wave of immigration of 1740–1741. In the former year, famine—not to be confused with the great potato famine that hit Catholic Ireland in the middle years of the decade—struck Ireland. The famine caused the deaths of an estimated 400,000 people and generated a decade of exodus.

Within the colonies, this was the first time that the Scots-Irish moved away from Pennsylvania. Heading southwest through the Great Valley, the new immigrants (and some old) settled the fertile Shenandoah Valley of Virginia, which had a southern opening to North and South Carolina.

The fourth migration took place in 1754–1755. It came about due to another drought in Ulster and strong government propaganda in the colonies. North Carolina enjoyed a succession of aggressive recruiters in the governor's mansion. These governors directed their sales pitches to Ulster and Scotland. Two of them were Ulstermen themselves. All they had to do to sway a drought-stricken Ulsterman was point to the successes of the Scots-Irish in America.

On the down side, this is when the frontier Scots-Irish first encountered the Native Americans. The French and Indian War of 1754–1763 created havoc on the frontier, discouraging not only new immigration but old settlers as well. At the time, Ulster was experiencing an economic recovery so great that the places of the colonial migrants were taken by southern Irish and Scots. Ulster's population exploded, pressing resources and creating the precondition for the next migration, just waiting for the next depression.

By 1770, famine had returned to Ulster, and population pressures had led to the division and subdivision of farms until the plots produced too little to sustain the families living on them. This time, the specific blow was the expiration of the leases on the Antrim estate of the Marquis of Donegal. Rack rents were so extreme as to result in large-scale evictions of long-tenured families. Over the three years that followed, 100 vessels sailed from Northern Ireland, carrying 25,000 to 30,000 Ulster Protestants.

Canadian Settlement

Migrations also occurred between Canada and the other colonies. Farmers who failed owing to bad location moved on. Land was free or cheap.

Farming was a compatible occupation with the Scots-Irish heritage. Some participated in the trade in rum, sugar, and tobacco, matching their occupations to their region. Presumably, at least some held slaves.

In Canada, as in points south, English politics and wars with France influenced migration. In the mid- to late eighteenth century, Canada's speculators

made generous land offerings that proved a strong attraction. Arthur Dobbs attracted migrants to both Canada and the Carolinas. Alexander McNutt had 800,000 acres of Nova Scotia ripe for settlement until the Privy Council, fearing the impact on Ulster's population, placed a five-year moratorium on migration to Nova Scotia. Thomas Desbrisay was noted for making claims for his lands that were, if not fraudulent, extremely close.

Scots-Irish migrants to the Canadian colonies had the problem that much of the settlement was Catholic, the result of the French era. Protestants and Catholics were not exactly the warmest of friends, and Presbyterians were skeptical about moving into Catholic areas. After 1760, the British government actively recruited Protestants into the Catholic areas, but the Revolution halted that effort.

A number of loyalists migrated to Canada during the American War for Independence. Some returned, some did not, and some migrated from eastern Canada to more hospitable places. After the war, migrations into Canada continued from the east and south. By 1791, Canada was home to 80,000 British and twice that number of French. Canada would become Anglicized only during the Napoleonic Wars.

Life in America

In the 1720s and 1730s, many Scots-Irish settled in Pennsylvania. From Pennsylvania, some moved on to Virginia and the Carolinas, and their descendants settled Georgia, Kentucky, and Tennessee in the 1780s and 1790s.

Generally, the Scots-Irish migrated in family groups and settled near other members of their extended families. Immigration may have been simultaneous or separate. Again, some people came with their congregations.

The establishment of the early settlement units provided family links for subsequent migrants. Even though the home situation eased in the early eighteenth century, because harvests were better, rents remained high, tenure was uncertain, and tithes to the state church continued to gall. With encouragement from those who prospered in the colonies, the draw was difficult to resist.

Emigrants in the eighteenth century had no passenger ships; these did not become available until the nineteenth century. Cargo vessels were the only option, and the newly independent United States in 1783 made Ulster a virtually free-trade partner. Increased trade meant increased opportunity for travel.

Indentures before 1770 tended to be younger, single laborers who worked for their passage in dangerous, difficult jobs. They may have sojourned in England for a time, trying to amass the price of passage.

The end of the war altered the type of immigrant, increasing the number of families who came and reducing the level of poverty among the migrants. Eighteenth-century incentives remained strong, as land speculators and governments promised land. Options ranged from South Carolina to Prince Edward Island, Canada.

Once in the colonies, the new immigrants naturally gravitated to New York and the other port cities. They could then take a coastal vessel down to the Carolinas or migrate west.

Scots-Irish tended to migrate to some of the more troubled places in the colonies. They had a strong reputation as tenacious fighters, which made them especially attractive to the Eastern governments in search of a well-defended Western frontier. They also had a strong and deep faith that included a commitment to education (the uneducated could not master the arguments of the Presbyterian religious scholarship and therefore could not understand and participate in their faith). As early as 1716, William Tennent established a log college at Neshaminy, Pennsylvania. And the College of New Jersey, later Princeton, opened in 1746. Scots-Irish eventually moved into the professions, politics, and the presidency.

Throughout the fifty-eight years since the Glorious Revolution, when a Protestant monarchy returned to the throne of Britain, religion had played a role, although not a decisive one. Not coincidentally, while the Church of England and the Catholic churches held onto their members, the Presbyterians headed for the colonies.

All thirteen colonies had Scots-Irish settlers. The principal path—thus, the area most settled by Scots-Irish—was through Pennsylvania, the Valley of Virginia, and the Piedmont of the Carolinas. Presbyterians did settle elsewhere, but many of them were English, Welsh, or Scottish. It should be remembered that by 1717, the Scots and the Scots-Irish were two distinct nationalities, the Scots-Irish having adapted to Irish living over generations.

The Scots did migrate in large numbers during the eighteenth century, matching only 20 to 25 percent of the Scots-Irish total. The Scots had a different history and different path, most coming as criminals or indentured servants prior to the Act of Union in 1707 and as Englishmen seeking to escape from poverty thereafter. Also, they had their troubles, their evictions, enclosure, and the breakup of the clans. The Scots reacted to America differently, too. They avoided fighting the native peoples, frontier trading, and pioneering. They were Eastern-oriented merchants, generally loyalists in the Revolution. Although sharing Presbyterianism and a Scottish heritage, the Scots were not at all the Scots-Irish.

Over time, the Scots-Irish assumed a new character, as did other groups. As the Scots had become Scots-Irish over generations in Ulster, so the Scots-Irish over generations on the frontier, in the backwaters away from the tamer Americans, became Americans themselves. Eventually, some began to lose their Presbyterianism, as they mingled and intermarried with Methodists and Baptists. Still, through it all, they contributed to the settlement of the colonies by taking on the hard jobs in the backwaters—breaking the soil, clearing the wilderness, safeguarding the English, Germans, and Scots in the East.

The Scots-Irish participated in both the French and Indian War and the American Revolution, generally supporting the patriots in opposition to the British Crown. They also fought the Eastern-dominated governments, as in the case of the various mid-eighteenth-century regulator movements. When governments in the eastern parts of the colonies passed hard money requirements for the payments of taxes, skimmed on military protection, and imposed other decisions that harmed their interests, those on the frontier—including the Scots-Irish—protested and rebelled. They also insisted on having a say not just in the colonies' defense, but in their development as well.

The Scots-Irish provided a much-needed barrier between the wilderness to the West and the coast-hugging civilization developing on the Eastern seaboard. Their self-reliance and willingness to fight when necessary also forced a leveling that eventually brought increased democracy to the colonies.

Seminole

The Seminole Indians came into being as the result of a number of historic forces in the eighteenth century. Their history began when groups of native peoples, attempting to relieve the pressure exerted by expanding English plantations, moved into southern Georgia and Alabama and eventually northern Florida.

The Seminole peoples were offshoots of the Creek—or Muskogee—nation, but they did not all speak Muskogee. Many relied on their indigenous languages, while adopting some of the Creeks' cultural practices. Still others remained culturally independent, but historic circumstances made them Seminole as well.

As English plantations and the attendant Native American slavery expanded into Creek territory at the end of the seventeenth century, they uprooted a diverse array of native communities, many of whom formed the basis for the later Seminole tribes. The first Seminoles were Muskogee migrants from the Chattahoochee River region on the border between Georgia and Alabama, though later immigrants came from throughout Creek country and beyond. The "proto-Seminoles" were the survivors of the warfare, disease, and dispossession that accompanied both Spanish and English colonization in the Southeast. Florida had been all but depopulated by the process in the sixteenth and seventeenth centuries. Diverse groups of Yuchis, Alabamas, Tallassees, Yamasees, Hitchitis, and Oconeas came together gradually to form the early modern Seminoles.

The name *Seminole* comes from a Creek word that means "runaway" and has connotations of wildness. As African slaves fled Carolina plantations, many of them ended up in northern Florida, living in autonomous black towns among the region's natives. By 1800, Europeans had taken to calling all of Florida's non-white peoples Seminole.

The Seminole and Muskogee shared many cultural traits, including a matrilineal clan structure, town-based government, and the creation of larger political networks—paramount chiefdoms and confederacies. In their civil government, Seminoles attempted to avoid open disputes and focused on rule by consensus, even if occasionally consensus was a long time in coming.

Seminoles farmed, fished, hunted, and gathered wild plants for food. They also participated in a profitable trade with British companies and individuals operating in the region. Seminoles provided deerskins in exchange for items of European manufacture, including cloth, tools, knives, firearms, and ammunition. Like other tribes, the Seminoles managed to use European products in their own culturally specific ways, but they came to be dependent on traders.

The year 1763 was pivotal for Native Americans in North America. The end of the French and Indian War ensured that Britain and its colonies would dominate affairs in the eastern half of the continent. The Seminole had traded with French, Spanish, and Anglo-American factors, but, increasingly, they were surrounded by British Americans. A decade or so later, the Seminole were again free to trade with both Britain and Spain, as well as the newly created American states of Georgia and South Carolina.

In the American Revolution, many Seminoles sided with the Americans, while the Creeks, more likely to be Muskogees, generally sided with the British. The war also heightened African American immigration to Seminole country, as some slaves used the disruption of the war to strike out for freedom, while others earned their freedom by aiding the military efforts of the British and occasionally the American Revolutionaries. Some black Seminoles reached the highest levels of Seminole society, and their legal status within Seminole towns is hard to ascertain. More acculturated Creeks and Seminoles did own black slaves in the English style.

In the early nineteenth century, though few Seminoles had participated in the Creek Wars, General Andrew Jackson invaded Spanish Florida and burned Seminole towns and the towns of their neighbors of African descent. In the 1820s, facing pressure from the United States—which gained Florida in 1821—some Seminoles began to consider moving to lands west of the Mississippi. Most Seminoles chose to remain in Florida, and the result was the Second Seminole War (1835–1842), which was the longest and costliest of the United States' nineteenth-century Indian Wars.

By the 1840s, most Seminoles lived in Indian Territory, where they re-established their culture and government. Several hundred Seminoles remained in Florida's swamps, and others, under Wildcat and John Horse—the leader of a black town—migrated to northern Mexico.

Seneca

Known as the "Keepers of the Western Door," the Seneca Nation of Indians was the most numerous tribe in the Iroquois Confederacy during the colonial period. One of the original Five Nations, the Seneca played a vital role both in the protection of the Confederacy from outsiders, as well as in controlling the lucrative fur trade between the French and English traders during the colonial period.

Estimates of the Seneca population vary widely. Some historians put the figure at around a couple of thousand in the late 1600s, while others say it was closer to 5,000. Almost all agree, however, that it fell dramatically in subsequent decades, to anywhere between 600 and 2,000 by the end of the American Revolution.

A complex set of factors contributed to this loss in numbers, including but not limited to disease, warfare, and economic strains caused by fluctuations in the fur trade. Although the Seneca had the largest population of all the Iroquois, they had the fewest number of council chiefs (known as sachems). Yet no one tribe dominated the council, as council chiefs had to vote as a unanimous group in order to be heard. As the Keepers of the Western Door, two of the Seneca sachems were responsible for alerting the Confederacy to possible threats from neighboring tribes, as well as informing the council as to the status of the several tributary tribes of the Iroquois.

The tribe consisted of eight clans, or families, to which each member claimed affiliation. Senecas were members of the Bear, Turtle, Wolf, Beaver, Snipe, Hawk, Heron, and Deer clans. Clans rotated membership in the councils, and each council member would assume the name of the predecessor from his clan. Handsome Lake (Skanyariogh), for example, was the name of the council member of the Turtle Clan.

The Seneca occupied most of what is now the western portion of New York, residing in villages in parts of Livingston, Ontario, and Monroe Counties. Yet the main concentration of Seneca villages was split into two groups, the eastern and western tribes, a division that existed before the formation of the Iroquois Confederacy. These villages were moved every ten to twenty years, for both economic and environmental reasons.

While the Seneca encountered immigrants from many parts of Europe during the colonial period, missionaries and fur traders dominated the bulk of the interactions between the tribe and whites. As the westernmost tribe of the Iroquois and because of their experience and expertise in trapping furs, the Seneca consolidated their hold over the fur trade in western New York. Thus, the tribe dealt heavily with French, Dutch, and, later, English traders. The Dutch presence in western New York was limited, however, and, by the early sixteenth century, the French were the primary European buyers of beaver pelts and other furs.

The Seneca chief Red Jacket, or Sagoyewatha, earned his English name for wearing the British uniform during the American Revolution. He later made peace with the new U.S. government. (Library of Congress, LC-USZ62-128675)

Relations between the French and the Seneca were not always amicable, as the tendency of French merchants to trade with neighboring tributary tribes strained relations, leading to war between the French and the Seneca in 1686. The French were victorious in this encounter, enabling them to secure their hold as the major trading partner of the Seneca. This alliance would last throughout the French and Indian War.

While several missionaries attempted to establish a foothold in Seneca villages, their efforts during the sixteenth and seventeenth centuries were largely ineffectual and short-lived. The Seneca resisted most attempts by Jesuit missionaries to gain converts among the tribe. In 1688, the Jesuits formed their first permanent mission in the area, yet relatively few Native Americans were willing to convert.

During the early part of the eighteenth century, English traders began to have an increased presence in the Seneca fur trade. The Seneca proved adept at balancing the trade between both French and English interests, remaining powerfully neutral during most disputes between the two. Yet the outbreak of the French and Indian War in North America all but forced the Senecas to choose sides. Primarily because of their long-standing ties with the French, many of the Seneca warriors fought alongside French troops in their campaigns against the British.

With British victory came changes in the nature of trade. The free trade that had existed prior to the outbreak of war was now controlled through British outposts, where English garrisons could regulate the flow of goods. Although the Seneca were not pleased with this new arrangement, as their participation in Pontiac's Rebellion shows, English promises to keep land-hungry settlers off the natives' land were welcomed by the tribe. Yet in the years preceding the American Revolution, English settlers continued to ignore the treaties between the Seneca and the English that forbade them to encroach on Iroquois land.

When the war began, the whole of the Iroquois Confederacy chose to remain neutral. As the war raged on, however, the Iroquois began to see more and more battles fought near or on their settlements. Convinced that the Revolutionary soldiers were the same men who desired their lands, the Seneca sided with the British; this alliance proved disastrous to the Seneca after the war.

Although the Seneca had never actually been defeated in battle, the newly formed United States government viewed them as a defeated people. This status put the Seneca at a disadvantage in negotiating later treaties, whereby they tried to hold onto what little land they had left.

Sermons

As early as 1630, John Winthrop wrote *City Upon a Hill*, which portrayed the role of religion in everyday colonial life. "Therefore lett us choose life, that wee, and our Seede, may live; by obeyeing his voyce, and cleaveing to him, for hee is our life, and our prosperity." The phrase "city upon a hill" was used to describe the new settlement, with "the eies (eyes) of all people" upon them as they forged a new life in a new land.

With such words, the Pilgrims and Puritans laid a foundation for their new world. Since their principal spokesmen were ministers, emphasis was placed upon not only themselves and their religion, but also their role in a new destiny for the New World. What they wanted to do was to create for themselves and their descendants a heaven on earth, a community in which they could worship and live in a way they believed to be correct, without any interference. The Bible would then be cited as the sole authority for law and everyday life, and anyone who dared to disagree with its doctrine, or presented different ideas, would be promptly banned (examples included Roger Williams and Anne Hutchinson) or worse.

Because drama and novels were viewed as evil diversions, the printed works of the period were religious in nature. It is not surprising, then, that sermons and various theological works remained the most prevalent form of writing. The most prolific writer of all was Cotton Mather, who published approximately 450 books and pamphlets, all based on his religious beliefs and various sermons.

Another early minister and writer was Jonathan Edwards, who is famous for his frightening, powerful sermon, "Sinners in the Hands of an Angry God." Edwards's rigid Puritan experience and the strong Calvinist beliefs of many, coupled with his sense of duty, placed him in a situation where he had to defend the strict and gloomy new force of Calvinism from the forces of liberalism that were beginning to spring up around him.

If God should let you go, you would immediately sink, and sinfully descend, and plunge into the bottomless gulf.... The God that holds you over the pit of hell, much as one holds a spider or some loathsome insect over the fire, abhors you, and is dreadfully provoked.... he looks upon you as worthy of nothing else but to be cast into the bottomless gulf.

Such sermons as these had an enormous emotional impact, enough to send entire congregations into hysterical fits of weeping and expressing bitter remorse. After a period of time, such rigid and bitter denunciations of people who had sinned alienated some from the very source of Calvinism that Edwards was attempting to defend.

Early ministers were totally committed to the salvation of their listeners, and this is the primary theme throughout all of their messages. Furthermore, there is a strong consistency in these sermons that effectively links the ministers of the early 1600s with those of the later 1770s. For instance, there are very few true doctrinal differences between the great ministers such as John Cotton and Jonathan Edwards. Their sermons were a primary force in creating a cohesive culture that moved toward self-identity and independence. Those sermons reflect the piety and passions of a people whose culture would ultimately form the fertile soil for creation of the American nation.

Although the core of their sermons remained consistent, changes made over time reflected an adjustment to a changing environment. The principal themes remained at all times those of personal piety and liberty. These themes are linked by a shared sense of cultural and religious destiny, the "city set on a hill" mission, in which New England would fulfill the goal of Calvin's Geneva to create the perfect society so that the Kingdom of God might be fully realized on earth.

The New England preacher, more than the statesman or soldier, was the preeminent power in the colonial period. His sermon was both religious and political, reflecting a conceptual marriage of church and state. There were multiple connections between religious and political thinking in early American life, and the sermon played a pivotal role in the development of that life.

The sermon was also an excellent educational experience. Sunday morning might be a time to hear the latest news or see old friends and neighbors, but it was also an opportunity for many to sit under a man of God who had spent many hours preparing for a two-, three-, or even a four-hour sermon. Many a colonial pastor, such as Jonathan Edwards, spent eight to twelve hours daily studying, praying over, and researching his sermon. Colonial sermons were filled with the fruits of years of study and were designed to appeal not only to the emotions and will, but also to the intellect.

As Daniel Boorstin has noted, the sermon was one of the chief literary forms in colonial America. Realizing this, listeners followed sermons closely and would often discuss them later with family and fellow congregants. Thus, without ever attending a college or seminary, a churchgoer in colonial America could gain an intimate knowledge of biblical doctrine, church history, and classical literature. Often, a sermon was later published, and listeners could review what they had heard previously.

Serra, Fray Junípero (1713–1784)

Fray (Father) Junípero Serra established more than twenty Franciscan missions in California in the late eighteenth century. His legacy is a complex one of missionary work, personal conviction, courage, violence, and the destruction of the cultures of California's native peoples.

While Pope John Paul II beatified Serra in 1987, many native Californians oppose Serra's progression toward sainthood, citing his record of cruelty to their forebears. Others, including academics, have criticized the beatification as well. Serra's supporters claim he was simply a man of his times.

Junípero Serra was born on Mallorca, a Spanish island in the Mediterranean, in 1713. Though not wealthy, he attended religious schools and displayed an aptitude for the life of the mind. While still in his teens, he was ordained as a priest. From the late 1730s to 1749, Serra was a professor of philosophy. He gave up a prestigious academic post to seek converts and a martyr's death in the Americas.

The Spanish missionary Fray Junípero Serra has been called the Apostle of California for his work there in the late 1700s, including the founding of twenty-one Franciscan missions. He was beatified in 1987. (Courtesy of University of Southern California, on behalf of the USC Specialized Libraries and Archival Collections)

Serra's arrival in Mexico was remarkable for the fact that he insisted on walking from the port at Vera Cruz to Mexico City. In the 1750s, Serra worked at various jobs in and around the colonial capital. The expulsion of the Jesuits in 1767, and especially their arrest and removal from Baja California, landed the Franciscan Serra an appointment as head of the new missions. Serra managed the religious aspects of the colonization of Alta California (the present-state of California), while Captain Gaspar de Portolá attended to more secular and military matters.

Even in the late eighteenth century, Europeans had little understanding of the geography of the interior of North America. As such, England, Spain, Holland, and Russia all maintained claims to the continent's Pacific coast. Of these nations, Russia posed the most immediate and serious threat to Spanish expansion in the region. In the late 1760s, Serra's Franciscans and Portolá's soldiers and sailors struck out to the north in an effort to gain native

converts and stop Russian encroachment.

Serra was legendary for his cruelty, not only to native people, but also to himself. He believed in a severe form of Christianity: he wore coarse shirts with bits of metal that irritated his skin, flogged himself until he drew blood, burned himself with a candle, and insisted on walking everywhere, aggravating his ulcerous legs. As if these self-inflicted punishments were not enough, Serra also suffered from asthma and generally poor health.

Serra, like other Spanish colonizers before him, failed to grasp the subtleties of native culture, especially concerning the importance of gifts and reciprocity. Serra insisted on intimidating native people to bring them into line with the new mission order. He relied on heavy-handed tactics such as whippings, burnings, and executions to achieve his goals. In 1775, some Ipais repaid Serra's cruelty by killing their priest at San Diego and burning the mission. Other native communities followed suit.

The second half of the eighteenth century witnessed a conflict between secular and religious forces over which group would control Spanish colonization. At the time, Spain was engaged in a massive overhaul of its colonial empire, known as the Bourbon reforms. California, which was becoming a financial liability, was an experiment in a new form of colonization that combined Spanish settlements with missions and native communities. (Earlier efforts generally segregated the Spanish and Native Americans.)

In the late eighteenth century, California was a densely populated region, but concentrating native people in missions intensified the effects of European diseases, and the native population dropped precipitously. Missions were supposed to take on a smaller role in the process of colonization, but they became the defining feature of the developing society. They were intended (misguided as it sounds now) to help native peoples, but ended up with disastrous effects. Their bringing natives together in large numbers and exposing them to European diseases led to epidemics that killed many of these native peoples.

While these calamities cannot be blamed on the rigid policies of Junípero Serra, he molded the missions of California—including San Diego, San Gabriel, San Juan Capistrano, San José, San Francisco, San Luis Obispo, and Monterey. By the time of his death in 1784, Serra had overseen the founding of several important missions that accounted for nearly all cattle and grain production in California and boasted a native population of just less than 5,000.

Servants, Domestic

“Domestic servants” are those who do most of their work in the home. Domestic help throughout the colonial period came predominantly from three sources: contracted indentured servants, redemptioners, and African slave labor, which had been introduced to the American colonies by the early decades of the seventeenth century.

Indentured servants offered their services to a master in exchange for passage to America, and sometimes convicts (or vagrants) from England were “sentenced” to do service in America. An indentured contract was a written agreement between the servant and the master. The servant would sign on, usually for a term between four and seven years, and work for the master for that period of time. On completion of the contract, servants became “free” and received clothing and usually a sum of money (“freedom dues”) or other means to make a start for themselves. Approximately one-half to two-thirds of white immigrants coming to colonial America were indentured servants.

The redemptioners were individuals who had no pre-established contract prior to arriving in America; they usually paid a portion of their own passage. Redemptioners were given a certain amount of time, once arriving in America, to establish a contract before they were “sold” to the highest bidder to pay for the remainder of their passage. If the redemptioner was able to make a contract, it was usually less than that of an indentured servant, because it was based on the remaining amount of money owed.

The third group bound to servitude was the slaves. Although slaves predominantly worked in the fields, house slaves operated as domestic help. Slavery was drastically different than indentured (or contracted) servitude. Unlike indentured servants, whose term of contract was set, the law bound slaves to an owner for life and required the slave to work at whatever task was ordered.

From the early eighteenth century until well into the nineteenth century, hundreds of thousands of Irish immigrants in America took work as domestic servants. (National Park Service Statue of Liberty National Monument)

Domestic servants, both indentured and slaves, were found in all thirteen colonies throughout the colonial period. When the number of indentured servants declined in the late seventeenth century, colonial households relied on slave labor and paid domestic help. Following the American Revolution, the slave labor system became more common in the South, and the free labor system became the norm in the North. For example, domestic service was a position readily available to free black women in Northern states.

Women as Domestic Servants

Domestic service work has traditionally been a female occupation, because it is work done in the home. In the colonial period, the only substantial group of women wage earners worked as domestic servants; the majority of them were unmarried or widowed women. Domestic servants were often women who worked in temporary situations during hard times. Domestic service positions required little training and little capital investment, making them suitable situations for those who were unable to pursue more lucrative work. Because the apprenticeship system was essentially closed to women, domestic service became one of their only means of gainful employment.

Young girls also worked as domestic servants, and female domestic servants usually remained in service until they married and established their own households. Because there was a fear of idleness in colonial America (as also in England), children as young as 8 and usually from the poorest class were sometimes "bound out" as servants to learn the lessons of industrious and useful labor. Children's contracts usually required that they work until the age of majority, and many guaranteed some provision for schooling.

Wages and compensation for domestic servants varied throughout the thirteen colonies. Indentured servants were usually compensated only by their passage to America, room and board for their term of service, and a small sum of money and suit of clothing after the completion of the contract. In some cases, an indentured servant might receive additional wages while serving out the contract, but this was rare. Wages for free laborers who worked as domestic servants were normally only basic subsistence, but they did receive room and board while employed. House slaves received no wages.

Laws and Domestic Servants

There were few laws in colonial America that dealt specifically with domestic servants; rather, there were general laws dealing with servants of all types. Labor legislation existed in all thirteen colonies and had a twofold purpose.

On the one hand, laws protected the servant from cruelty by the master. For example, servants' contracts that bound them in a particular colony could not be sold out of that colony without the servant's consent. Masters were required to provide adequate food, clothing, and lodging for their servants and to care for their servants when they became ill. The law also protected servants from cruelty, especially bodily maiming (although servants could be disciplined). Servants could sue in court for violations of the law and, if victorious, could have their contracts terminated and thus become free.

On the other hand, laws protected the master's capital investment in the servant. The law guaranteed a master's right to retrieve servants if they ran away. In some cases, additional time was added to the original contract when the servant returned. There were stiff penalties (ranging from fines to beatings) for anyone harboring a runaway servant, and incentives (usually monetary) were given to individuals who assisted in the return of runaways. In addition, there were special laws for female servants. They were barred from marrying without the permission of the master, and those who became pregnant faced additional time added to their contracts.

Slaves faced the strictest penalties under the law, because they were considered property and thus had virtually no legal rights. The laws against runaway slaves were the strictest. Many colonies made provisions under the law to return fugitive slaves to their owners, often with a monetary reward to the person assisting in the return. Slaves found without a written pass were suspected of being fugitives and returned promptly to their owners. Punishment for running away was usually harsh. Unlike indentured servants, slaves could not sue in court and were not protected under the law.

Life as a domestic servant was hard. The colonial household was a place of production, meaning that all subsistence products used in the home were made in the home. This was different from the situation in the industrialized household, where many necessary items were produced in factories and

bought in stores.

Servants' main responsibilities were cooking and cleaning, both arduous tasks. With no indoor plumbing, servants had to carry in buckets of water to cook and clean. Ashes from a wood-burning stove kept the servant constantly busy trying to keep the home clean.

Servants were also responsible for tasks such as sewing, weaving, spinning, knitting, tailoring, preserving food, and gardening. They made such household items as soap, candles, medicines, and cheese. In addition, domestic servants were not confined to household tasks. They also worked in the fields to produce subsistence crops for the household.

The servant fell under the discipline of the master and mistress of the house. For example, in Puritan New England, parents were encouraged to discipline not only their children but also their servants in order to maintain a moral family structure for all who lived in the household.

Social Status of Domestic Servants

Domestic servants also fell low in the hierarchy of status. Domestic work was considered unskilled labor, because it required little formal training. It also did not require the period of apprenticeship that accompanied the skilled craft positions usually reserved for males. Within the household, servants knew that their place was below the master, mistress, and children. Colonists brought this view with them from England and used it to legitimize the low social status of servants in America.

The existence of slavery in the American colonies also contributed to the stigma of servitude. Although there was a distinct difference between servant and slave (especially concerning the law), slavery was generally associated with any type of servitude.

Immigration had a similar effect. By the 1710s, German and Irish immigrants began coming to America. Many of the newly arriving immigrants became domestic servants, a trend that continued well into the nineteenth century. The negative attitude toward immigrants in general reinforced the stigma of domestic work.

Also contributing to this negative image were continuing problems between masters and servants. Routinely, servants complained of ill treatment and hard work, and masters complained of ungrateful and inefficient servants. In many cases, both were correct.

With the beginning of the factory system in the late eighteenth century, new opportunities for wage work were opened to women. Skills such as sewing, spinning, and weaving became important to the textile factories. In addition to taking jobs in the factories, women began using their domestic skills to do piecework in their own homes. Even with the new opportunities, domestic service work continued to be the largest employer of women and girls throughout the nineteenth and early twentieth centuries. Increasing immigration in the mid-nineteenth century introduced a new group of single and poor women from Ireland and Germany who would become domestic servants. These positions continued to be associated with unskilled labor and to carry the stigma of hard work, low pay, and dissatisfaction.

Sex

Sex played a significant role in the fabric of colonial society. Contrary to popular images, early Americans were a lusty lot. Puritans, falsely portrayed as the most sexually repressed of Americans, celebrated sexuality within the confines of marriage. Other groups, notably early Southerners and African Americans, sometimes observed fluid definitions of marriage and engaged in premarital sex and serial monogamy. Meanwhile, colonial courts prosecuted a number of cases of what were deemed sexual transgressions.

To the Puritans, marriage only officially took place after a church ceremony, and sex only took place within marriage. They wholeheartedly promoted active sex lives between husbands and wives, both to populate New England and to discourage illicit, nonmarital unions. Ministers hoped that a strong sexual marital relationship would remove the temptation of adultery.

Sex was so essential in the lives of Puritans that a wife could divorce her husband for failing to satisfy her sexually. New England courts held that a woman had a right to expect sexual satisfaction in bed and that a man who failed to provide such contentment had failed as a husband. Marital sexuality did have limits, though. Puritan teachings warned that marital sex could become illicit if a husband and wife allowed their desire for each other to surpass

their love of God.

The first generation of Puritan settlers only engaged in debates over sexuality with nonbelieving outsiders, who occasionally chose to shock their devout neighbors with public displays of lewdness. As time passed, however, the sons and daughters of the original settlers developed different ideas about marriage.

Additionally, long-standing popular traditions condoned premarital sex, and these beliefs proved stronger than official dogma in shaping sexuality. Many couples dated the start of their marriages to the time of their commitment to one another and engaged in sexual relations in the belief that they were doing so within the marital bond. The Puritan fathers disagreed.

Scores of women, including those holding church membership, were prosecuted in seventeenth century New England courts for bearing children outside of wedlock. At the same time, more and more New Englanders were appearing before church congregations and in court, charged with lewd speech, fornication, adultery, bigamy, rape, incest, sodomy, and bestiality. Many of these people were caught in the act, because Puritans believed that they had a right to keep a sharp eye on the activities of their neighbors in order to guarantee that everyone behaved in a proper manner.

The distance between settlements in colonial America and the distance between the New World and the Old made it easy for some to begin extramarital relationships without detection. Colonists were notoriously lax in following the legal requirement that one marriage be dissolved before entering into a new one. Additionally, the requirements for official separation were difficult. The simple declaration that a marriage had failed would not dissolve it. If one spouse claimed adultery, the guilty parties would suffer public condemnation, as well as physical punishment.

In the Southern colonies, sexuality was much less restricted for a number of reasons. The ratio of men and women was severely skewed, and women were in short supply. Restricting sexuality only to marriage deprived most young men in the South of any access to a legal sexual relationship. However, unmarried indentured servants who engaged in sexual relations could find themselves charged in court as economic and moral liabilities. Pregnancy left a servant unable to perform her duties and therefore deprived her master of labor that he had purchased.

Marriage in the South also proved difficult to achieve, because many communities lacked both clerics and established governments. Unlike colonists in the North, some couples in these circumstances entered into relationships that were recognized as legitimate marriages by their peers.

For African Americans, sexuality often involved continuing African patterns of serial monogamy or polygamy. Whites interpreted such behavior as being rooted in an animalistic and depraved nature. The depiction of blacks as incapable of sexual loyalty was further reinforced by the practice of separating husbands and wives in slave sales.

The refusal to recognize the humanity of blacks, combined with a notion of white male privilege, also contributed to the widespread rape of slave women by masters and overseers. Masters had no legal requirement to recognize slave marriages, and many did not do so.

Shakers

A Protestant communal sect that came to America from Great Britain in 1774, the Shakers experienced considerable persecution for their unusual beliefs. Under the guidance of Mother Ann Lee, the congregation (also known as the United Society of Believers in Christ's Second Appearing) shocked their neighbors in upstate New York by advocating celibacy, practicing pacifism, and allowing women to share leadership duties.

The Shakers began in Manchester, England, in 1746 as a splinter group from a Quaker community. Known as the "Shaking Quakers" for the tremors that members experienced during worship, the group soon became the target of considerable harassment for their radical beliefs and their acceptance of Ann Lee, a woman, as their leader, which proved especially troubling to laypeople and authorities alike.

Ann Lee had sought comfort among the Shakers after the deaths of all her children, and she became convinced that God had claimed her offspring as punishment for engaging in the sin of sex, the same act that had resulted in the banishment of Adam and Eve. Consequently, Lee viewed marriage as the root of all evil, and she promoted celibacy as a means of growing closer to God. Sexual intercourse was solely given to humans for reproduction, Lee argued, and the inability to use it only for this purpose had made us base and animal-like.

While imprisoned for attacking the established Church of England, Lee had experienced a revelation that led the Shakers to believe that she was the second coming of Christ, the vital female component of God the Father-Mother. About 1772, she became the official leader of the small congregation.

As persecution of the Shakers increased, a small group composed of Lee, her brother, niece, and husband, and five others followed her vision of a holy sanctuary in the New World to New York City in May 1774. The group worked at odd jobs before relocating in late 1776 to an area northwest of Albany known as Niskeyuna (subsequently named Watervliet).

The views of the Shakers were so unusual that they met with considerable harassment in the New World as well. They held services in an open space with an altar in the middle so that ecstatic experiences and dancing could become a part of the worship service. Such excessive behavior was frowned upon by other Christian denominations and played a not inconsiderable role in establishing the Shakers' radical reputation.

Perhaps most controversially, the Shakers held to an ideal of gender equality based on their belief that God incorporates both masculine and feminine characteristics. The congregation created parallel male and female leadership positions in an attempt to live as close to God's ideal as possible. Pairs of trustees governed temporal concerns, including the sales and purchase of goods, legal disputes, and other interactions with the outside world. Deacons and deaconesses oversaw specific tasks such as kitchen work and industries, such as farming or the production of medicinal products. While the positions rotated among the membership, the Shakers still divided along traditional gender lines to complete work-related tasks.

The Shakers sought to create a truly selfless and spiritual society. They emphasized simplicity in dress and lifestyle, creating a style of furniture in the process that became an American classic. They also suppressed individuality and created communal alternatives to the family system. All property was shared, and biological kinship relations were abandoned in favor of a village-wide family of brothers and sisters. Preferring first-person religious experiences, they did not rely heavily on written doctrines, although they did draw guidance from the Bible and the personal writings of Lee.

Horrified and angered by the strange newcomers, other residents of New York persecuted and physically attacked many of the Shakers, including Lee, for being radical, English, and pacifistic. The leaders of Albany, all patriots quick to discriminate on the basis of religion, demanded that the Shakers swear loyalty to America. Uninterested in patriotism or politics, Lee forbade her followers to fight anyone for any cause. As followers in Christ's footsteps, Lee proclaimed, the Shakers would never aid or abet the sins of war and bloodshed.

The survival of the congregation remained in considerable doubt until a wave of religious revivalism called the New Light Stir swept across New England between 1776 and 1783, bringing in new converts from other radical groups and allowing the Shakers to proselytize safely. The little village in New York soon swelled with new recruits.

The first community of Shakers in America was founded in 1776 by "Mother" Ann Lee in an area northwest of Albany, New York, known as Niskeyuna (later renamed Watervliet). (Brown Brothers, Sterling, Pennsylvania)

The Shakers emerged as one of America's most durable and successful communal experiments by virtue of their longevity, with 6,000 members in 19 communities at their peak between 1830 and 1840. As interest in utopian social movements faded, the Shakers declined significantly. By the end of the twentieth century, only a handful of members remained in the two last surviving settlements.

Ship's Stores

The term “ship's stores,” or “naval stores” as they were commonly known during the colonial era, included a number of materials used in the construction and maintenance of wooden ships. As such, naval stores included, but were not limited to, tar, pitch, rosin and hemp, turpentine, masts and ship timbers, potash, pearlash, lime, and iron. Since European navies were made up entirely of wooden vessels until the late nineteenth century, naval stores were important materials in both Europe and the American colonies. Because of the importance of naval vessels to the economic, political, and military salience of the European powers, their need to build and maintain navies created an insatiable demand for naval materials.

Europe was not devoid of the resources needed to produce naval stores, but after hundreds of years of use, the supply of those materials had become limited or required trade with other nations. Although the Baltic and eastern Slavic states were main European sources for naval stores, trade in these supplies was almost entirely monopolized by the Crown of Sweden. Taking advantage of their monopoly, the Swedes forced many European nations to trade under disadvantageous conditions, such as the transport of naval materials only by Swedish or Dutch ships and the setting of exorbitant prices.

When wars erupted, supplies of naval stores often became uncertain, and safe reliable transport was nearly impossible. The customary practice of mercantilism compounded the situation. The Swedes generally requested currency in exchange for their naval stores, which put those who traded with them in opposition to the mercantile system, since they needed to sustain and expand their currency supplies in order to maintain a strong nation.

Therefore, a desire to procure reliable and inexpensive resources for the production of naval stores outside of Europe was among the major reasons that England (as well as other European powers, for that matter) became interested in colonizing North America. With abundant supplies and uncertain ownership claims, North America offered numerous opportunities for European nations to avoid dependence on the Swedish naval stores monopoly. Not surprisingly, then, these materials were among the first marketable commodities that the colonists sent back to Europe.

Unlike other industrial activities, the production of naval stores required little more than the ownership of land possessing an abundance of resources and a labor force to procure the materials. Colonial America had an abundant supply of natural resources, but labor was always in short supply.

While every European nation involved in the settlement of America promoted the production of naval stores, successful production became widespread only in the English colonies. The main reason for this was the commitment of the British government, through its Board of Trade, to promote this commerce. On numerous occasions during the colonial era, the Board of Trade sent orders and directives to the colonial governors to build naval stores production facilities and to limit lumbering activities that were not in support of industries producing naval stores. Since the many colonial governments could not build such facilities and the policing of lumbering was nearly impossible, the Board of Trade pushed legislation in Parliament and the colonial assemblies that allowed for the issuance of bounties and other subsidies to promote construction and operation by private interests.

While these practices were useful, labor shortages within the colonies still set limits. To remedy the labor problem, the British government supplemented the emigration of workers from the Palatine States to special settlements, such as Newburgh (New York), New Bern (North Carolina), the Schoharie Valley (New Jersey), and the Great Valley (Pennsylvania), which were originally set up exclusively for naval stores production.

Sint Eustatius

Commonly known as Statia, Sint Eustatius is a tiny island of just over 8 square miles located at the southern end of the Dutch Windward Islands in the central Caribbean. Volcanic in origin, the saddle-shaped island has a small agricultural valley in the center bounded by cliffs to east and west and hills to the north and south. The soil is thin and standing water nonexistent, while the relative dryness of the savannah climate was exaggerated early on by the effects of deforestation.

Statia has only one town, Oranjestad, divided into a residential Upper Town on the cliff top and the commercial Lower Town along the beach. Despite its small size, Oranjestad was one of the foremost trading centers in the eighteenth-century Atlantic world, dealing in tropical produce, European goods, and African slaves. Undiscriminating multinational trade created political tension in a mercantilist age, however, and Statia changed hands twenty-two times between 1636 and 1816, as France and England tried either to control or to shut down this prosperous Dutch trading hub.

While there is evidence of prehistoric settlement on Statia 1,200 years ago, the island was uninhabited when it first was sighted by the Spanish in about 1493. Small, dry, and without a native labor source, Statia held little interest for the Spanish. The first European venture occurred in 1629, when a French expedition tried and failed to establish a permanent colony on Statia. Like the French, the Dutch were looking for footholds in the Caribbean, and, in 1636, the Dutch West India Company established a small, fortified settlement intended to provide agricultural products for the European market. Statia was particularly valued for its defensible size and its location close to two Dutch islands, just over 2 miles from England's St. Kitts and Nevis and close to the French sugar islands with which Statia eventually conducted most of its trade.

Statia began as a tobacco colony, but, by mid-century, Stadians had expanded plantation production to include sugar and then cotton, coffee, ginger, and indigo. In 1662 there were 1,174 inhabitants (71 percent of whom were slaves), a figure that increased again by half by 1741. As well as shipping its own produce, Statia increasingly traded in the products of neighboring islands, often illegally, and began to refine muscavado sugar from other islands.

Bolstered by very low customs duties, and as Statia's soil fertility declined, multinational commerce by the eighteenth century had surpassed local agriculture in importance. Sheltered but without a good harbor, Lower Town lacked conventional wharfs, and most goods were offloaded at anchor onto small boats and brought to the beach. This labor occupied the island's slave majority, who were less necessary for the dwindling plantations. By the 1770s, nearly six hundred warehouses lined the beach, and a remarkable average of 2,700 ships came to the port yearly, peaking at 3,551 ships in 1779. Business was so brisk that goods were piled in the open outside the full storerooms, and Statia was known as the Golden Rock, the busy town being described as a great fair.

The community that formed in Statia consisted of a stable core of prosperous long-term residents and their slaves, who were increasingly living alongside a more mobile immigrant population. The profits Statia generated by the 1730s brought a multinational group of merchants (usually unmarried) from some two dozen countries and colonies; these newcomers facilitated the existing international illicit trade. The diversity of the island's population was remarkable, including Jewish, Anglican, Catholic, and Lutheran communities alongside the Dutch and trading in goods from all over the globe. Increasingly, Stadian merchants and ships traded with the mainland American colonies, becoming their principal supplier of tea by 1770 and a steady supplier of gunpowder. It was from Statia that the United States received the first foreign salute to its flag on November 16, 1776.

After 1776, Statia's continued illicit trade in armaments to America touched off Britain's anger with the Dutch and with English merchants trading with the rebel colonies through Statia. By 1775, Britain had vessels stationed off Holland's coast to intercept Stadian trade, while British privateers stopped Dutch vessels in the Caribbean from 1777.

To prevent Holland from joining the League of Armed Neutrality, which would have given the Dutch powerful allies in its defense of neutral countries' rights in wartime trade, Britain declared war on Holland in December 1780. Immediately a squadron under Admiral Sir George Rodney sailed for Statia, seizing the island on February 3, 1781. Rodney captured vast amounts of goods, sent away English merchants operating there, and deported one-third of the Jewish merchants. The loss of trade for the Dutch was substantial, but much of the material auctioned off by Rodney was bought back by its former owners, and trade briskly resumed in the 1790s.

By the 1820s, however, American commerce had altered patterns of Caribbean trade to the exclusion of Statia. The little island rapidly fell into the economic decline in which it remains.

Slave Communities and Culture

From the early seventeenth century to the American Revolution, African American slaves innovatively created new communities and cultures by combining the common elements of their African traditions with new influences from white colonial society. By doing so, they found a measure of dignity, assertiveness, and independence in the midst of oppression.

Regions

Slavery in the colonies can be broadly divided by four geographic regions: the New England colonies of Connecticut, Massachusetts, New Hampshire, and Rhode Island; the Middle colonies of Delaware, New Jersey, New York, and Pennsylvania; the Chesapeake colonies of Maryland, North Carolina, and Virginia; and the low country of Georgia and South Carolina. Although slavery was legally practiced everywhere, it varied in extent from region to region.

The economy of the North was largely based on commercial trade and small-scale agriculture, although slave labor still played a significant role. In urban centers like New York, Providence, and Boston, slaves worked as domestic servants and artisans and in maritime industries. Their numbers increased throughout the colonial period at a steady, if not spectacular, rate. By the end of the eighteenth century, African American slaves comprised nearly 20 percent of the population of New York City.

Slaves also lived on the farms of Long Island, New Jersey, and Delaware, tending stock and raising corn and wheat; many had done the same work in Africa and were brought to the colonies for that reason. Throughout the rural North, the majority of slaves lived in groups of no more than two or three families and represented only a small percentage of the population. Even the largest Northern estates had no more than sixty or seventy slaves, at most, one-third the number found on the major plantations of the South. By the 1750s, slaves represented less than 10 percent of the North's overall population; it was in the South that this population would experience its greatest growth.

Slavery in the Chesapeake and low country colonies began with a few Africans helping to clear the land for permanent settlements. Once this frontier period ended, however, the institution of slavery virtually exploded. Southern economies were based on the cash crops of tobacco, wheat, corn, rice, indigo, beef, timber, and naval stores, all of which required large numbers of slaves. Other slaves labored as artisans, domestic servants, boatmen, teamsters, and dock workers. Indeed, just about any labor-intensive job that needed to be done in the Southern colonies was done by African American slaves.

The slave population growth was so massive that blacks outnumbered whites in many counties, as well as in the colonies of South Carolina and Georgia. The greatest number, however, were in Virginia, where the slave population grew from a few dozen in 1625 to nearly 12,000 by the turn of the century. The Chesapeake also had a large white population, however, so slaves remained a demographic and cultural minority. Although each individual plantation was predominantly black—most had between ten and twenty slaves—cultural contact and exchange between the races (including Native Americans) was still common. White society was a constant, if not always welcome, force in the slaves' lives.

By contrast, the low country's high mortality rates (caused by the harshness of the environment, rampant disease, and the hard labor involved in rice production), even higher importation rates, and a small white population meant that most slaves there had only occasional contact with white society. Although the Atlantic slave trade slowed after the 1739 uprising known as the Stono Rebellion, blacks remained in the majority. These slave laborers were generally left alone on the plantations with only a few trusted white overseers, while the slaveholders themselves lived in healthier climates.

Slave culture in the low country therefore retained a stronger African flavor than anywhere else in the colonies. Only in the multiethnic city of Charles Town did slaves become intimately familiar with white society. Even there, the large black population fostered the existence of a distinct, independent slave culture.

The creation of this distinct culture actually began on the other side of the Atlantic, centuries before North America was colonized. In economic centers such as Timbuktu and Dakar, trade was facilitated by the use of Arabic and *lingua francas*, dialects based on the structural similarities of West African languages and eventually including European linguistic elements introduced by traders on the Atlantic coast. This process continued, albeit under much harsher circumstances, when African slavery was introduced to North America in 1619.

The slaves came from a variety of regions, including Ghana, Senegambia, the Congo, and the British West Indies, and were compelled to forge new communities based on racial identity rather than ethnicity. Yet it was their American-born children who ultimately did the most to create new cultures from the traditions of the past and the realities of the present. The labor and living conditions of slave communities, although brutal, were still healthy enough that their numbers grew primarily through childbirth rather than the slave trade. By the time of the American Revolution, foreign-born slaves were a minority.

Shared language was the first cultural element to appear in slave communities as the unwilling immigrants looked for ways to communicate with each other. Slaves in the isolated, overwhelmingly black low country combined various African tongues and some English words into a new language called Gullah. Their counterparts in North Carolina also created a Creole dialect, but they could usually speak English as well. The slave dialects of New England and the Chesapeake, on the other hand, contained some African words and grammar structures but were close enough to English that most whites could understand them. Although the "Africanness" of each regional dialect depended on local demographics, a distinctively African American way of speaking could be found everywhere. Slaves did not resist learning English when it was to their advantage, but they did not abandon the old ways either. In fact, some elements of their dialect, including words such as "okay," "banjo," and "yam," were absorbed into English.

The Slave Family

The most important institution in slave communities was the family. Some African-born slaves initially tried to marry within their ethnic group, but they were rarely able to do so. Other family traditions such as polygamy and bridal dowries also largely disappeared, victims of the slaves' limited marriage choices and dowries. Even traditional nuclear families were in peril of being broken apart at any time, since slaveholders had no legal obligation to sell family members together. Some families never lived in the same household; a slave who married someone from a neighboring plantation would only be able to see his or her spouse at holidays and during time off on Sundays.

As a result, the slaves' definition of family was often based as much on personal relationships as it was on bloodlines. Africans who had come over on the same slave ship shared a deep bond. Plantation communities, which were large enough to contain multiple households but small enough so that everyone knew each other well, were really extended families where everyone not related by blood was still an "aunt," "uncle," or "cousin." When parents and children were sold apart, members of the extended family quickly assumed parental responsibilities; there were no orphans in the slave community.

On most plantations, slaves lived in a collection of small huts known as "slave row." Though crudely built by uninterested masters, the slaves themselves organized, cleaned, and decorated their homes in traditional ways. The physical arrangement of many slave rows, for example, resembled that of West African villages. This became the center of the slaves' culture, their refuge away from the master's watchful eye. Many also tended small gardens, raising crops for personal consumption or for sale at local markets; some rural communities, in fact, became dependent on these gardens, since white landowners were focused on producing cash crops.

Within the slave community, religious leaders and skilled artisans—carpenters, blacksmiths, and others—occupied the highest level of the social hierarchy. These positions were usually dominated by men, although a great deal of influence was held by powerful matriarchs or by women skilled in the textile crafts. Domestic servants and slaves of mixed ancestry sometimes enjoyed a higher status, based on favorable treatment from the master, and those who were most familiar with white society also had an advantage over more recent immigrants, particularly in regions with large white populations.

For the most part, however, distinctions based on gender, place of birth, skill level, and complexion were mitigated by the fact that all slaves, regardless of their personal characteristics, were still slaves and still relegated to the lowest level of society. The world that the slaves created for themselves had room for all of these disparate groups.

Appearances

In this world, personal appearance and demeanor were an important form of self-expression and resistance. Slaves were issued Western-style clothing made from cheap, drab-colored cloth and were unable to reproduce most West African fabric patterns. They still created their own aesthetic, using brightly colored garments that had been produced by artisan women using plant dyes, as well as the old clothes of their masters. Through this they retained the African tradition of visual liveliness, in which bold colors are arranged to create a vibrant appearance.

Slaves also took care in arranging their hair into braids, wraps, shaved patterns, and long Afros, despite the fact that they had little time for personal grooming. Women often covered their hair with vividly colored bandannas, which served both form and function, since they added to a woman's personal appearance and also protected her head from the sun.

Even the body language of slaves—the positioning of one's hips, eyes, head, and hands—was important. In many African societies, a stiff posture was seen as a symbol of death, while flexed joints symbolized vitality. Body movement became a means to retain old traditions and quietly assert one's humanity without being directly confrontational.

For example, the practice of turning one's head to the side or rolling the eyes upward (now known as "rolling" or "cutting" eyes), which was used in African societies to show displeasure, took on an added meaning in America. Slaves were required to show deference to whites by not looking them in the eye, and cutting eyes seemingly satisfied white authority but also subtly challenged it.

Naming practices also show the slaves' retention of old traditions and creation of new ones. During the seventeenth and early eighteenth century, parents often gave their children African names that could be easily disguised as English words: Cudjo became Joe, Phiba became Phoebe, and so on. The common African practice of naming children after honored ancestors or based on which day of the week they had been born also continued in the colonies; some slave parents chose to use the English equivalent, so children might be given such names as Sunday or Wednesday. Masters might have found these names odd, but they rarely knew the hidden meaning behind them. Other names such as Quashie (Kwasi) and Cuffee (Kofi) had no English equivalent but could be easily pronounced by whites.

In short, naming practices were a way for African Americans to quietly assert their humanity in the face of ridicule or hostility. By the Revolution, however, many slaves had biblical or British names, since they identified themselves as African Americans rather than as members of separate ethnic groups.

Religion

From the early colonial period, religion played a central role in the culture of slave communities throughout the colonies. African slaves arrived in the Americas with a wide variety of faiths, including Islam and many indigenous belief systems, and many slaves practiced these beliefs without interference. Most masters were indifferent or hostile to their slaves' spiritual concerns, believing that blacks were culturally or racially incapable of receiving the Christian gospel, that Christianity would give them a dangerous sense of self-worth, or that conversion might be legal grounds for freedom.

Organizations like the Society for the Propagation of the Gospel in Foreign Parts tried to evangelize among the slaves but were handicapped by language barriers and limited resources. Finally, the slaves themselves saw little point in embracing the faith of their oppressors, especially since Christianity was used to justify slavery and white supremacy. Not surprisingly, the few slave conversions that took place were in New England and urban areas.

Christianity did take a greater hold in slave communities during the mass revivals of the 1740s known as the Great Awakening. Thousands were attracted to the newer Baptist and Methodist denominations, whose exuberant style of worship was similar to their African traditions and whose focus on personal,

heartfelt conversion rather than a formal theology provided them with the opportunity to become preachers. Like other aspects of slave culture, however, their religion was far different from what white society had intended. African Americans rejected the notion that God had ordained them to be inferior, obedient servants; they instead created an antislavery theology, using biblical stories of the Hebrews' escaping from bondage and then defeating enemy forces much larger than their own. For the most part, however, Christianity did not take hold in slave communities during the colonial period. By the end of the Revolution, only a small percentage of African Americans were Christian.

Most slaves practiced a folk religion centered on the belief that the real world and the spirit world were one and the same. It was thought that the dead continued to interact with the living; the black Christian practice of "catching the Holy Ghost" originated from this belief. Many slaves also believed that illness and misfortune were caused by an affront to the gods, a failure to properly honor one's ancestors, or the harmful intervention of a conjurer: one who had been blessed at birth with the ability to affect the natural world through the spirits. Conjurers became prominent members of the slave community, called on to heal illness, win the affections of a desired mate, provide spiritual assistance for a planned escape from slavery, and perform a number of other services. They were psychiatrists, doctors, spiritual leaders, and magicians for their communities, even to those who professed Christianity. In a confusing world, where punishment and mortality often seemed arbitrary, the notion that unseen forces could be used for both good and evil offered slaves a feeling of comfort and control.

Festivals

Music and dance also played a prominent role in the lives of the slaves. The sounds they created were again a blend of cultures, using African instruments such as the drum and kalimba alongside European instruments like the banjo, gourd, and fiddle. Satirical songs and dances, whose lyrics and structure mocked the pretensions of white society, were especially popular.

Festivals also were celebrated. In North Carolina, the Christmas holidays were recognized with a celebration known as John Canno. During the festivals of Election Day in New England and Pinkster Day in New York State and New Jersey, slaves put on their best clothes, sang and danced through the streets, and elected black "governors." Those elected became leaders within the slave community for the following year, settling minor disputes between slaves, and sometimes even imposing punishments, although only in cases where no whites or free blacks were involved.

Whites tolerated or even encouraged these festivals, seeing them as a useful way to release tension in an oppressed, politically weak group. Although many black governors were owned by powerful whites, their authority was not simply a by-product of the master's influence. These men carried real influence in the slave community by virtue of their intelligence, physical strength, or even the status that they had once held in Africa. Election Day and Pinkster Day were thus one of the slaves' best opportunities to enjoy cultural independence and a small measure of power.

A Cultural Blend

Africans arrived in the colonies disoriented, physically weak, and condemned to spend their lives struggling with the daily brutality and humiliation of being coerced laborers from a despised racial group. In spite of these obstacles, they created a culture that blended familiar traditions into a pan-African whole and combined it with borrowed elements from white society.

This enabled them to strengthen their communities, preserve something of their African past, assert their humanity, and make sense of their world. Their efforts would help to shape popular American culture and lay the foundation for the next 200 years of African American life.

Slave Rebellions

African American slaves engaged in countless rebellions and other acts of resistance during the colonial era. Although they were ultimately unsuccessful in overthrowing slavery, their constant low-level resistance, fugitivism, and armed rebellion was a constant thorn in the side of the slave regime.

Slave culture itself was inherently subversive, although not in ways that could be easily detected by whites. This culture was strongly influenced by West African traditions, especially in Charles Town, the Georgia Sea Islands, and other areas with large African-born populations. Folk stories about the trickster character Bre'r (short for "brother") Rabbit and real-life slaves who got the upper hand on whites through cunning and deception were circulated throughout slave communities. Songs such as "Many Thousand Gone," "Swing Low, Sweet Chariot," and "Go Down, Moses" carried a double meaning, speaking overtly of religious concerns but secretly carrying messages about freedom. The story of Moses and the Israelites' escape from Egyptian bondage was of particular importance in these songs and in African American Christianity generally. These elements and others created a climate of rebellion in slave communities.

Low-level, everyday rebelliousness was the most common form of slave resistance. One common tactic was stealing from the master; slaves did not consider this immoral, since their own coerced labor had produced the master's wealth. Arson and destruction of farm implements was also frequent. So many buildings and farm tools were destroyed that slaveholders began using brick instead of wood for construction and developed the steel "negro hoe," which was much more difficult to break than a traditional wooden hoe. Other forms of daily resistance included working slowly, feigning illness or pregnancy, arson, self-injury, poisoning, and even killing oneself or one's children. The men, women, and children who performed these acts did not take the more drastic step of running away or rebelling openly, but they nevertheless found other ways of resisting slavery and asserting their humanity.

Escape

Next to low-level resistance, running away was the most common form of slave rebelliousness. This struck a blow against the slave regime, but it also took the even bolder step of elevating the rebel to freedom. The decision to run away was usually a carefully calculated one. Some fugitives took to the main roads, pretending to be free blacks, slaves on legitimate errands, or (in the case of extremely light-skinned blacks) white travelers. The majority, however, were forced to take more arduous paths through the wilderness, where they fought hunger, exposure, and slave catchers. Most were caught or returned voluntarily within less than two weeks. Young men made up the largest number of fugitives, but women, families, and even entire plantation communities sometimes escaped as well. In all cases, the flight to freedom was a cooperative effort, as slave communities and free blacks (and some sympathetic whites as well) provided fugitives with food, supplies, and hiding places along the way.

The destination of fugitives varied over time and place. Although slavery was legal in all thirteen colonies and fleeing to the North was no guarantee of freedom, many fugitives nevertheless headed for Boston, New Bedford, and other Northern cities that were known for protecting runaways. Other urban areas were favored as well, since fugitives could blend in with their large free black populations. Some fugitives headed for Florida, where Spanish officials had promised freedom to any runaway who converted to Catholicism and aided them against the English.

Later, an even greater conflict would encourage fugitivism and other forms of rebellion on an unprecedented scale. During the American Revolution, thousands of slaves fled to British lines in Virginia and Staten Island, where they served as laborers, scouts, and soldiers in hopes of being freed by the British after the war. Thousands more fled to Northern cities, doubling the fugitive population in Philadelphia and quadrupling it in New York. After the Revolution, Northern slavery would never be the same, in part because of the efforts of fugitive slaves.

Petit marronage and *grand marronage* (from the Spanish word *cimarrón*, which originally referred to cattle that had escaped from their owner) were additional forms of slave resistance. *Petit marronage* was the act of temporarily running away to escape from physical punishment, to gain relief from the drudgery of slave labor, to visit other maroons (slaves engaged in *marronage*), or to negotiate with their masters for better treatment. Slaves may have been subjugated, but through *petit marronage* they were able to assume at least a small amount of power over their masters. Those who engaged in *grand marronage*, on the other hand, had no intention of ever returning to their masters or even living as free blacks in white society. These maroons—many of whom had been born free in Africa—sought to create independent societies in unsettled regions apart from white interference.

Maroon communities were commonly located in the mountains of North Carolina, marshes along the southern Atlantic coast, and the Great Dismal Swamp, a wetland on the Virginia/North Carolina border. The harshness of these environments, along with constant harassment from white militias, made it difficult for maroons to establish permanent settlements. Most were forced to move constantly and survive on food and supplies that they or their friends had stolen from nearby settlements. For a number of African Americans, however, living as free people in the wilderness was better than living as slaves on the plantation.

The success or failure of maroon communities was partly determined by whether local Native Americans chose to help them, ignore them, or side with whites against them. In some cases, maroons settled in Native American villages and became valued members of their societies. The most famous example of this occurred in the 1750s when a group of fugitive slaves and Creek Indians fled from Georgia to northern Florida and joined with natives in a biracial society known as the Seminole (from the Creek word for "runaway"). Combining Native American knowledge of the land with West African agricultural and military techniques, the Seminole successfully resisted white encroachment for nearly a century. Another successful maroon community was established near Savannah during the Revolution, when several hundred maroons formed an alliance with the British Army and waged a guerrilla war against the colonists from their large stockaded village.

Rebellion

The most direct but least frequent form of slave resistance was open rebellion, in which the slaves sought to overthrow their masters and then either flee elsewhere or completely topple the slave regime. In some instances, rebellions broke out spontaneously as a response to physical or sexual assault; scores of masters and overseers were injured or killed by slaves who suddenly rose up in self-defense. More common, however, were premeditated rebellions in which the target was slave society as a whole, not any specific individual. Even in these moments, however, rebels usually did not harm whites who were perceived as sympathetic, including Quakers, Catholics, French nationals, and anyone who had individually established good relations with them.

Premeditated rebellions could be inspired by rumors of imminent emancipation, the presence of free blacks, economic depression, or international conflicts. Combinations of these forces in fact led to large waves of slave resistance during the 1730s, the Seven Years' War, and the Revolution. It was more common, however, for slave rebels to act without any external influence, responding to nothing more than the oppressive brutality of their slave existence.

Colonial America's first slave rebellion took place in 1526, at the mouth of South Carolina's Pedee River, when a small group rebelled against their Spanish masters and fled into Native American territory. When the Spanish left for the Caribbean, America's first slave rebels also became its first permanent, non-Native American settlers. Slaves in the English settlements later carried on this tradition; in 1663, an alliance of slaves and white indentured servants formed the first major insurrectionist plot in British North America. The colonial legislatures attempted to prevent additional incidents by banning slaves from carrying anything that could be used as a weapon, from congregating without white supervision, or from interacting with Native Americans, but these efforts were not successful.

Northern cities quickly became a common site of slave rebellions. In 1638, a small uprising took place in Boston. Slaves and Native Americans in the New York area staged rebellions in 1709 and again in 1712, setting fire to buildings and killing a total of sixteen whites. After the second uprising, twenty-one rebels were tortured and killed, while many of New York's other 2,000 slaves fell victims to random violence and harsher restrictions. This wave of terror was repeated in 1741 after a series of mysterious fires. Although it is still unclear whether slaves actually started the fires, several were accused of conspiring to commit mass arson and to poison the water supply, and hundreds more were executed, beaten, or banished from New York. Other urban waves of destruction attributed to slave rebels took place in Boston and New Haven between 1721 and 1723, in Annapolis in 1739, and in Burlington, Pennsylvania, in 1741.

The most violent slave rebellion of the colonial period took place in 1739 at Stono, South Carolina. An African-born slave named Cato or Jemmy led twenty men and women to an armory on the Stono River near Charles Town; there, they captured weapons and began marching toward Florida, attracting eighty more slaves to their cause by beating messages on drums. The rebels were initially successful in driving off the militia, but after marching about 12 miles, they stopped to rest and thus gave their attackers time to regroup and re-engage them. In the end, between seven and twenty-five whites and about fifty slaves were killed either in the fighting or the subsequent criminal trials.

These events had such a traumatic effect on white South Carolinians that many of them seriously considered completely abolishing slavery, even though slaves made up over half the colony's population and were the backbone of its economy. Slavery would ultimately survive this crisis, but so did slave resistance.

In the end, all of colonial America's slave revolts failed to overthrow the institution. Many plots were betrayed by fellow slaves seeking freedom, financial reward, or white favor. Sheer demographics were an even greater problem; slaves never amounted to more than one-third of the colonial population, and most lived in small groups on isolated plantations. The white population was heavily armed, quick to respond to any real or imagined threat of insurrection, and unrepentant about punishing suspected rebels with torture or painful execution.

Nevertheless, slave resistance persisted throughout the colonial era, fundamentally affecting American society. It was a severe hindrance to the slave regime and the entire colonial economy. It shaped relations between European powers and between African Americans, white colonists, and Native Americans. Finally, it helped lead to the end of slavery in the North and the abolition of the international slave trade after the Revolution.

Slave Trade

The slave trade was an integral part of the mercantilist economic structure that operated among the colonies in North America. The early settlers initially attempted to enslave native peoples, a venture that proved unsuccessful. The introduction of African slavery provided a necessary labor source.

Until the late seventeenth century, slavery accounted for a relatively small portion of colonial laborers, as the indentured servitude of both whites and blacks was more common. By the dawn of the eighteenth century, however, slavery had become the dominant system, and the traffic in slaves was growing to match the demand.

Origins of the Slave Trade

African slaves first became commodities in international trade through Portuguese exploration. In 1441, Portuguese traders brought back to their country ten African natives; the captives, a gift for Prince Henry, had been abducted as curiosities rather than for sale. Just three years later, however, Portuguese traders returned with a cargo of 235 Africans as slaves. These captives were distributed among the regent of Portugal and the church.

The growth of sugar plantations in Portuguese colonies such as Brazil spurred a demand for cheap labor that was met by African slaves, and the Portuguese continued to control the slave trade through the sixteenth century. A series of papal bulls gave Portugal exclusive rights in Africa, thereby sanctioning the enslavement of its native peoples. In 1518, Portugal's King Charles V granted the governor of Bresa a monopoly on the annual shipment of 4,000 African slaves to the West Indies, evidence of how quickly the slave trade had grown.

By the eighteenth century, the slave trade had become an important and well-developed part of imperial and colonial economies. England, Portugal, and France were the primary nations involved, shipping well over half of the slaves traded from Africa during this time.

Throughout the 1700s, the English dominated the slave trade, primarily because of their preeminence as a maritime power. English traders had access to the necessary resources, both naval and financial. The continued growth of the English colonies and the strength of British manufacturing also served as assets.

Operation of the Slave Trade

The slave trade began in the interior regions of Africa. Most of the men and women who were captured and sold into slavery came from limited areas along the western coast of Africa, including Benin, the Gold Coast, Gambia, and Guinea. Captives were chained together in a coffle. The thirty to forty chained men and women were forced to march to the coast, often carrying goods to be traded, and it took several days to reach the slave trade ships.

As the slave trade grew, fortresses were established along the African coast to provide housing for the Europeans involved and to hold slaves until ships arrived with traders to purchase them. Fortresses such as Portugal's Elmina, in Ghana, included dungeons that housed 150 to 200 people at a time. The captives were fed twice a day and were subject to inhumane conditions for as long as three months before being sold to a ship's captain.

After being purchased, the slaves were packed into the holds of ships to be transported to the colonies in what was known as the Middle Passage. These ships were designed specifically to carry large numbers of human cargo, and slaves were chained together and stuffed into small spaces that prevented them from standing upright. The close quarters and lack of care resulted in diseases such as scurvy and dysentery among the captives. Historians estimate that the mortality rate for slaves subjected to the Middle Passage was as high as 13 percent. By the end of the seventeenth century, however, British slavers improved conditions so that the mortality rate dropped to as little as 3 percent.

Colonial Slave Traders

Colonial settlers and merchants also engaged in the slave trade. The first black laborers had arrived in Virginia in 1619 on a Dutch ship that sailed to Jamestown. That year, the earl of Warwick and Virginia's Captain Samuel Argall embarked on a voyage that included slaves. In 1630, another ship arrived in Virginia with slaves to sell. By 1636, the Northern colonies had begun their connection, when colonists at Marblehead built a ship, the *Desire*, to engage in the slave trade with the West Indies.

The number of black slaves in North America remained small throughout much of the seventeenth century. In 1650, only 2,000 blacks lived in the American colonies. By 1700, that number had escalated to 31,000 blacks, nearly all of them slaves.

Over the next fifty years, the slave trade became a prominent business in New England. By 1770, Rhode Island had 150 ships involved in the slave trade, and colonial legislation recognized the importance of this commerce to the local economy. Massachusetts tax laws benefited slave ships that docked at ports in the colony, allowing for a refund of the taxes imposed on importers of slaves. Other colonies established similar laws. In New Jersey, however, the tax on slaves was established as a means of prohibiting the importation of enslaved laborers into the colony.

New York's legislation was an attempt to encourage the importation of slaves directly from Africa by establishing a three pound tax on slaves imported from anywhere but the African coast. Although the slave trade constituted only a small portion of New York's entire overseas trade during the colonial period, New York served as an important point of entry. From 1700 to 1715, nearly 500 slaves entered the colonies via New York, with over half of them coming from other colonies and roughly 200 arriving directly from Africa. Between 1715 and the start of the American Revolution, New York served as the starting point for at least 120 slave voyages.

From its beginning, South Carolina was a slave colony; the establishment of large rice plantations increased the need for laborers and solidified the colony's position on slavery. During the eighteenth century, the colony purchased large numbers of slaves. In 1724, Joseph Wragg, captain of a slave ship, arrived with a shipment of 142 slaves, and at least four other slave ships stopped in South Carolina, bringing a total of 734 African slaves to the colony that year. Samuel Wragg, Joseph's brother and an agent for the colony, reported that, by 1726, South Carolinians purchased 1,000 slaves annually. He went on to make a contract with the Royal African Company, establishing the purchase of 300 slaves from Gambia to be sent to the colony.

The African slave trade originated in the interior regions of the continent, where natives were captured and marched in chains to sprawling compounds—such as this one in Nigeria in 1746—along the western coast to await shipment. (Library of Congress, LC-USZ62-106828)

In South Carolina, slave ships that arrived were generally arranged for by a local merchant, who would take responsibility for selling the slaves once they arrived in port, often including them as just another commodity in an existing import businesses. Henry Laurens was among the chief participants in South Carolina's slave trade in the eighteenth century; in 1755, Laurens reported that his business dealt with 700 slaves in that year. Laurens and fellow merchants who participated in the slave trade were generally members of the colonial elite, a position that gave them access to useful information regarding finances and crops.

Colonial traders rarely paid cash for the slaves they purchased from ship captains, and rarely received cash from the men and women who purchased slaves. In the early days, South Carolina merchants often paid for their cargoes in rice, and planters usually purchased their slaves on credit, paying the merchants in crops after the harvest. The extension of credit was a risky move for the merchants, and Laurens recommended to those wanting to become involved in the slave traffic that they hold a reserve of 10,000 pounds sterling.

The slave trade could be an extremely profitable business. In the last forty years of the eighteenth century, British slave traders received a total of 60 million pounds for the slaves they sold. The average profit for slave voyages during this time was nearly 10 percent, a significantly higher profit margin than the return on investment in colonial plantations.

Merchants who imported slaves sought to obtain those individuals who would be most marketable. In South Carolina, for instance, merchants preferred slaves from Gambia and the Gold Coast, as they were most in demand in the colony. Traders also preferred cargoes largely consisting of young men,

generally not over the age of 25, and young women under the age of 20. Young male slaves brought the highest profit margin.

The prices of slaves who arrived as part of the triangular trade varied from colony to colony and also depended on broader economic issues. In South Carolina, as in the other Southern colonies, which were the largest consumers of slave labor, prices were determined by such variables as taxes imposed on importation by the colonial government, the success or failure of crops, the availability of new land, the demand for slaves in other colonies, and wars occurring locally or in Europe.

From 1651 to 1675, slaves sold for an average of 5.26 pounds. In the last quarter of the seventeenth century, the average price dropped to 3.67 pounds as a result of increased availability of slaves in the colonies. Fifty years later, in 1751, the price for male slaves in South Carolina was around 250 pounds; female slaves were valued at around 200 pounds. In the next few years, the demand for slaves led to a jump in prices, and, in 1755, young men were selling for as much as 330 pounds. The demand drew slave traders to the colony and again resulted in a flooded market, bringing the price back down to 260 pounds for a male slave.

Banning the Slave Trade

Despite interruptions caused by the American Revolution, the slave trade to the new United States would flourish into the late eighteenth and early nineteenth centuries. But the tide of national and world opinion was running against it.

The slave trade became a source of debate at the Constitutional Convention in 1787. Most Northerners wanted to ban it; many Southerners wanted to keep it open. Ultimately, a compromise was reached. Article I, Section 9 of the Constitution prohibited Congress from banning the trade for twenty years. In 1807, Congress did just that, and the United States prohibited the importation of slaves after January 1, 1808. This followed a similar move by the British Parliament the year before.

Given the high value of slaves—especially after their importation was banned—smuggling continued. Ultimately, the importation of slaves into the United States did not end until slavery itself was destroyed in the Civil War.

Slavery, African American

By the 1640s, colonists found themselves in a crisis situation: there was a distinct shortage of labor in the New World. The settlers had been quick to recognize the agricultural potential of the land they had come to. Realizing this potential, however, was a goal that would prove highly labor-intensive. Furthermore, the land in the Middle and Southern colonies was particularly suited for producing cotton, rice, indigo, and especially tobacco—all labor-intensive crops.

Europeans did not arrive in sufficient numbers in the late seventeenth century to fill the need for this labor, and attempts to either hire or enslave Native Americans as field workers proved unsatisfactory. As a result, talk turned increasingly toward adapting the system of African slavery that had been so widely used in the Caribbean islands and Latin America.

As early as the sixteenth century, Africans had been brought from West Africa to work in Spain's New World colonies, and the Portuguese had brought slaves from Angola and Zaire to Brazil even earlier. Between 1433 and 1488, it is estimated that from 500 to 1,000 African slaves were imported annually to Portuguese colonies in the Western Hemisphere. Large shipments of African slaves began to arrive at the sugar cane plantations of Hispaniola (modern-day Haiti) in 1502. It has been estimated that, by the end of the 1500s, some 80,000 African slaves were being brought to the Spanish colonies

each year.

In light of this history, it is probably not surprising that American colonists began to consider importing slave labor by the late 1600s. Spain's and Portugal's relative successes in the enterprise, along with the widespread beliefs that Africans possessed almost superhuman physical strength and were genetically well suited to heavy labor in hotter climates than those of the Europeans' homelands, made the enslavement of African laborers an attractive solution to the colonies' need for workers. In addition, Africans' skin color was seen as a bonus by potential slaveholders: their blackness would make them stand out from their white fellows and make it more dangerous for them to attempt to escape.

Slave-Master Relations in the American Colonies

With the institutionalization of black slavery in the colonies, the relationship between masters and slaves became more rigid than that between masters and their indentured servants. Virginia led the colonies in slave ownership in 1756; the 120,000 slaves there comprised one half of the colony's population. In some regions, particularly areas of the Chesapeake tobacco country and virtually everywhere in South Carolina, blacks far outnumbered whites. Majority rule, then, was not in white colonists' best interests.

Instead, the dynamic between masters and African American slaves was based on power and fear, and, as a result, laws were quickly enacted to address the master-slave relationship. Colonial slave codes were heavily based on similar laws that had existed for decades in Caribbean slave culture. Although slave codes varied somewhat from one colony to the next, the effect was overwhelmingly uniform: African slaves were effectively redefined, and they were now legally considered to be property rather than human beings.

Under the slave codes, African Americans could not bear arms, they were forbidden to move about freely, and their rights to freely assemble or to seek legal redress were eliminated. The killing or maiming of one's own slaves was legalized as a "property right"; injuring or killing a slave owned by another was prosecuted as a crime against that owner's property. Rules for maintaining order among slave populations mandated various forms of punishment for misbehavior, such as guidelines that required whipping any slave who attempted to strike a white person. It is important to realize that such slave codes were in force in all of the colonies, although harsher laws were more prevalent in Southern areas.

Daily Life of Colonial Slaves

Daily life for any settler in colonial America was a difficult proposition, and African Americans' hardships were only exacerbated by the rigors of slavery. Nevertheless, slaves were able to develop a meaningful sense of community within the larger colonial society. The family was the traditional unit of society within African life, and slaves generally retained a strong sense of family, even within captivity. Although one's immediate family members might not have been present in a given setting, the slaves' world generally established a type of family unit within the slave quarters.

Males were usually considered dominant figures within slave life, although the restrictions imposed by slavery meant that slave men were less dominant than in their native situations. Slave women were by no means invisible or even marginalized within the family dynamic. In fact, because of necessities frequently imposed on them by their men's inability to act, slave women often were empowered within the family structure.

An important component of slave life was religious practice. Tribal religions often involved veneration of the ancestors and worship of nature. Some scholars have speculated that many Africans would have been exposed to the tenets of Islam prior to their removal to the colonies, and there are scattered references in early colonial records to slaves who prayed to a god named Allah. Missionaries had gone to western areas of Africa as early as the sixteenth century in an attempt to replace "paganism" with Christianity. The fact that this missionary activity overlapped with the slave trade both temporally and geographically may explain the fact that the Christian message was ignored by most Africans. However, the failure of these missionaries to convert natives in Africa did not deter missionary efforts towards African slaves within America. Records exist showing that as early as the 1620s and 1630s, Christian missionaries were attempting to evangelize "the black heathens" within the colonies.

Early religious outreach efforts toward African Americans were led by members of the Society of Friends. Quakers would continue to be among slaves' most outspoken advocates until the early 1800s. As early as 1700, Quakers established "meetings" (the denomination's name for their local congregations) specifically directed toward free and enslaved blacks. However, as the century wore on and the fear of blacks' rebellion plots grew among whites, many localities outlawed such meetings.

From the mid-eighteenth century through emancipation, African Americans formed a significant component of the growing Baptist and Methodist denominations. The first independent black congregation in the colonies, Silver Bluff Baptist Church, was established in the early 1770s in South Carolina. However, it was the exception rather than the rule, even among the Baptist and Methodist denominations. Fear of assembling and empowering slaves meant that there were few recognized clergy among colonial churches, and there were no blacks in any positions of church leadership.

This denial of formal organizational power did not preclude the establishment of informal, often secretive, networks based on social, religious, and even political grounds. The Stono Rebellion of 1739 made colonists feel vindicated in their fears of slaves' plots to overthrow their white masters. However, even these fears rose and fell over time and between one area and another. In 1702, for example, substantial numbers of enslaved and free blacks fought to defend various colonial strongholds against Native American and, at some times, French attackers. Well into the mid-1700s, in some regions, black indentured servants could reduce their terms of service by offering comparable amounts of time in military service to their colonies. During this same period, Virginia and South Carolina allowed indentured African Americans to enlist in their respective militias, and, in some cases, even slaves were allowed to serve.

By the time of the Revolutionary War, the need for troops loyal to the colonial position was desperate, so much so that both free and enslaved African Americans were called upon to serve their new nation. Several thousand slaves, mostly from the Northern colonies, were granted manumission and were freed following their service in the cause of the Revolution.

Slavery, Caribbean

African slave trading was a long-standing practice when the Portuguese reached West Africa. Between the tenth and fourteenth centuries, a trans-Saharan trade flourished, comprising mostly females bought as servants, agricultural workers, or concubines. Iberians got their slaves through Ceuta, Morocco.

When the Portuguese arrived in West Africa in the mid-fifteenth century, they dealt directly with the slavers, trying to satisfy a new market for slaves on the sugar plantations on the Atlantic islands of Madeira and São Tomé. The discovery that the New World contained prime sugar-producing land was a major stimulus to the slave trade.

Sugar

Sugar was rare and expensive in Europe when Muslims controlled the market. The Atlantic islands were a godsend for Europeans with a sweet tooth. Between 1441 and 1888, as many as 12 million mostly West and West Central Africans became slaves in the Americas. About two-thirds of all slaves worked in the sugar colonies.

The transatlantic slave trade was a key component of the development of colonial America under the mercantilist/capitalist economy. When, in the early seventeenth century, the British, French, and Dutch entered the Americas, their labor source was indentured servants, usually young European males who contracted for some or all of the cost of their passage and keep in return for three to seven years of labor. By the late seventeenth century, the need to produce tobacco, sugar, indigo (used to make blue dye), and rice demanded more labor than indenture provided. By the middle of the eighteenth century, the three largest slave colonies in the New World were Jamaica, Saint-Domingue, and Brazil. The principal money crop was sugar.

Sugar was highly profitable, returning about 10 percent on investment; in exceptional years, such as that in Barbados in the 1650s, it brought in 40 to 50 percent. Plantations varied in size by location and time. In 1680, the average Barbadian plantation had 60 slaves; Jamaica in the 1830s averaged about 150. Slave populations ranged from about one-third in late-eighteenth-century Cuba to 90 percent in Jamaica in 1730, Antigua half a century later, and Grenada in the 1830s.

Slaves were isolated from the white culture to emphasize the difference between the two. Slave codes, such as the Barbados Slave Act (1661), specified capital crimes as rape, arson, murder, assault, and theft of anything valued at greater than a shilling. Lesser crimes brought punishments including whipping, branding, and nose slitting. Castration was practiced if not officially sanctioned. The Barbadian code was a model for other English Caribbean colonies. Jamaican observers noted punishments including rubbing melted wax into lash wounds, amputations, impaling, and burning alive. Drawing and quartering was an option on Nevis.

In all cases, overseers checked cabins twice monthly for stolen goods and weapons, and slaves had to have a pass to visit off the plantation. The brutal culture allowed Sunday for rest, but otherwise slaves worked six ten- or twelve-hour days. During harvest, the shifts could be much longer. Commonly the rations were meager. Work and hunger were the norm.

Slave Culture

Slave culture retained some elements of African culture in the indifference and absence of owner imposition of white cultural values, including Christianity. Even when encouraged, Christianizing seemed to many owners to be a breaking down of the white-black barrier. Segregated slaves developed an African-English patois and established African customs in music, dance, funerals, and marriages that incorporated the various African practices of the many cultures thrown together. They also considered rebellion.

In a society where slaves outnumbered whites four to one, slave risings occurred often enough to keep the planters alert. Between 1640 and 1713 seven slave revolts produced death for white and black alike. Several other would-be revolts were aborted before they could cause damage. Slave rebellions occurred in Demerara in 1823 and Jamaica in 1831.

Jamaica was a hotbed due to the presence of escaped slaves, known as maroons, from the former Spanish plantations. Maroons were rebels hiding in the mountains and providing sanctuary for escapees from the English plantations. Jamaica was unusual; more commonly, there were fewer hiding places and no outlaws to provide support. Relative peace was the case in Barbados, Antigua, and St. Kitts and Nevis.

In Guyana, the first slaves were brought by Dutch settlers and traders in the early seventeenth century. Although the Dutch never developed extensive plantations, they took the slave trade from the Portuguese in the 1630s. The edge was only temporary, with the French and English vying for the trade in the 1640s, and Danes, Swedes, and Germans also entering the trade. The largest traders in the eighteenth century were the British, Portuguese, and French.

Slavery in Guyana was typically field slavery, which meant long hours along with inadequate clothing, shelter, and food. Slaves received little medical attention, and they were often punished severely and exploited sexually. Slavery was a lifetime status, changeable only by death, running away, or manumission. In 1825, Demerara-Essequibo had only forty-four manumitted slaves and a slave population nearing 72,000. Berbice had eleven in a slave population of 21,000.

Emancipation

Slavery was sanctioned and encouraged by European governments and churches. Not until the second half of the eighteenth century did Enlightenment thinkers such as Jean-Jacques Rousseau, in France, began speaking seriously and strongly of applying concepts expressed as liberty, equality, and fraternity. In England, the humanitarian movement had its origins in the strong evangelical movement that arose at the same time.

Britain outlawed slavery through the Somerset case in England in 1772 and the Knight case in Scotland in 1778. These cases involved only 14,000 to 15,000 slaves in both England and Scotland, which had a large if not surplus supply of free labor. Where slavery was more integral to the economy, specifically in the Caribbean, abolition was more difficult.

British antislavery efforts became more organized with the formation in 1787 of the Society for the Abolition of the Slave Trade. Leaders such as Thomas Clarkson, William Wilberforce, and Granville Sharp focused their attacks initially on the slave trade, not slavery itself. They campaigned to sensitize the public to the nature of the trade while simultaneously working for parliamentary action. In 1807, Parliament outlawed the slave trade for all British nationals and subjects. Emboldened by this success, the society sought next the abolition of slavery. Finally, in 1833, Parliament abolished slavery effective August 1, 1834.

Aside from humanitarian considerations and the pressure from abolitionists, Parliament's reluctant abolition rested on four considerations. First, the government had attempted since 1823 to convince Caribbean officials and owners to ameliorate the abysmal conditions of the slaves. Government recommended the outlawing of the flogging of women, the end of using the whip in the field, religious instruction and recognized marriages for all slaves, shorter working days, better clothing and food, and compulsory manumission. Planters in the Caribbean strongly opposed these reforms, especially in Jamaica and Barbados. But the planters lost their clout when the sugar economy began declining in the 1830s due to soil exhaustion and tumbling prices. Britain's economic interest in the West Indies waned with the decline of the sugar economy.

At the same time, the English saw value in Africa, as a provider not of slaves but of raw materials and markets for Britain's industrial revolution. Africa provided oils and cotton, and it bought manufactured goods. Africans were more valuable as producers and consumers in Africa than in the Caribbean as underconsuming, underproducing slaves. Economic pragmatism was a significant factor in changing Britain's long-standing policy.

There were other considerations as well, especially fear. Some in Britain believed that continuing slavery would increase the incidence of uprisings, which could result in a significant loss of property and lives.

A final factor leading to abolition was politics. Electoral reform in 1832 brought to power a reform majority in Parliament. The reformers enacted partial abolition in 1834, a transition "apprenticeship," and total abolition in 1838.

Smallpox

A highly contagious disease unknown in the New World prior to the arrival of Columbus, smallpox scarred and killed vast numbers of people during the colonial period. It spread only through direct human contact with infected bodily fluids or infected objects, such as bedding or clothing. With no effective treatment available, the only effective prevention practiced in this era was isolation from infected persons and inoculation with a small amount of the smallpox virus.

Smallpox, derived from the Latin word for “spotted,” refers to the raised bumps that appear after a person has been infected with the variola virus. Variola major is the most common form of the disease, with an overall fatality rate historically of about 30 percent. It is this form that struck most New World victims.

The disease in its early stages presented symptoms similar to those of influenza, specifically an intense headache and backache, fever, vomiting, and general malaise. Some people also experienced anxiety, but patients with this symptom, typically Native Americans, often succumbed before the appearance of the distinctive rash associated with the disease.

By the fourth day of disease, the first smallpox sores appeared in the mouth, throat, and nasal passages. At this point, the patient became contagious. Over a twenty-four-hour period, the rash gradually extended to the skin surface, covering the victim in raised pustules that concentrated on the soles of feet, palms of the hands, face, forearms, neck, and back. On some victims, the rash caused subcutaneous hemorrhaging from the gums, eyes, nose, and other orifices. As the rash progressed in the mouth and throat, drinking became difficult and dehydration followed. After two weeks, scabs formed and encrusted most of the body, making any movement painful.

Death commonly occurred between ten and sixteen days and disproportionately claimed the very young and very old. For those who did recover, all symptoms disappeared after about thirty days. Survivors, including future United States president George Washington, suffered from unsightly scarring and occasionally blindness, but they also had a lifelong immunity to the disease.

While smallpox is an age-old killer, the infection rate among populations with no prior exposure to the disease approached 80 percent, with a correspondingly high mortality rate that often exceeded 50 percent. It appeared to be more deadly among Native Americans, with twenty-three recorded epidemics prior to 1775. These epidemics caused the destruction of entire native villages with no one left even to bury the bodies.

Other factors worsened the Native American death rate. With everyone ill, no one remained to provide sustenance. Famine and dehydration claimed victims, while healing practices took additional lives. A popular remedy for illness, the sweat bath, exacerbated the effects of a high fever. On emerging from a sweat lodge, Native Americans would immerse themselves in the coldest and deepest part of a river. Badly weakened by the pox, many were unable to swim and drowned.

Colonists, just as desperate to find relief from the pox, also utilized sweat lodges, as well as fasting, bleeding, blistering, vomiting, and an array of medicines, including laxatives and mercury. The most effective approaches, however, were isolation and inoculation.

In 1647, the Puritan settlers of the Massachusetts Bay Colony implemented a quarantine to keep ships from spreading the disease and later ordered a red flag to fly outside infected households. During the 1721 Boston outbreak, which had a 15 percent fatality rate, 900 of the city's 10,700 colonists fled into the surrounding hills. Flight, although popular, did not offer the immunity of inoculation.

The deliberate implantation of live variola in an incision on a patient's hand or arm triggered a milder form of smallpox but did not lessen the infectious properties of the disease. While some colonists objected to those who attempted to circumvent God's will by inoculation, many others were angered by the introduction of smallpox in areas that were not experiencing outbreaks. Riots broke out at inoculation hospitals, and various legislatures enacted regulations to block the procedure in an effort to maintain public health and the peace. Even where the practice was known and permitted, the expense of inoculation placed it beyond the means of most Americans. Few workers could afford either its price or the weeks spent convalescing afterwards.

A notable smallpox outbreak in 1775–1782 affected the outcome of a number of battles during the American Revolution, and epidemics continued to rage after the war. In the late twentieth century, a successful vaccination program eliminated the disease worldwide, but variola remains a cause for concern as a possible agent of bioterrorism.

Smith, John (1580–1631)

More than any other figure, Captain John Smith deserves credit for the survival and early success of the Jamestown Colony. Although he was not a stockholder in the Virginia Company, company officials gave Smith a leadership role in the initial expedition in 1607 because of his previous military experience. At a time of severe emergency in the struggling English settlement, Smith took charge of the governing council, much to the chagrin of the gentlemen adventurers who made up the bulk of Jamestown's early population.

The military discipline and order that Smith put in place most likely saved the colony from extinction, but it raised dissent among the colonists, who had him replaced a little more than a year later. The colony soon missed Smith's leadership skills and the discipline he had imposed. During the "starving time" of the winter of 1609–1610, the Jamestown settlers suffered terribly.

John Smith's greatest failing was in Native American relations. Contrary to the romantic mythmaking he himself encouraged, his bombastic policies toward the tribes of the Powhatan Confederacy set Jamestown and the Virginia colony on a course for recurrent conflict with its native neighbors.

Early Years

The future governor of the Jamestown colony was born to a humble but respectable yeoman farming family in Lincolnshire, England, in 1580. In his youth, John received some schooling and served as an apprentice to Thomas Sewell, a merchant in Willoughby-by-Alford, Smith's hometown. But the young John Smith longed for adventures "beyond the sea." When his father died in 1596, he jumped at his first opportunity to live the adventurous life of a soldier. In 1597, at the age of 17, he joined a group of English volunteers fighting against the Spanish in the cause of Dutch independence.

After fighting for two years in the Low Countries, Smith returned briefly to England before setting off again in 1600 as a mercenary in an Austrian expedition against the Turks. During this campaign, he was promoted to captain.

We have only Smith's own swashbuckling account of his adventures in Europe and Turkey to draw upon for knowledge of this segment of his life. In his autobiography, *The True Travels, Adventures, and Observations of Captaine John Smith* (1630), he describes fighting duels against the Turkish champion, his capture in Transylvania, and his subsequent escape from captivity in Turkey. Smith claimed that the Pasha's wife fell in love with him and aided his escape—not the last time the charity of a well-wishing female would intervene on his behalf, if Smith's accounts can be believed. After his escape, he traveled through Russia and Europe to Morocco before returning to England in 1604 or 1605.

The legendary Captain John Smith, portrayed here in an engraving from his Description of New England (1616), is rightly credited with founding the first permanent English colony at Jamestown. (Private Collection/Lauros/Giraudon/Bridgeman Art Library)

Smith did not remain long in England before he again sought travel and adventure. He became interested in the colonization movement then being promoted in England as a means of relieving the surplus population and furthering the economic interests of the mother country.

Because of his military experience and no doubt due to his propensity for self-promotion, the Virginia Company chose Smith to be a member of its first expedition to Virginia. Along with 143 others, Smith set sail for America and was present when the colonists founded Jamestown on May 13, 1607.

In Jamestown

The English settlers at Jamestown struggled to survive in the early period of the colony's existence. Disease, malnutrition, and attacks by the natives diminished the population by more than 50 percent in the first year. After constructing a palisade fort and naming the settlement after their monarch, the English at Jamestown seemed unable or unwilling to work together for survival. Many refused to work or were too sick to do so.

Promoters of colonization in England had misinformed prospective colonists that the native peoples, docile and childlike as they were supposed to be, would willingly give the Europeans food out of their abundance. So the colonists concentrated their efforts on exploring the region and looking for gold. John Smith himself led several of these expeditions, and he was one of the first to make contact with the Powhatan Indians.

Though exceptional in many ways, John Smith shared the Englishman's ethnocentric appraisal of the natives. Like others, he regarded the indigenous peoples as inferior and available to be used for the purposes of the white settlers. The Eastern woodland tribes lived just above subsistence level and did not possess the reserves to feed additional hungry adventurers. When the local tribes balked at the amount of food the Englishmen demanded, Smith led punitive expeditions against them to seize the supplies. These early clashes did more than anything else to set English-Native American relations in the Chesapeake down a path of significant conflict in later years.

The tribes near Jamestown were part of the Powhatan Confederacy, which consisted of more than thirty tribes led by a "great chief," Powhatan himself. Initially, Powhatan regarded the English at Jamestown as insignificant and gave them food out of pity. Soon, however, the native peoples discovered that the settlers possessed firearms and metal implements, and Powhatan sought to make the English into subordinate allies in his struggle against his inland enemies. This was most likely the aim behind the capture and "trial" of John Smith.

In late 1607, when Smith led a group exploring the region near Jamestown, a hunting band from one of Powhatan's tribes attacked the Englishmen. The other colonists were killed, but the natives presented Smith to Powhatan as a captive.

In his *Generall Historie of Virginia, New England, and the Summer Isles* (1624), Smith described what took place next as a trial in which he was sentenced to death. He claimed that he was rescued by the intervention of Pocahontas, Powhatan's 11-year-old daughter. For the Powhatan people, this ritual display of mercy probably signified that Smith was to become a subordinate chief, with obligations of loyalty to their chief. The import of the ceremony was apparently lost on Smith, however, as he attributed his rescue to the girl's personal regard.

After spending the summer of 1608 in further explorations, during which time he gathered information that would later be used to complete his detailed map of Virginia, Smith returned to Jamestown. During his absence, Captain Christopher Newport had assumed leadership of the colony. Native American relations had deteriorated even further, and several tribes had become openly hostile. Disease, coupled with the lack of effective leadership, also had taken a heavy toll on the settlement. When Newport returned to England, Smith became president of the council, which made him, effectively, governor of Virginia.

To save the colony from impending disaster, Smith ordered the unruly colonists to work and established a regimen that the highborn gentlemen resented.

Forcing them to farm and dig wells made Smith none too popular; however, he threatened to banish and let starve anyone who refused to engage in productive labor. He also dispersed the colonists into smaller settlements in the interior, in order to move them away from the unhealthy swamps around the James River. During Smith's tenure as leader of the colony, a semblance of order and stability was restored, and the death rate declined significantly due to the dispersal of the population and relocation to healthier areas.

It is unfortunate that Smith continued the practice of using force and intimidation against the native populations. In later years, after he had left the colony, Powhatan would drive the English back inside their palisade and lay siege to the settlement. The result was the "starving time" of the winter of 1609–1610, during which the bulk of the population of the colony died and several even resorted to cannibalism. Safely at home in England, on being informed of one colonist's cannibalism of his wife, John Smith quipped darkly, "[of a] dish such as salted wife I never heard."

Downfall from Power

In 1609, the Virginia Company dispatched a new group of colonists to Virginia, along with a new governor to replace the unpopular Smith. Smith himself was badly injured in a gunpowder explosion in October, and he returned to England to recover from severe burns. There, he remained a staunch promoter of Jamestown, although he became a harsh critic of the Virginia Company and the leaders it chose to guide the struggling colony.

Smith's only additional voyage was a brief trip in 1614, sponsored by a group of London merchants, to promote colonization and trade in New England. Afterward, he published a tract entitled *A Description of New England* (1616), maintaining that Northern lands of the North American seaboard would make a more successful ground for colonies than Virginia. He argued that a successful colony should pursue the steady development of agriculture and industry, rather than pinning its hopes on instant riches as the early Virginians had.

Smith continued to spend his remaining years as an ardent proponent of colonization. In all, he wrote and published eight books on the topic, as well as two works on seamanship. He died on June 21, 1631, and is buried in St. Sepulchre's Church in London.

Sons of Liberty

Giving a voice and participation to the average American colonist, the Sons of Liberty were actively involved in violent resistance to the Stamp Act of 1765. Opposition to British legislation by such rebellious and independent groups would do much to bring about the American Revolution.

In an effort to defray the expense of the Seven Years' War and the cost of maintaining troops and forts along the American frontier, the British Parliament began taxing the colonies in the early 1760s. It was in North America, after all, that the British Empire had acquired such debt. Proposed taxes in the colonies, much to their surprise, however, were widely resisted by politicians and ordinary citizens alike.

Following the unsuccessful Sugar Act of 1764, Parliament proposed a tax that would raise revenue in the colonies by taxing everyday paper goods such as books, documents, and newspapers. This Stamp Act, which was not an uncommon form of taxation in England, brought about violent mob reactions in the American colonies.

Unlike the Sugar Act of the previous year, the proposed tax, which was to become effective November 1, 1765, affected every colonist and brought up

constitutional arguments against laws imposed from outside the colonies. The proposed legislation was seen as a symbol of British tyranny over the colonies.

In response, during the early summer of 1765, a group of workers, tradesmen, artisans, and lawless seamen, known as the Loyal Nine, began agitating against the Stamp Act. After changing their name to the Sons of Liberty, when Isaac Barré referred to Americans by this title in a speech against the act in the House of Commons, the organization began to use coercive measures and mob violence to destroy the new legislation.

Although the Sons of Liberty often resorted to lawless mob activity, most of the emerging groups throughout the colonies were under the leadership of upper-class merchants and politicians. These leaders, such as Samuel and John Adams of Boston, who had much to lose if such an act were passed, anonymously organized the actions of the groups. Even radical leaders were occasionally threatened, as unruly mobs made up of members of the Sons of Liberty spun out of control.

The Sons of Liberty Bowl, a cherished symbol of the struggle for independence, was commissioned of Paul Revere by members of the secret organization in 1768. It honored an act of defiance by the Massachusetts legislature against the Townshend Acts. (Museum of Fine Arts, Boston/Bridgeman Art Library)

One of the first widely known acts carried out by the Sons of Liberty took place on August 14, 1765, when Andrew Oliver, a stamp distributor, was hung in effigy on the “liberty tree” in Boston. The rowdy mob later ransacked the structure that was being built as the stamp office and forced Oliver to publicly resign his position as a stamp official. Less than two weeks later, on August 26, the mob spent an entire night demolishing Governor Thomas Hutchinson's home.

The Sons of Liberty became so intimidating—burning effigies, destroying property, and threatening lives—that they were able to force the resignation of all stamp agents in the colonies before the act ever took effect. Local officials were unwilling to respond to these violent mob actions for fear of their lives.

As resistance to the Stamp Act mounted, correspondence and coordination of defiant actions took place throughout the colonies. Beyond simple violence directed toward British leaders and institutions in the colonies, the Sons of Liberty took it upon themselves to coerce American merchants and ordinary citizens to comply with nonimportation and nonconsumption agreements. Their efforts, especially in enforcing economic sanctions against the British, led many English merchants to join the clamor for the repeal of the Stamp Act.

When the Stamp Act did take effect in November, Americans went about their business largely ignoring the new legislation. The ineffectiveness of the act, together with its condemnation by most British merchants, led to its repeal just months after it was enacted.

Although the Sons of Liberty movement broke up after the repeal of the Stamp Act, it was revived again in 1767 in response to the Townshend Revenue Acts. Many members continued in active correspondence and in organizing resistive efforts against British legislation, until the group finally disbanded for good in 1783.

Despite its short history, the Sons of Liberty provided a way for ordinary Americans to express their opposition to British policies in the colonies. The radical response to the Stamp Act and ultimate victory of the Sons of Liberty in pressuring Parliament to repeal the act gave its members experience from which they would draw throughout the American Revolutionary crisis.

South Carolina

By the time of the American War for Independence, South Carolina was a prosperous plantation colony. It was home to some of the wealthiest men in America and to one of the colonies' most refined cities, Charles Town (it became Charleston late in the eighteenth century). South Carolina was also the home of a large population of African and African American slave men and women.

Through slightly more than a century of serious English colonial activity, a small, relatively harmonious planter elite had clawed its way to the top of a society wracked by divisions of class and race. The dominance of English planters was far from assured in the colony's early years. Both Spanish and English forces claimed the area, which was, of course, largely controlled by native peoples. The story of South Carolina's colonial development is a story of halting, uneven Spanish and English colonization, native and African American resistance, and intercultural violence.

Native Life and Spanish Incursions

For much of South Carolina's colonial history, the region was mostly native land. When armies of Spaniards began to wind through South Carolina in the sixteenth century, they came upon large paramount chiefdoms, the main one being that of Cofitachequi, near present-day Camden. In the years before European colonization, the world of the Mississippian chiefdoms was already changing, and the arrival of the Spanish sped up these changes. Across the Southeast, large chiefdoms were dispersing into smaller groups of autonomous villages and bands, the tribes that would face the full force of English settlement in the late seventeenth and eighteenth centuries.

Native life in South Carolina was strikingly diverse. Scores of different languages were spoken, and these spanned a number of linguistic groups: Siouan, Iroquoian, Muskogean, and Algonquian. Tribes ranged in size from tiny enclaves along the resource-rich Atlantic coast to more numerous inland nations such as the Cherokee and Creek.

Most native peoples in South Carolina lived in permanent or semipermanent villages centered around agriculture. Beans, corn, and squash were the main crops. Agriculture and domestic life were the exclusive province of women, while men engaged in a separate sphere of activities, including hunting, warfare, trade, and diplomacy. The clan was the basic unit of native society, and through one's clan—an association almost always passed down through the mother—one gained access to a wide-ranging network of kin. Clan membership guided marriage choices and prescribed punishments for crimes. Numerous and often complex ceremonies accompanied many different aspects of native life.

In the first half of the sixteenth century, Spanish conquistadors and explorers began to spread out from their base of operations in the Caribbean. From 1539 to 1542, largely as a result of Cabeza de Vaca's reports of his improbable journey and exaggerated riches in the interior Southeast, Hernando de Soto launched an exploratory probe, an *entrada*, into the area.

In what later would become South Carolina, de Soto's army came across the paramount chiefdom of Cofitachequi, ruled by a woman, the "Lady of Cofitachequi." Upon his arrival in Cofitachequi, de Soto appears to have received treatment befitting a dignitary. Following protocol established at other points in the *entrada*, however, he took several Cofitachequis hostage to ensure safe passage through the chiefdom. Although he found the pearls of Cofitachequi irregular and small, he also ordered his soldiers to raid a burial site and remove a large quantity of pearls from the body cavities of deceased natives. Thus, de Soto's party soon wore out its welcome.

The Spanish never succeeded in establishing a colony in the interior of South Carolina, although Franciscans established some missions in the Sea Islands. Nevertheless, diseases introduced to South Carolina by European explorers devastated native communities; when the English began to colonize the area in the closing decades of the eighteenth century, they entered a shattered world.

English Beginnings in South Carolina

Founded in 1670, South Carolina was a relatively late addition to the English colonial world. To the north, Virginia and Massachusetts Bay were growing and prospering. In the Caribbean, Barbados was flourishing as a result of a booming sugar trade. Charles II's restored monarchy had advanced English colonization throughout the Americas, adding New York and securing Jamaica.

Prominent men who had remained loyal to the king began to call in favors, and Anthony Ashley Cooper—who would soon become Lord Shaftesbury—led a renewed drive to plant an English colony in the American Southeast. To aid in this task, Shaftesbury drew up the Fundamental Constitutions, a series of guidelines that would set up a utopian, hierarchical society in South Carolina. It bears mentioning that Shaftesbury's personal secretary was John Locke, though what effect the philosopher actually had on these guidelines is unknown.

proprietors insisted on treating Native Americans fairly in trade and land negotiations, but white South Carolinians treated the native peoples horribly, inciting wars between tribes, enslaving the losers, and driving the winners into increasing debt and dependence. In addition, the proprietors had hoped to recoup their investment by a monopoly over the trade in deerskins, but the Goose Creek men kept the profits, which were substantial, for themselves.

In what has been described as the “Revolution of 1719,” the lords proprietors relinquished their weak grip on South Carolina. By the end of the 1720s, the Crown had bought out the proprietors, and the transition to royal government was complete.

A Mature Colonial Society and Independence

The Yamasee War and the Revolution of 1719 allowed the Goose Creek men and like-minded white Carolinians to rid themselves of two forces they perceived as holding them back: Native Americans and the proprietors. Colonial society in South Carolina was developing along lines that favored owners of large plantations, worked by large numbers of black men and women.

In 1739, slaves at Stono, just outside of Charles Town, rose up against their masters in one of the largest slave rebellions ever undertaken in American history. Twenty or so Angolans, under the leadership of a black man named Jemmy (some sources spell the name Jemy), attacked a store early on a September Sunday morning. The attackers quickly overpowered and killed the shopkeeper and began to distribute arms and powder to slaves on nearby plantations. By afternoon, between 60 and 100 slaves were on the march. Their destination is not known, but it was probably Spanish St. Augustine, which had offered fugitive slaves refuge in the past. A hastily assembled white militia put down the rebellion, and many of the participants were executed.

A new slave code enacted in 1740 assuaged some of the planters' fears, but it was not strictly enforced. Generally speaking, planters were frightened of their slaves, so they put a system in place that would keep slaves frightened of them as well. Though slaves would continue to resist their masters in small ways on a day-to-day basis, for the rest of the colonial period, they would not again mount so direct a challenge.

For most of its history, South Carolina had developed as a British colony on its own, a beneficiary of the British policy known as “benign neglect.” In the middle of the eighteenth century, Great Britain took a renewed interest in the management of its empire and sought to profit from it.

The French and Indian War (known in Europe as the Seven Years' War) did not affect South Carolina as much as it did other colonies. South Carolina did, however, undertake an ill-conceived campaign against the Cherokee that accomplished little, apart from poisoning relations between the two groups for decades.

Reaction against the Stamp Act in South Carolina was particularly vociferous, and a passionate Sons of Liberty movement grew up in Charles Town. Yet the movement toward independence revealed deep divisions in South Carolina's society. Not only had coastal planters and politicians fought with a rising class of backcountry planters in the Regulator movement of the 1760s, they also had fought among themselves.

In 1775, the royal governor moved his offices to a ship in Charles Town harbor, essentially turning the city over to the Revolutionaries. Loyalist and patriot militias ranged through the backcountry. Many of South Carolina's slaves used the confusion of the fighting to seek their freedom, either by joining the British or running away.

Throughout the Revolutionary War, British and American forces alternately controlled the crucial port at Charles Town, while rival militias ravaged the Piedmont and the upcountry. In 1780, Charles Town fell to the British, but an American victory at Cowpens forced the British to abandon the city in 1782.

After the fighting ended, South Carolina's planters were in a delicate position. Their economic fate was in the hands of British creditors and trading houses, and many wanted a quick return to business as usual. On the other hand, their political fate was in the hands of the victorious Revolutionaries. Although loyalists in South Carolina received leniency in most cases, the protection of private property, including plantations and slaves, trumped other political concerns.

In the nascent government of the United States, South Carolina took on a large role for such a small state. South Carolina's immense wealth and its leading citizens' reputation for fiery oratory would give the state a prominent part in the formation of the federal government.

Sports and Recreation

Sports and recreation were a part of colonial American life in every region and for men of every ethnicity and social class, although social status often determined what sorts of sports a man played. Sports served a variety of functions, including military training, reinforcing hierarchy, and allowing elite men to compete in a relatively safe environment. Women participated in certain recreational activities, such as music making and dancing, but blood sports and athletic competition were almost without exception male avocations.

Before the arrival of Europeans, the native peoples of North America played a variety of games and sports. In the Southeast, many tribes played ball games akin to lacrosse; in the Northeast, Five Nations Iroquois were renowned for their matches. Teams representing villages or clans would struggle to get possession of a small deerskin ball in their netted sticks, then hurl or carry the ball into a goal. Play was rough, and some tribes used the exercise to accumulate the skills necessary for combat. Often, spring ceremonies, like the Green Corn, would conclude with large ball games.

Southeastern Native Americans also played a game called chunky, in which two men would compete to cast poles near to a thrown stone. Chunky was not as violent as the ball game, but players still competed intensely, both players and onlookers wagered extravagantly on the contest, and humiliation and scorn were the loser's lot.

The English brought their own forms of sport and recreation to America. In New England, people engaged in all sorts of games, much to the chagrin of Puritan authorities, who were constantly legislating against various diversions. Games that involved gambling and drinking, such as cards, dice, shuffleboard, and horse racing, were frowned upon. Militia companies, however, were required to engage in regular sports; as with the native peoples, these sports helped keep them fit and enhanced training.

Individuals were also encouraged to ice skate and engage in other respectable sports. The Boston game—an early form of American football—was imported from English villages and thrived in New England. Some Puritan moralists disapproved of the rough team game, but once it was regulated, towns, academies, and colleges began to engage in the sport with official approval. The Massachusetts game—also known as the New England game or bittle-battle—featured many of the characteristics of modern baseball, including a pitcher, a batter, and four bases.

Southern sporting life was determined by region and class. Southern colonies were much more stratified than their Northern counterparts, and deep societal divisions appeared in people's recreational choices. Elites in Virginia and the Carolinas participated in horse races and cockfights. Lower-class people were legally barred from competing in horse races, although they did watch and wager, sometimes enjoying liquor provided by their betters. Elite men used the races as an excuse to display their wealth, often through high-stakes wagers. Lower-level, well-to-do Virginians imported the red fox for their hunts. And, as in New England, men of various classes engaged in games with cards and dice.

Poorer Southerners and slaves competed in their own forms of recreation. One of the more gruesome forms was the gander pull, popular in the backcountry. Contestants would ride by a gander—with a greased neck, suspended upside-down from a tree branch—at a full gallop, and attempt to rip the animal's head off. Children learned to compete in blood sports from an early age. In one contest known as “muzzling the sparrow,” young men, hands tied behind their backs, held a small bird by the wing with their teeth. The object of the game was to bite the sparrow's head off.

Music and dancing were two recreational activities enjoyed by men and women together, although the forms varied according to class, race, and region. Every culture that came to America brought its own folk dances and music. Dances accompanied important social occasions, such as weddings and holidays, in many communities.

Among upper-class Virginians, daughters and sons were schooled from an early age in music and dance, since their level of refinement correlated with opportunities for a good marriage. Virginia's gentry class took dance very seriously.

Sports and recreation played an important role in American colonial life, whether the participants were male or female, native or nonnative, slave or free, elite or common. In fact, many of the contests in which colonial Americans engaged reflected the tensions of class, race, and gender that underlaid much of life in Britain's North American colonies.

Squanto (c. 1590–1622)

Squanto (the anglicized version of Tisquantum) was born in Patuxet, a village of 2,000 Wampanoags on Plymouth Bay in present-day Massachusetts, around 1590. During his life, he lived as a member of the Wampanoag tribe, as a slave to a sea captain, as a free man both in Spain and in England, and finally among the English Pilgrims at Plymouth.

Squanto, an Indian of the Patuxet tribe, was a guide, interpreter, and friend of the Puritan settlers at Plymouth Colony. He taught them how to grow crops using fish as fertilizer and helped arrange a peace treaty with area natives. (Private Collection/Bridgeman Art Library)

The Wampanoag at Patuxet integrated themselves into the colonial world by trading extra corn and furs with explorers they viewed as friendly and warding off those they perceived as hostile. In 1614, John Smith, of Virginia fame, arrived in Patuxet. Smith initially fought with the native peoples, but he later made peace and returned to England. He left a ship behind to fish for cod under the leadership of Thomas Hunt.

Hunt lured about twenty Native Americans on board and then took off for Spain. When Hunt reached Málaga, he began selling his captives as slaves, a process some priests forced him to abandon. It appears that they intended to convert Squanto and the others to Christianity. Squanto disappears from the documentary record at this point.

In 1617, Squanto resurfaced in London. He lived with John Slany, the treasurer of the Newfoundland Company for a time. He studied the English language and English culture, and he gradually became convinced that someone associated with English colonization could return him to Patuxet. On an expedition to Newfoundland, Squanto got to know Thomas Dermer (the two had met previously in 1614, when Dermer served under John Smith on his fateful voyage to Patuxet). Back in England, Dermer introduced Squanto to Sir Ferdinando Gorges, a principal colonizer of New England during the early seventeenth century. Gorges recognized that Squanto could be of great assistance.

The New England to which Squanto returned in 1619 was profoundly different from the place he had left behind in 1614. His own village, Patuxet, no longer existed, owing to recent disease epidemics. In fact, many of the coastal communities lost up to 90 percent of their population. Stunned survivors regrouped into different communities and struggled to meet the challenges of their new world. The Wampanoag found it more and more difficult to resist

incursions and tribute demands by the Narragansett, their powerful neighbors to the west.

Squanto's particular skills served the Dermer party well in 1619, when he eased the Wampanoag Chief Massasoit's concerns about the English. When the party returned the next year, the response was more hostile. Dermer was killed in a clash with the Wampanoag on Martha's Vineyard, and Squanto was captured and brought to the Pokanoket, a community among the Wampanoag and the home village of Massasoit.

In 1620, a group of English religious refugees arrived at Plymouth Bay. During the well-documented "starving time" that winter, half of them died. In the spring, Massasoit dispatched a series of emissaries to the English. The most knowledgeable was Squanto.

Squanto's assistance to the English at Plymouth would prove invaluable. He taught them how to plant corn using fish as fertilizer, but also, more importantly, he secured a treaty that would ensure peace between the Pokanoket, the Nemasket, and the struggling Plymouth Colony. During this same time, Squanto came to live with the English at Plymouth, where he continued to make treaties and assist the colonists.

Diplomatic intrigues diminished Squanto's usefulness to the English. In 1621, the Pilgrims invited a second Native American, a Pokanoket named Hobbamock, to live with them. Squanto seems to have inflated his prestige in English society when dealing with Massasoit and his prestige with Massasoit when dealing with the English. As a result, he ran afoul of both groups and required English protection against Massasoit. In 1622, Squanto died of a fever.

Many accounts of the Pilgrims include the story of how Squanto helped the English; his legacy has been reduced to that of simply a friendly native. His real story is more complex and dramatic than that. Squanto bridged worlds that today seem oceans apart, although they were not all that distinct during the colonial period. His story proves that a single person could move between them.

St. Augustine

In 1565, Menéndez de Avilés founded St. Augustine, one of two precariously established Spanish footholds in what would later become the United States. Initially, a small, insignificant outpost along Florida's Atlantic coast, St. Augustine remains the oldest European urban center in the present-day United States.

Basically a fortified military post with little economic importance, St. Augustine served Spain as one of the last naval bases and defensive positions for the galleons of the Spanish treasure fleet as they made their yearly trip to Spain. Since even in a bad year, the treasure fleets carried considerable cargoes of gold and silver, they persistently attracted official and unofficial raids from pirates and privateers of English, Dutch, and French origin. But the treasure fleet was not the only target. St. Augustine was besieged on numerous occasions throughout its history (once even drawing the attention of Francis Drake); it was last occupied by foreign invaders in 1702.

St. Augustine at its founding was supposed to be an important part of the Spanish empire, but its value had diminished by the end of the sixteenth century. The Spanish decision to establish St. Augustine came as a direct result of attempts by other European nations to build colonies in North America, particularly the French, who had built a small Huguenot town in northern Florida in 1564. After eliminating the French presence, Avilés planted the St. Augustine colony in an extremely advantageous position.

A massive stone fortress built in St. Augustine, Florida, in 1672, Castillo San Marcos (later renamed Fort Marion) guarded that early Spanish settlement from English aggression and protected the sea route for treasure ships returning to Spain. (Library of Congress, LC-D4-13354)

Situated on a peninsula that jugged out into Matanzas Bay, the rectangular walled town was surrounded by a series of palisades on one side and water on the others. With only one exposed land approach, Avilés set up three parallel lines of defense to protect the city walls. As a last-ditch protection for the city gate, the Spanish consecutively built nine wooden forts; these were all destroyed by invading forces, until they were finally replaced in 1672 by the stone ramparts of the Castillo de San Marcos.

At the end of the French and Indian War (known as the Seven Years' War in Europe), St. Augustine and west Florida were transferred from Spanish ownership to the British. Still only sparsely populated, the city nearly doubled in size with the arrival of a British garrison. After the American Revolution, St. Augustine again changed hands, when the British returned it to Spain, an ally of the United States, in 1783 as part of the Treaty of Paris.

Never expanding beyond the size of approximately four hundred structures during most of its history, St. Augustine, like most settlements in the New World, was a cosmopolitan mixed-race community. Under the Spanish, the town was dominated by individuals of Spanish mainland descent but also included Africans, Native Americans, various Europeans from nations allied with Spain, and people from the Caribbean and coastal Latin America. When the city was transferred to Britain at the end of the French and Indian War, the already diverse population of St. Augustine was expanded to include English, Scots, Scots-Irish, French Huguenots, and Americans.

Beyond the military garrisons and civil servants that composed nearly half of the population, occupations in St. Augustine varied very much as they did in other colonial settlements. There were merchants, Native American traders, planters, shoemakers, chain makers, cabinetmakers, butchers, bakers, innkeepers, storekeepers, blacksmiths, haberdashers, ship's caulkers, carpenters, goldsmiths, surveyors, millwrights, joiners, machinists, stonecutters, brick makers, chair makers, hostlers, lawyers, physicians, day laborers, hunters, slaves, servants, and even a few prostitutes. Religious institutions were also ubiquitous, since the Spanish established a Catholic monastery early on and the British brought Protestant ministers.

St. Kitts

The lush island of Saint Christopher, or St. Kitts, is located among the closely grouped cluster of the Leeward Islands in the northeastern Caribbean. Club-shaped St. Kitts is just 68 square miles in size and is positioned like an exclamation point with its twin island, Nevis, offset to the south. Both islands are volcanic in origin. In the 1600s, St. Kitts offered the best land in the Leewards, with plentiful rain and fertile soil but high rates of erosion when deforested. Dominated by the aptly named Mount Misery, about half the land area was suitable for cultivation, mainly the hill slopes and coastal plain.

Developed simultaneously by the French and English for the first century after its discovery, the joint occupation of St. Kitts irritated relations between the two nations. As a result, the island changed hands seven times between 1666 and 1713, and substantial economic success came only after European peace. Relative to its size, in the mid-eighteenth-century St. Kitts was the richest British colony and a place where sugar was indeed king.

St. Kitts was visited by the English in 1585 and 1622, but, like the Spanish before them, they were discouraged by the determined resistance of the native Carib Indians in that area. In 1624, Sir Thomas Warner formed a tobacco colony in St. Kitts, diverting the Caribs with a combination of treaty and treachery. The need to defeat the Caribs and fend off a Spanish attack in 1629 required the English to cooperate with the French, who had occupied the northern and southern ends of St. Kitts in 1625. This left French Saint Christopher with the better harbor at Basseterre and the English with the best farmland. Once these hostilities had ended, offshoot settlements from St. Kitts developed rapidly in Nevis, Montserrat, and Antigua, with labor provided by English and Irish indentured servants.

When the value of tobacco declined during the 1630s, a period of attempted agricultural diversification slowly gave way to the cultivation of sugar cane. The process took time, as capital was scarce and waited on the development of both local government institutions and local land ownership (rather than tenancy), both of which encouraged investment in plantations and increasingly in African slaves.

The joint occupation was problematic, however; disruptive warfare meant enormous losses in goods and laborers for planters. The English lost the island to the French in 1666, 1689, and 1706, before securing sole control under the Treaty of Utrecht in 1713. The peace brought new investment, and half of the French land went to Scottish planters and investors.

In 1687, Dr. Hans Sloane wrote that the English in St. Kitts were healthier than those on other islands, owing to the cooler temperature, although four yellow fever epidemics between 1648 and 1793 took their toll. In 1678, the white population was 1,897; it had risen to only 2,377 by 1745 and dropped to 1,900 in 1774. In contrast, the black population rose from 1,436 in 1678 to 19,174 in 1745 and 23,462 in 1774, with most of the gain coming after the 1720s. Unlike the male-dominated early days, by 1678, there were nearly equal numbers of men and women in both the black and white populations. The growth and stability of St. Kitts was reflected in sugar exports, which increased from less than 1,000 tons in the 1600s, to 4,437 tons in 1725 and to 8,789 tons by 1748.

The rise of the plantation system and sugar monoculture made St. Kitts dependent on external sources of food and supplies, as well as on slave labor. It also forced out white small farmers as estates were enlarged. The dominant planter elite modeled their social and cultural behaviors on London. In general, they did not develop strong local creole identities or sympathies, as their counterparts did in America, though poorer whites often did.

Brimstone Hill Fortress, located atop a volcanic peak on the island of St. Kitts, was one of the largest colonial military enclaves in the Caribbean. In 1782,

Used to having a powerful commercial lobby in London, the Leeward Island planters protested against the Stamp Act of 1765, complaining that it was inexpedient (rather than unconstitutional) because of their dependence on now-disrupted American trade. There was little chance the British West Indian colonies would join the rebel Americans, though, because of elite cultural affinities with Britain and the islands' dependence on British capital, markets, and protection from foreign threat and slave revolt.

For the planters of the Leeward Islands, the American Revolution brought shortages of food and supplies and indebtedness. The war ruinously disrupted commercial relations both legal and illegal. With the Royal Navy hindered by the loss of American supply routes and delayed overly long in the capture of Dutch Sint Eustatius, the Count de Grasse, a French admiral, captured St. Kitts, Nevis, and Montserrat early in 1782. While the planters in each place capitulated quickly, in St. Kitts they did nothing to help the British garrison fighting in their defense, the planters being furious over the trade losses they suffered with Sint Eustatius's capture and wary of damage to their estates.

At the end of the war, planters in St. Kitts tried to rebuild trade on the old terms but were denied by Britain. A series of hurricanes between 1780 and 1786, disruptions in the French colonies, and the inadequacy of supplies from Canada, however, meant that renewed trade by the British West Indies with the United States was both essential and inevitable.

St. Lawrence River

The St. Lawrence River runs more than 600 miles from its source in the Great Lakes to the Gulf of St. Lawrence and the Atlantic Ocean. The river was the site of early French-Native American interaction in the sixteenth and seventeenth centuries, and eventually the St. Lawrence River Valley became home to the government of New France.

In the worldwide conflict of the Seven Years' War (known in North America as the French and Indian War), the St. Lawrence was pivotal in the massive struggle for control of the continent. France lost its grip on the river, and the ultimate result was the removal of the French as a colonizing power in North America.

In the sixteenth century, the St. Lawrence was home to large towns of Iroquoian-speaking Native Americans. The Iroquois sustained such large settlements, because they hunted and gathered to supplement their agricultural production. In 1541, Jacques Cartier attempted to found a settlement on the river. This early colonial venture was marked by mistrust between the French and their Iroquois hosts, biting cold, and disease. The colony failed miserably.

French, Basque, English, and Portuguese fishermen and traders, who explored the area, discovered the two items that would eventually drive the colonization of the St. Lawrence and Great Lakes region: beaver pelts and fish. In the meantime, the increasing presence of the French upset the delicate native political balance. The Huron and Algonquin peoples allied themselves with the French against the Five Nations Iroquois, and the Iroquois, armed by the Dutch in the Hudson Valley, attacked the French and their allies. The fur trade, driven by the beaver hat rage in Europe, also placed pressure on native communities, which began to range farther from their traditional hunting grounds to satisfy European traders' seemingly endless demand.

In 1608, Samuel de Champlain founded the colony of New France at Quebec. This and other French settlements established in the early years of the seventeenth century tended to be all-male endeavors. The St. Lawrence was frozen for nearly six months of the year, and the region had a limited growing season for crops, but it did offer access to the vast interior and high-quality furs. The French and their Native American neighbors embarked on a campaign against the Iroquois, which, though militarily successful, resulted in the destruction and dispersal of the Huron villages when the Five Nations retaliated later in the 1640s and 1650s.

In 1663, the French Crown assumed control of Canada from the Company of New France, a fur-trading enterprise, and large-scale colonization got off to a slow start. The activities in which the company engaged did not require a large settler population. Also, there were not as many economic "push" factors driving French men and women to Canada as there were for the English settlers farther south, as France was not undergoing the same dramatic commercialization of the countryside.

In the 1660s, the French population of New France was only 3,000, while the population of New England and the Chesapeake topped 85,000. Its

development subsidized by the Crown, Canada began to grow, although many indentured servants brought there returned to France when their indentures were up.

Canada remained primarily a trading venture, although agricultural exports helped local farmers. Nominal French control of the interior of North America branched out from a narrow base along the St. Lawrence River from Quebec to Montreal. The French, not primarily interested in settlement, allied themselves with a network of native traders that stretched out along the river systems of the Midwest.

The French hold on the St. Lawrence River Valley was tenuous, but that fact did not prevent them from attempting a massive reorganization of their empire in the 1750s. This project brought the French into conflict with the populous, aggressively expansionist Anglo-Americans in the Ohio River Valley, with devastating results for French rule in Canada.

In 1758, a huge British fleet captured the fortress at Louisbourg, which protected the mouth of the St. Lawrence. In 1759, General James Wolfe faced Louis-Joseph de Montcalm, a French general, on the Plains of Abraham, outside Quebec. After a brief battle, the French broke ranks and retreated to Quebec. Both commanders died in the battle, and Quebec fell shortly thereafter. In 1760, Montreal suffered a similar fate.

The French and Indian War resulted in France's final abandonment of the St. Lawrence River Valley. In the aftermath of the war, the British were particularly cruel to the inhabitants of Acadia, forcing their evacuation. When Britain's other mainland colonies broke away in 1776, Canada remained part of the British Empire.

St. Louis

Named in honor of King Louis IX, St. Louis was first established as a fur trading post by Pierre Laclède, a member of Mexent & Laclède Fur Company, and Auguste Chouteau, his 13-year-old associate, in 1764. The site they selected was ideal: 18 miles south of the confluence of the Mississippi and Missouri Rivers. It had both river access and a bluff to protect it from the river's flooding.

While Laclède returned to New Orleans, Auguste began construction of the small village. A year later, Laclède returned to St. Louis with Auguste's mother, Marie Chouteau, and her three children. The primitive settlement consisted of little more than two granaries, a bakery, a maple sugar works, and a church. But St. Louis grew quickly, as its location served to make it the "gateway" city for the ever-increasing north-south commerce that traveled the Mississippi River.

In 1768, the Spanish built a fort on the nearby banks of the Missouri River. This was replaced in 1780 with Fort San Carlos and other fortifications within St. Louis. During the American War for Independence, the city came under attack by the British with allied natives. In the only Revolutionary battle fought west of the Mississippi, outnumbered Spanish troops under Governor Fernando de Leyba, along with colonial militia and slaves, succeeded in defending the city.

By the time of the Louisiana Purchase in 1803, St. Louis had grown to more than 1,100 people and had become a bustling river landing. When President Thomas Jefferson appointed Meriwether Lewis and William Clark to lead the expedition that would explore the territory, St. Louis was the jumping-off point.

When the explorers returned to St. Louis on September 23, 1806, they had completed a journey of 7,689 miles. Clearly, St. Louis was the link connecting the eastern and western halves of the country. Moreover, Lewis and Clark's extensive observations and descriptions of the animals they had seen, in particular the vast numbers of beaver and muskrat, spurred the flow of trappers to the region. As a result, St. Louis became the most important stop for traders and trappers alike.

In 1817, steamboats replaced keelboats as a more efficient mode of transportation, and, to keep up with the traffic, stone wharves and warehouses had to be built. Politically St. Louis became a hotbed of dissension: the French, whose claims to the region dated to the 1680s, resented the newcomers. Disagreements over land titles and mining claims arose. Hunters and squatters, disregarding treaties with the Native Americans, moved onto the natives' lands. In addition, traders resented the increased number of federal regulations being placed on trade with the native peoples.

Regardless of the tension, however, St. Louis was a market city of importance in and well beyond the colonial period. Large boats docked at its wharves, while smaller vessels navigated the shallower stretches of river with their loads of grain, lumber, furs, and salt pork.

In 1849, with the California gold rush, came the miners and emigrants, bent on crossing the plains as quickly as possible. St. Louis was once again the gateway city, providing the starting point for many headed to the West. Unfortunately, that same year, cholera, arriving with the emigrants, spread through the city, killing hundreds. Then, a steamboat exploded while docked at one of the crowded levees and fire spread to the center of the city. Before the fires were extinguished, more than a dozen blocks of city buildings were destroyed. One of the few buildings to survive the fire was the Old Cathedral, which had been built on the original site of the first church. But St. Louis quickly rebuilt, this time with brick and iron rather than wood. The city was destined to become a major manufacturing center, host to the World's Fair and the Olympic Games in 1904, site of the nation's first gasoline station, and the future home of Fortune 500 companies.

Even in its infancy, fur trader and entrepreneur Pierre Laclede foresaw the success St. Louis would experience. In his journal of 1763, he wrote, "I have found a situation where I am going to form a settlement which might become hereafter one of the finest cities in America."

Stamp Act (1765)

Faced with the costly aftermath of the French and Indian War in North America, the members of the ministry of Prime Minister George Grenville were extremely concerned about the enormous British national debt. This amount strained the ability of the Crown to lay any further tax on the British Isles without risking violent protest.

By 1764, efforts to raise revenues through the tightening of existing customs regulation and the Sugar Act had been unsuccessful. British documents and newspapers had carried stamps since 1689, and the tax had been a reliable source of revenue for the government. The delegates to the Albany Congress of 1754 had even considered a stamp tax to finance their plan of union.

Grenville had probably been considering a Stamp Act in the American colonies since 1763. He proposed it to the House of Commons on March 9, 1764, primarily so that Parliament could affirm its ability to tax the colonies. He stipulated, however, that the colonies had a year in which to propose an alternate source of revenue. This offer to the colonies of finding a means to tax themselves was immediately suspect, as colonial agents could not get Grenville to give them any solid procedure by which they could offer such plans or have them approved. Meanwhile, the Earl of Halifax, as secretary of state for the South, surveyed the colonial governors via a circular letter, inquiring about the many documents that might need to carry a stamp.

Although the colonists protested through their agents, including Benjamin Franklin, there was little organized resistance by the time the measure came to the House of Commons in February 1765. Drafted by Thomas Waltey of the Treasury, the schedule of stamp duties covered all printed material and legal documents, including playing cards, newspapers, diplomas, and ship clearances. The fees were generally far lower than those that residents of England already paid, with the exception of the fees for matriculation certificates and professional *bona fides*, with the purpose of discouraging lower-class Americans from gaining them.

Stamp Act Demonstrations, 1765. Historians cite the widespread demonstrations throughout the colonies against the Stamp Act, a British law imposing fees on a host of commodities and services. These demonstrations mark the beginning of organized colonial opposition to British rule. (Carto-Graphics)

Members of the House of Commons voiced no dissent on their right to tax in this manner, although two members, Colonel Isaac Barré and General Henry Conway, protested the tax as unjust and a hardship for the colonies. Barré's speech gave rise to the phrase "Sons of Liberty." After refusing to hear colonial petitions against the measure, the House passed the fifty-five resolutions of the Stamp Act on February 7, 1765, and decreed that the act would take effect on November 1, 1765.

In the colonies, reactions were extremely negative. Pamphlets, most famously Daniel Dulany, Jr.'s *Considerations on the Propriety of Imposing Taxes*, attacked the House of Commons for taxation without representation. Grenville answered with "virtual representation," that is, he maintained that colonists were represented by Parliament as a whole.

In May, Virginia's House of Burgesses voted a resolution against the measure, and Rhode Island passed laws allowing civil servants to disregard the requirements for stamps. Massachusetts began a circular letter of protest in June, inviting all the colonies to send delegates to a Stamp Act Congress in New York to plan a course of action. Colonists resented not just the tax itself, but also the fact that the stamps had to be paid for in cash, a situation that pinched those not living in the population centers, who primarily dealt in a barter economy. Additionally, many saw the tax on printed material to be a measure meant to promote censorship.

Representatives of nine of thirteen colonies attended the New York meeting in October 1765; Virginia, New Hampshire, North Carolina, and Georgia did not send delegates. Canadian colonies and the Caribbean islands declined to participate in the protest. Despite voting that the House of Commons had the right to legislate for the colonies, the delegates denied it the right to tax. Although bold, this means of defiance meant little when royal officials in America planned to use the stamps, even if colonial subjects didn't.

A more violent response came from the Sons of Liberty. Formed in Boston the summer of 1765, this group's name and organization spread throughout the colonies by August, when it began terrorizing distributors of the stamps. Using mob action, the Sons of Liberty burned officials in effigy, assaulted them and looted their houses, and intimidated men in every colony into resigning their commissions to distribute the stamps. These activities were particularly disruptive in Boston, where the governor had to take refuge in Castle William, a fort on an island in Massachusetts Bay.

When the Stamp Act went into effect on November 1, there was no one willing to distribute the stamps, and the Sons of Liberty forced higher colonial courts to function without stamps. Planning ahead, merchants sent their ships out before November. In the short term, stopping colonial trade hurt the

By July 1765, Grenville's government had fallen, and it was replaced by one led by the Marquis of Rockingham. He disliked the Stamp Act and was willing to consider repeal. Under continued lobbying from London merchants and colonial agents, as well as testimony from military experts about the slim chances of enforcing the act short of a military occupation, the House of Commons repealed it on February 21, 1766. Rockingham, however, paired the repeal with the passing of the Declaratory Act, reserving Parliament's right to tax the American colonies.

Stuyvesant, Peter (c. 1610–1672)

Peter Stuyvesant ruled the Dutch colony of New Netherland as director-general or governor from 1647 until 1664, when England seized the colony and renamed it New York. Born about 1610, Stuyvesant was intensely loyal to the Dutch West India Company, which employed him, and he was a devout member of the Dutch Reformed Church. He directed the company's holdings on Curaçao from 1638 until 1646.

In 1644, a cannonball crushed his right leg during an assault on the Spanish colony of St. Martin. Enduring intense pain, Stuyvesant continued the assault for twenty-eight days but ultimately withdrew due to a lack of support from his men. Surgeons amputated the leg, and Stuyvesant wore a wooden leg thereafter.

Arrival in New Amsterdam

In 1647, Stuyvesant arrived in New Amsterdam as the West India Company's director-general of New Netherland. He faced a very diverse population in the colony, as it had drawn settlers from different regions of Europe—France, Belgium, Germany, and Scandinavia. Further, the company had shipped African slaves to the region since 1626; some of these Africans had gained their independence, giving New Netherland a sizable free black population. Several Native American groups also resided along the Hudson River, notably the Mohawk and several Algonquin tribes.

Conflict dominated Stuyvesant's tenure in New Netherland. His authoritarian ways upset many, but he did effect significant changes in the colony. The colonists disagreed with the taxes he imposed and wanted greater political participation. Company officers in Holland disagreed with his intolerant religious views. Rensselaerswyck, a prosperous community on the upper Hudson, resented Stuyvesant's attempts to increase the company's control of that region's trade in beaver fur.

Much of the tension between the colonists and the director sprang from the lack of political authority in New Netherland towns. Dutch charters did not allow popular political participation, in stark contrast to the English communities of New England. As the population of the English colonies grew, some of these colonists settled on the north shore of Long Island, and they insisted on town meetings and voting rights similar to those in New England. Stuyvesant held few elections in New Netherland. Incumbent local officials nominated their successors to the director, who made the final selection.

In 1649, several New Amsterdam residents, calling themselves the Nine Men, made formal complaint about Stuyvesant's opposition to local control. The company ordered him to create a New Amsterdam Court of Justice. He did so in 1653, but disallowed popular elections, instead appointing men to this body.

Stuyvesant also strengthened the position of social elites in the colony, when he created greater and lesser burgher rights. The former applied to those who held high civil, military, or ecclesiastical offices and to settlers who paid 50 guilders (approximately 20 dollars). Lesser burgher rights went to those born in the city, those who had lived there for eighteen years, and merchants who paid a fee of 20 guilders to the company. Only those possessing greater burgher rights were eligible for public office.

Stuyvesant initiated several reforms and increased the regulation of New Netherland. He revised fencing laws to reduce property damage by livestock. He enacted strict fire codes and appointed fire wardens to inspect poorly built chimneys. He enforced existing laws against selling liquor to the native peoples and made certain that settlers promptly paid natives for services rendered. He enforced smuggling laws and imposed an excise tax on imported liquor to pay for repairs to Fort New Amsterdam.

Peter Stuyvesant was the last governor of the Dutch colony of New Netherland (later New York), to 1664. Stuyvesant's right limb had been shattered by a cannonball years earlier, and he wore a wooden leg, which he ringed with bands of silver, earning him the nickname "Old Silver Leg." (Brown Brothers, Sterling, Pennsylvania)

To reduce food shortages and raise revenue, he created price controls on bread and required permits to slaughter animals for meat. He also imposed controls on alcohol production in the colony and created laws to discourage excessive consumption. He closed all taverns at 9 p.m. and imposed stiff penalties for Sunday drinking and knife fighting. He even ordered drivers to walk their wagons through New Amsterdam streets to reduce the danger to pedestrians.

In 1658, he established the Rattle Watch, a rudimentary police force of nine men who patrolled New Amsterdam and pursued criminals. Each carried a rattle or a wooden clapper to sound the alarm. Stuyvesant also established primary schools in several communities, including Brooklyn, Flatbush, and Harlem.

Stuyvesant, then, greatly increased the regulation of economic and social activity. The West India Company ended its monopoly of trade in the colony in 1647, however, and company officers often negated his decrees when colonists complained.

Stuyvesant and Religion

True to his religious convictions, Stuyvesant required attendance at Sunday religious services. The director's strict adherence to the Dutch Reformed Church created friction with colonists and company officers.

In 1652, the director attempted to prohibit Quakers and Anabaptists from preaching in the colony. Two years later, he refused Lutheran settlers' request to bring a Lutheran minister to New Netherland. Receiving complaints about the director's obstinate behavior, company officials informed Stuyvesant that they supported his position but urged him to exercise leniency toward nonbelievers. When a group of Jewish settlers located in New Netherland in 1654, Stuyvesant sought to ban them from the colony. The company rejected his request and ultimately adopted a policy of religious freedom.

Stuyvesant engaged in considerable military activity as director. In 1654, the governor of New Sweden seized the Dutch Fort Casimir on the Delaware River. Stuyvesant, preoccupied with rising hostilities between New Netherland and New England, did not respond until the following year, when he led a force of 600 men against the Swedes. The 400 outnumbered Swedish settlers surrendered and agreed to Dutch rule.

While Stuyvesant was absent from New Amsterdam, a war party of 1,900 Algonquins passed through New Amsterdam, seeking to attack rival native groups at the eastern end of Long Island. They stopped on Manhattan Island and rested in Hendrick van Dyck's peach orchard. Inexplicably, van Dyck shot a native woman and so enraged the Algonquin that they redirected their enmity toward the Dutch, and the Peach War ensued.

The Native Americans moved throughout New Amsterdam, breaking into houses and setting some buildings afire in a search for van Dyck. The chiefs attempted to calm the situation, but the colonists, emboldened by liquor, attacked the natives and drove them from the city. In the following days, the Algonquin burned and pillaged settlements along the Hudson, taking survivors as hostages. Stuyvesant hurried back to lead the Dutch forces against the natives. By the war's end later that year, fifty colonists and approximately sixty Native Americans were dead, five hundred head of cattle were missing, and thousands of bushels of corn had been destroyed.

To guard against future attacks, Stuyvesant banned the creation of outlying settlements, banned Native Americans from New Amsterdam at night, and called for corporal punishment of those selling liquor to the native peoples. These measures ended native attacks on New Amsterdam, but such conflicts continued in other Dutch communities. The colonists fought wars with the natives from 1659 to 1660 and from 1663 to 1664.

Tensions between New Netherland and New England had grown steadily as their settlements expanded. In 1650, Stuyvesant signed an agreement that placed the border between the two colonies at a line 10 miles east of the Hudson River. Although this line was generous to New England, English settlers soon began to move across it.

England and the Netherlands went to war from 1652 until 1654 and again in 1660. These conflicts further increased hostilities between the colonies.

In 1664, English King Charles II, ignoring Dutch claims to New Netherland, granted all land between the Connecticut and Delaware rivers to his brother, James, Duke of York. James assembled an invasion fleet of four ships, which put into Gravesend Bay at the mouth of the Hudson River late in August 1664. Stuyvesant sent a messenger out to learn of their intentions. Colonel Richard Nicolls, the English commander, demanded the surrender of New Amsterdam.

Stuyvesant called for the defense of the city but received no support from the populace. They had grown weary of his authoritarian rule and held little loyalty to the West India Company or to the Dutch government. Their greatest concern was commerce and, once informed that Nicolls would allow them to retain their political and property rights, they agreed to surrender. Dominie Megapolensis, the colony's leading Dutch Reformed cleric, went to Stuyvesant and convinced him that capitulation was the best option.

On September 8, 1664, the Dutch soldiers marched out of the fort, the English marched in, and New Netherland became the English colony of New York. The English government assumed the company's administrative duties, and Nicolls replaced Stuyvesant as governor. The company directors recalled Stuyvesant to Amsterdam in 1665 to explain his failure to defend the colony. By that time, the Dutch government had become disenchanted with the company's mismanagement and discounted its charges against Stuyvesant.

Stuyvesant became amenable to English rule, and he continued to live in New Amsterdam, now renamed New York City; Governor Nicolls sought advice from him regularly. Despite his injury in 1644, Stuyvesant remained in good physical condition until his death in 1672. He was buried on Manhattan Island in the chapel he had built on his farm a decade earlier.

Sugar

Sugar was the most important commodity of the Atlantic trade in colonial times. The art of sugar making was first known in India and Persia, the first written evidence dating from 500 c.e. By the time of the Arabian expansion in the seventh century, sugar cultivation spread on the Mediterranean coast, but consumption and even knowledge of it remained extremely rare in most parts of Europe until the time of the Crusades in the twelfth century. Then, however, sugar became an inevitable part of European diet and nutrition culture—as medicine, spice, decorative material, sweetener, and, finally, as a staple food.

At first limited by its price to the aristocracy and even then reserved for special occasions, it became available to the lower classes and was consumed in ever larger quantities over the course of the centuries. Until the utilization of the sugar beet in the nineteenth century, sugar could only be extracted from the sugar cane; therefore, this ever-increasing European consumption depended on non-European production.

To compensate for the decreasing Arabian production in the Mediterranean, the cultivation of sugar cane was introduced to Atlantic islands near Europe in the fifteenth century, when the Portuguese captured São Tomé and the Spanish occupied the Canary Islands.

Although the bullion trade became the primary objective of Iberian economic activities in the Americas after 1492, the suitable climate of the newly seized colonies also led to an expansion of sugar cane cultivation. Early attempts by the Spanish bogged down, but the introduction of the crop to Portuguese Brazil proved very successful. Brazil outstripped the production of the Atlantic islands and the Mediterranean to become the main producer of sugar in the sixteenth century.

Turning sugar cane into sugar is a highly integrated and labor-intensive process. By immediately milling the chopped cane, juice is extracted and then immediately boiled in order to reduce it. Reaching supersaturation, sucrose crystallizes, leaving residual juice, so-called molasses. The crystals can be

further refined to attain different types and qualities of sugar; from the molasses, rum can be distilled. The need for an instant, frictionless procedure was the reason for combining the growing and processing on a single site and for relying on easy-to-direct coerced labor. Hence the slave labor-based colonial plantation system was developed by the Europeans only to handle the sugar production.

Yet the Brazilian plantation economy was not fully developed until the occupation by the Dutch West India Company in the 1630s and 1640s. The Dutch overcame the commercial imperfections of the system by providing economically adequate imports of slaves and building up trading networks to connect the production firmly with the European markets of consumption. The annual sugar output reached 23,000 tons around 1640.

The success of the Dutch inspired English planters to build up sugar plantations in Barbados. Relying on Dutch commercial know-how, a nearly complete transition of the island's economy was accomplished in just a few years, around the 1650s. Output doubled between 1651 and 1655 to nearly 8,000 tons.

This remarkable development is known as the "sugar revolution," and the result exemplified a new type of colonial business. It marks the transition from the so-called First Atlantic System—an Atlantic economy created by Spain and Portugal, focusing on the South American mainland, state-dominated, and devoted mainly to the transfer of bullion, with only a secondary interest in plantations—to the more capital-intense Second Atlantic System—created by the Netherlands, England, and France, dominated by market-orientated private merchants, and focusing on Caribbean plantation colonies to supply Europe with tropical crops.

In this new economy, sugar production has remained far more important than the growing of other crops such as coffee and indigo, even until today. For decades, the English colonies led the market with an annual output of about 20,000 tons around 1700 and 40,000 tons in the 1730s and 1740s. The share of Barbados decreased in favor of the northern Leeward Islands, mainly Jamaica. The French grew 10,000 to 20,000 tons at the beginning of the eighteenth century and, expanding cultivation on Saint-Domingue and overtaking Britain, 75,000 tons around 1760. By 1800, all Caribbean islands together delivered about 250,000 tons of sugar annually, nearly all of it consumed in Europe.

Cuba, which had provided a considerable share of the sugar crop since the late 1770s, contributed about 30,000 tons to the total. But when Saint-Domingue left the world market after gaining its independence in 1804, the Spanish colony of Cuba was the only remaining larger Caribbean island determined to enforce slave labor. The fact that Cuba then gained undisputed market leadership within just three decades shows the tight and reciprocal connection between preindustrial sugar production and the exploitation of slave labor.

Sugar Act (1764)

The Sugar Act of 1764, also known as the Plantation Act and American Revenue Act, replaced the Molasses Act of 1733, which had proven ineffective in raising needed revenue for the British Empire. In contrast to its predecessor, the Sugar Act contained strict enforcement guidelines. Also, unlike previous taxation attempts, the Sugar Act, for the first time, taxed the colonies directly. Consequently, the passage of the Sugar Act (and the later Stamp Act) led to widespread protests in Colonial America.

Great Britain's victory in the French and Indian War (known as the Seven Years' War in Europe) had both costs and benefits for the empire. On the one hand, the French defeat allowed Britain to claim new territory in North America. On the other, great financial resources were consumed during the war, which had almost doubled Britain's national debt. Furthermore, maintaining the new lands required a continued and considerable expense. Consequently, taxation seemed an attractive solution to King George III and his advisers.

Taking charge of the king's financial affairs in April 1763, First Lord of the Treasury George Grenville began an investigation into the American customs service; he found that corruption and smuggling had rendered it extremely inefficient. For decades, the Molasses Act had been ignored by the colonists, and the British government had made little effort to enforce it. In an attempt to rectify the situation, Grenville replaced many customs agents, issued stern orders to colonial officials, and sent the British navy to patrol the coasts.

Once effective measures for enforcement were in place, however, Grenville began to question the amount of the tax. Aware that molasses was imported to the colonies in great quantities by rum distillers, Grenville feared that if it were enforced, the existing Molasses Act, which charged a duty of sixpence per gallon of molasses, would place an unbearable burden on the colonists. For this reason, Grenville abolished the Molasses Act and replaced it with the Sugar Act, which cut the duty on molasses in half but raised the tax on sugar and added a duty on Madeira wine.

Furthermore, under the Sugar Act, cargo had to be bonded before it was loaded on a ship. If a customs agent discovered unbonded products, he had the right to seize the goods and the ship. This provision led to the seizure of colonial ships, including the *Liberty*, which was owned by John Hancock, and the *Ann*, which was owned by Henry Laurens.

The colonists immediately questioned the validity of the Sugar Act. Traditionally, the colonists had not questioned Parliament's power to regulate trade for the benefit of the mother country. However, since the colonists had always taxed themselves, they viewed the new policy of direct taxation as an overstepping of parliamentary power. Public protests began, and the political slogan "no taxation without representation," became popular. Many colonial leaders opposed the tightening of British control over the colonies and sent letters of protest, which, for the most part, went unheeded. Widespread outrage over the controversial new tax and a perceived lack of political power led to unifying movements throughout most of the colonies.

As a form of protest against the Sugar Act, the later Stamp Act, and other tax measures, a boycott of all British goods was enforced in Boston, Philadelphia, and New York. For the next few years, colonists brewed native sage and sassafras and abstained from British tea. They wore homemade clothing instead of British fashions.

By 1766, the effects of the boycott began to take hold in Britain, and British businessmen began to plead with Parliament for relief. During this time, the king fired Grenville over an issue of office appointments and replaced him with the Marquis of Rockingham. Rockingham, who was more sympathetic to the views of the colonists than Grenville, responded by persuading Parliament to repeal the Stamp Act and lower the sugar tax from 3 pence to 1.

Ironically, the revenue collected under the Sugar Act contributed considerably less than 1 percent to the British annual budget. Yet, it was an extremely significant measure, since it was the first of a long line of new tax measures that ultimately led to colonial rebellion, the Revolution, and finally American independence.

Susquehanna

Running through central Pennsylvania, the colonial Susquehanna River Valley lay between the Delaware River Valley to the east, the land of the Iroquois and New York to the north, and the Ohio Valley and the Great Lakes region to the west. Pennsylvania and Iroquois officials recognized the great commercial and strategic value of a region that bordered so many different colonies and empires, and shared control of it through the 1750s. Both encouraged numerous groups of Europeans and Native Americans to settle in the Susquehanna, and Iroquois and Pennsylvania officials promoted trade, accommodation, and peace between the groups who settled there. After 1750, however, this long but fragile peace fell apart. The region plunged into two decades of war that ultimately drove the Susquehanna's indigenous peoples into the Ohio Country, opening the entire valley to settlement by European Americans.

In the early 1600s, upwards of 6,000 Susquehannocks, whom John Smith called a "great" and "well proportioned" people, controlled the Susquehanna Valley. But in the 1660s, Iroquois warriors launched mourning wars (wars to obtain captives to replace dead kin) against the Susquehannock after they had spurned the Iroquois's overtures to join their confederacy. Within two decades, the valley was devoid of human settlement except in the far lower reaches.

When William Penn established Pennsylvania in 1682, he immediately laid plans to extend his patent to the lower Susquehanna Valley. At the same time, the Iroquois who lived north of the Susquehanna Valley hoped to resettle the area with dependent native nations that would serve as a buffer, protecting them from colonists in New York and their native enemies, the Cherokee and Catawba. Pennsylvania similarly encouraged displaced Native Americans to resettle the region, hoping to profit from the fur trade, and to establish a barrier between the settlements on the Delaware River and the French and Native Americans to the west.

Pennsylvania and the Iroquois agreed to share control of the Susquehanna Valley, formalizing their alliance in treaties signed in 1701 and 1736. The Pennsylvania government assumed responsibility for European settlers, missionaries, and traders, and the Iroquois claimed the exclusive right to speak for the various native tribes and nations who settled there. A host of displaced native peoples—the Delaware, surviving Susquehannocks, the Shawnee who had retreated to the Ohio Country, displaced Chesapeake tribes like the Conoy, displaced New England tribes like the Mahican, and a host of smaller

bands—settled in the Susquehanna Valley under the auspices of the Iroquois and Pennsylvania. In the 1720s, European settlers, mainly German Protestants and Scottish and Irish Presbyterians, began establishing farms and settlements in the lower Susquehanna Valley.

Historians have long noted the importance of diversity in colonial Pennsylvania, and the Susquehanna Valley was its most diverse part. Routine meetings to settle issues of trade and land trade might involve representatives from a dozen Native American nations, mediators and negotiators from Pennsylvania and Iroquois nations, and scores of missionaries, traders, interlopers, and transients. Often, these meetings would be conducted in five or six languages. At one 1753 meeting, a Shawnee spoke, a Nanticoke translated his words into English, a German missionary then translated the English into German, and two Native Americans then translated the German into Delaware and Mahican. Meanwhile, an official acting for the Iroquois and the Pennsylvania government, versed in any number of languages, silently observed to ensure that the proceedings accorded with their interests.

Conflicting interests, dislike, and distrust often threatened to produce violence between Native Americans and European settlers. But the diverse peoples of the Susquehanna Valley had shared interests, too, and Iroquois and Pennsylvania officials worked hard to remind them that peace and trade benefited all. Through the 1750s, Pennsylvania and Iroquois negotiators maintained a carefully constructed peace, largely freeing the Susquehanna Valley from the wars and violence that plagued so many other frontiers in British North America.

By the 1750s, however, these negotiators found it increasingly difficult to contain the distrust that had long simmered between native peoples and Europeans. When the French and Indian War spilled over from the Ohio Valley in 1756, the entire region descended into war and chaos. In the 1760s, Ohio and Susquehanna natives joined Pontiac's Rebellion in an effort to push back white settlement.

In the 1770s, the American War for Independence brought another round of war. Much like the Iroquois mourning wars of the 1660s and 1670s, the Revolutionary War ravaged the upper Susquehanna Valley, again leaving it largely devoid of human settlement.

In the 1780s, American land speculators and settlers moved in. Unlike their predecessors, they did not invite the region's displaced Native American nations to join them.

Swedes

The early 1600s was a time when Sweden was a world power, whose troops had fought successfully in Germany, Poland, the Baltic, Russia, and Denmark. Inspired by the riches garnered by other European powers from their overseas colonies, Sweden also wanted to spread its influence to the New World. In 1637, Swedish, Dutch, and German stockholders formed an alliance—the New Sweden Company—whose primary purpose was to capitalize on the fur and tobacco trade in North America. It was the responsibility of the company to replenish the royal treasury with riches from beyond the Atlantic.

Peter Minuit approached Sweden with stories of treasures to be found in the New World and touted his success at establishing Dutch colonies. He was not a novice colonizer, as he had struggled for seven years to make Dutch New Netherland a profitable fur trading and farming center. After those years of struggle, he was replaced and returned home, leaving behind his only significant act, that of purchasing Manhattan Island for an estimated 24 dollars worth of trinkets.

Minuit and Samuel Blommaert, a copper and brass merchant from Amsterdam, had bought some land in the Delaware Valley. After several unsuccessful attempts to convince the Dutch to form a new settlement on the Delaware, Minuit traveled to Sweden and, using his persuasive skills, was hired to start Sweden's new colony. Toward the end of 1637, the company's first expedition, led by Minuit, sailed from Sweden in two ships, the *Kalmar Nyckel* and the *Fogel Grip*.

At its peak in 1654, the New Sweden colony dominated the territory along 60 miles of the Delaware River in what is now New Jersey, Pennsylvania, and Delaware (southeast at top). The Dutch took control the following year. (Brown Brothers, Sterling, Pennsylvania)

After a rough and seemingly interminable crossing, these two ships reached the Delaware River in early 1638. At the mouth of the Brandywine Creek, the first Swedish colonists established Fort Christina, named in honor of the Swedish queen. With the backing of Dutch merchants, Sweden, itself a powerful and prosperous European nation, founded New Sweden on the west bank of the Delaware River.

Much like Fort Orange on the Hudson, Fort Christina specialized in fur trading with the native peoples. Because the trading post lost money, the Dutch investors lost interest and sold their part of the company to their Swedish partners and the Swedish Crown.

The company was reorganized in 1643 and dispatched farm families to raise provisions, livestock, and tobacco. Some of the families were Swedes, but most came from Finland, then under Swedish rule. Highly skilled at farming in heavily forested Sweden and Finland, the colonists adapted quickly, introducing some frontier techniques that became classically "American," including the construction of log cabins. The log cabin became a legacy that played an important role in American life for over 200 years.

Since they were so few in number—roughly 300 to 400 men, women, and children—the New Sweden colonists were unable to defend the land when violently confronted by their Dutch neighbors. In September 1655, the Dutch governor, Peter Stuyvesant, appeared with seven warships and more than 300 armed men. Bribed by the Dutch, the Swedish commander quickly surrendered himself and left by ship for home. Most of the colonists remained and accepted Dutch rule.

For over ten years, the Delaware settlements grew modestly to about 500 colonists, as new Dutch settlers joined the Swedes and Finns. This was still not enough, as the colony had become stretched too thin to hold both the Delaware and the Hudson against the English.

Syphilis

In the colonial era, syphilis was also known as the French disease, the French pox, the Spanish disease, and yaws. Archaeological evidence suggests that Native Americans suffered from syphilis prior to Columbus's voyage, and fifteenth-century European sources corroborate these findings. The evidence, however, remains inconclusive, and the origin of syphilis remains one of medicine's unsolved mysteries.

Forms of endemic syphilis may have existed in Europe prior to 1492. Syphilis, however, was most likely unknown in the Old World before that time, for contemporaries discussed it as a new disease; once it appeared, it spread virulently throughout Europe, Africa, and parts of Asia.

Soldiers engaged in continental warfare, especially the armies of French King Charles VIII (who died of syphilis in 1498), contributed heavily to its initial European spread. By the early sixteenth century, sailors had carried it to nearly every port city; death frequently followed contraction of the disease in the first half-century of European infection. By the seventeenth century, the disease had lost some of its ferocity and was marked by periodic remission.

Early American colonists often confused two related but distinct diseases caused by *Treponema pallidum*: endemic (nonvenereal) syphilis and venereal syphilis. Endemic syphilis, transferred through fluid mediums such as saliva, was common to rural areas characterized by poor sanitation and close living quarters. In advanced stages, it often caused loss of the nose and palate. Venereal syphilis was—and is—transmitted through genital contact. Syphilis also could be passed from a mother to her unborn child.

Both diseases carried the same symptoms, making diagnosis difficult. Symptoms included fevers, rashes, genital ulcers, ulceration of the mouth and uvula, gummy tumors, lymph gland swelling, bone inflammation, and agonizing muscle pain. No one, however, knew its exact cause, and many confused the disease with gonorrhea. Indeed, over the course of the seventeenth and eighteenth centuries, little progress was made in treating or preventing the spread of the disease.

The disease was fairly widespread among white colonists, slaves, and Native Americans by the eighteenth century. Syphilis was also common among the British, French, and provincial troops, who fought in the many colonial wars, which may have contributed to its spread. By midcentury, more libertine and cosmopolitan men accepted the affliction as a consequence of sexual activity. Colonial newspapers and imported British periodicals carried ads promising “cures” for venereal diseases, as did local surgeons.

Syphilis even became something of an eighteenth-century political joke. Pointed references to syphilis and other venereal diseases, often used to mock or defame political opponents, can be found in both the colonial and English press. Imported broadsides, novels, and prints included references to syphilis in colonial political culture. Colonists, too, used accusations of syphilitic infection to insult local politicians, often insinuating that the afflicted suffered from moral laxity—or a passionate, robust sexual nature.

William Byrd II of Westover, for example, remarked in 1728 in his diary that the disease was so common in North Carolina that “it ceases to be a Scandal.” He sneered that the ruling house of burgesses had made a motion that “a Man with a Nose shou'd be incapable of holding any Place of Profit in the Province.”

Literate eighteenth-century Britons could learn about the disease and its treatment in over 100 published works. Home remedies circulated widely, and colonial treatments were generally harsh and unsuccessful. Mercury was administered most frequently and to the best effect, but its toxicity often led to excessive drooling, loss of hair and teeth, and sometimes death. Other treatments included bleeding, baths, fumigation, and poultices. The most famous American treatment was credited to a Virginia slave named James Papaw, who, in 1729, earned his freedom by making his concoction public.

By the end of the eighteenth century, thanks to advances in the printing of illustrations, syphilis was again a fashionable topic. Medical treatises published in Europe were translated into English and became popular in both England and America, prompting an interest in new clinical research.

While syphilis was treated as something of a laughing matter during the Restoration years, as the century progressed, the disease was no longer cause for laughter. Especially after the French Revolution, syphilis became associated increasingly with women and prostitution, and political commentators used it as a metaphor for moral corruption and a want of public virtue.

Taino

The Taino were the first Amerindians to meet and have sustained contact with Europeans. It was the Taino who watched curiously when Christopher Columbus planted the Spanish flag and dubbed their island San Salvador on October 12, 1492.

Often referred to as Island Arawaks, the Taino's population and cultural core was the island they called Quisqueya, today Hispaniola, shared by the Dominican Republic and Haiti. The Taino also populated Puerto Rico and eastern Cuba, had colonies in the Bahamas and Jamaica, and had established trade routes that extended throughout the Caribbean to Florida and the Yucatán. *Taino* comes from *nitaíno*, which is what they called out when European ships approached, perhaps signifying that they were "nobles," the word's most frequently accepted meaning. It is more likely, however, that they meant that they were not cannibals.

One thing we know for certain is that Taino was *not* a collective name that they used; they identified themselves by individual *yucayeque* (population center) and by *cacicazgo*, the extent of a region under the control of a particular *cacique* (chief). Their languages were significantly different from *cacicazgo* to *cacicazgo* but mutually comprehensible, which has led to the as-yet-unresolved debate whether the Guanahatabey (also called Ciboney) of northeastern Hispaniola and Cuba were a separate people from the Taino. Their agricultural base and techniques of cultivation were slightly different from *cacicazgo* to *cacicazgo*, and designs of both domestic and elite products varied too, but Tainos' spiritual beliefs and practices appear to have been relatively uniform and widespread.

The Taino's most advanced agricultural features arose in western Hispaniola, where they dug irrigation channels, and in the northern valleys, where they constructed fields called *conucos* with knee-high mounds of soil 8 to 9 feet in circumference. Here, they intercropped yucca, beans, squash, peppers, corn, sweet potatoes, peanuts, and other tubers. The *conucos* required only occasional weeding and pest removal, and there was no need to build storage sheds, for the main crop, yucca (also known as *casaba* or *manioc*), could be left in the ground until needed. Cultivated crops, in combination with wild foods and protein gathered from seas, rivers, and lakes, gave the Taino a stable food base, which allowed the populations to expand exponentially—their *yucayeques* averaged 500 to 1,000 inhabitants.

The typical *yucayeque* had many *bohios* (conical straw houses) centered around a *batey* (plaza and playing field), upon which the *cacique's caney* (house/temple) faced. The porch of the *caney* is where the sacred *cohoba* ceremony took place, wherein the *cacique* inhaled hallucinogenic powder that allowed him to communicate with his *zemies*, or spirit guides. The plaza was the site of the Taino's *areitos*, communal song and dance ceremonies, as well as their ballgame, which was both sport and religious ritual.

The Taino in the Boca Chica region of eastern Hispaniola brought pottery making to "a new height of ceramic art ... characterized by elaborate modeled-incised designs, many of which appear to be representations of *zemies*." The term "zemi" (or "cemi") encompassed dual concepts, for it denoted a spiritual double who gave advice and protected humans and was also the physical symbol of that spiritual being. There were thousands of *zemies*, representing the broad pantheon of the Taino's legendary gods and culture heroes, plus deceased ancestors and nature spirits. Just about every object used by the Taino, both utilitarian and ceremonial, was decorated with carvings, paintings, or weavings of the *zemies* and their symbols. Taino wore elaborate jewelry honoring their *zemies* and decorated their bodies with painted-on multicolored *zemi* symbols. Some sported permanent tattoos.

The Taino people, who watched as Columbus landed on Hispaniola in 1492, were the first Amerindians to have sustained contact with Europeans. Caciques (chiefs) wore elaborately embellished costumes and sat on carved ceremonial seats called dujos. (Musee de l'Homme, Paris, France/Bridgeman Art Library)

Spanish chroniclers generally described the Taino as “naked,” but all of them wore jewelry and zemi symbols, leg bands and armbands. Married women wore a cotton loincloth called a *nagua*—the more noble they were, the longer the *nagua*.

Caciques dressed far more elaborately, especially for ceremonial occasions. They had brilliant cotton capes embroidered with parrot feathers; carved gold-and-pearl-embellished masks, crowns, and pendants; and elaborate belts. While all the other Tainos sat on the ground, caciques sat on elaborately carved and polished wooden *dujos* (ceremonial seats). Caciques had elaborately decorated canoes, too, some of which could hold hundreds of people; when on land, caciques were often carried about on litters. Some caciques were buried in caves, which were frequently decorated with petroglyphs and pictographs, or at other prestige burial sites. Their corpses were accompanied by elaborate grave goods, among which might be the buried-alive body of a favorite wife.

Taino cultural development was abruptly halted with the arrival of the Spaniards, Africans, and their animals—all brought along germs and viruses to which the Amerindian peoples had no inbred immunities. Disease combined with exploitation caused a drastic decline in the Taino population. An estimated 90 percent of the original 2 million died within two generations. Today, descendants of those Tainos who survived are attempting to make a comeback.

Taylor, Edward (c. 1644–1729)

Edward Taylor has been called America's first important poet—though many scholars would give this title to Anne Bradstreet—but his work was not published until the twentieth century. In 1937, while working in the Yale University Library, Thomas H. Johnson discovered Taylor's manuscripts. The works first appeared in print in 1939.

Little is known of Edward Taylor's early life. He was probably born in Coventry, England, in about 1644 and had migrated to New England by 1668, where he stayed briefly as a guest of Increase Mather.

Taylor matriculated at Harvard College and graduated from that institution in 1671 with his roommate and friend Samuel Sewall, the famous judge. While at school, Taylor was made a student butler, usually a position reserved for responsible, older undergraduates. He was also one of four students chosen to speak before the president and fellows during his senior year.

From Harvard, Taylor moved to Westfield, on the frontier near Northampton and not far from Connecticut, in 1671. At the end of the first year of his service as a minister, the town voted to keep him on, although King Philip's War (1675–1676) prevented his ordination until 1679. Taylor served the congregation as both pastor and physician, a dual role that was not uncommon in Puritan Massachusetts, remaining at Westfield for the rest of his life.

Academic and career successes aside, Taylor's personal life seems to have been fraught with tragedy. He and his first wife, Elizabeth Fitch, had seven children between 1675 and 1688. None of these children outlived their father, and Elizabeth herself died in 1689. In 1692, Taylor married the daughter of a Hartford judge, with whom he had six children, all of whom reached adulthood, though only one male descendant carried on the family name. Taylor dealt with his losses in the poem "Upon Wedlock and the Death of Children," lamenting the "branches" taken from his tree.

Taylor served his congregation ably for a long time. Samuel Sewall remarked that he once preached a sermon in Boston worthy of St. Paul's famed Preaching Cross in London. His tombstone in Westfield praises him as an "Aged, Venerable, Learned, & Pious Pastor ... Served God and his Generation Faithfully for Many Years."

An inventory of Taylor's estate taken after his death in 1729 showed him to be in possession of a substantial library. It was not at all uncommon for Puritan pastors to accumulate large libraries, but this library was one of the largest in the area where Taylor preached. His library included many expensive works rare in New England, a collection of seventeenth-century schoolbooks, and books that aided Taylor's practice of medicine. It also contained books by Cotton Mather, Increase Mather, and Samuel Sewall, which indicate that Taylor kept up his reading in current affairs.

As mentioned above, Taylor's considerable skill as a poet did not become known until more than two centuries after his death. Taylor's will specifically instructed that none of his 400 pages of accumulated manuscripts ever be published. In accordance with Taylor's wishes, his grandson Ezra Stiles, president of Yale, deposited the unopened manuscripts in the university library.

The themes of Taylor's poetry are predictable enough for a man raised on seventeenth-century Puritanism: God's power, man's painful march to sainthood, and deep love for Christ. What sets his poems apart from many other works produced in colonial America is his style. He avoids the plain style, favoring rhetorical flourish and high-minded analysis of scripture. Following English models, he also modified love poetry to serve religious ends.

Taylor's central work is a series of loosely connected poems that explains most of the tenets of Puritan faith. Taylor called the work *God's Determinations Touching His Elect: And The Elects' Combat in Their Conversion, And Coming Up To God and Christ: Together With The Comfortable Effects Thereof*. While other Puritan poets, particularly Michael Wigglesworth in his *Day of Doom*, focused on the triumph of the church at the end of the world, Taylor focused on the individual's personal journey to sainthood in a way that could be compared to the works of some of the metaphysical poets then working in England. In addition to the lengthy *God's Determinations*, Taylor wrote a number of shorter *Sacramental Meditations*, which were, in essence, autobiographical treatments addressing Taylor's love for Christ.

Tea

Originally imbibed for its medicinal properties, tea has not only been an important commodity and widely consumed beverage throughout the world but also—of particular relevance to the American colonies—the main ingredient of a domestic ritual in Great Britain. Of the kinds of tea annually exported

from China, black and green are the main types. Separated by quality in an ascending order of fineness, black is divided into bohea, congou, and souchong; while green could be either single or hyson. On occasion, China exported small quantities of pekoe (the finest black) along with twankay and hyson skin (medium-quality greens).

During the seventeenth century, the tea trade was haphazard and fragmented. Tea was procured by sailors and employees of the East India Company (EIC) for private trade to supplement their salaries, having little influence on Chinese production. Traders generally bought small quantities at varying prices wherever they went in Asia, carried it home in ships with other goods, and sold it privately or through auctions. Conversely, the Chinese tea trade was extensive and highly organized, albeit overwhelmingly domestic. Until demand for tea increased in Europe and became linked to elites, few merchants bothered to engage solely in the tea trade. Yet even when the EIC gained a monopoly on British tea importation and started shipping large amounts of tea to England and Europe, it hardly affected the regular direct trade of China.

There were many reasons for the rise of tea consumption after 1680. Tea was more profitable than coffee for existing networks of wholesalers and local retailers selling to households in Britain and the colonies. Since tea was consistently available at an affordable price, families of limited means were accustomed to drinking it rather than coffee. As a result, tea consumption became customary, leading to a vastly expanded domestic market. In Britain, the American colonies, and large parts of Europe, tea consumption became a central part of every meal and a domestic ritual, where tea and sugar were served with certain other foods. Although initiated among the upper classes, the ritual was primarily a cultural phenomenon that eventually transcended class distinction.

Tea consumption came to represent a healthy lifestyle that offered a morally sound alternative to the drinking of alcohol, which had previously been the most common beverage. The theoretical justification for drinking tea (derived from this context of health) emphasized balance and moderation.

Another reason tea consumption was tied to respectability was that its physical equipment (tea services and china) tended toward refinement on a small scale, as opposed to a costly, conspicuous display of wealth. As a result, tea consumption was firmly established in the home and became so embedded in the culture of respectability that it could not become unfashionable. An increase in the number of people who wanted to think themselves respectable meant a demand for the commodities used in this ritual.

The importance of smuggling to the development of the European tea trade cannot be overestimated—not merely for its detraction from legitimate trade and profits but by contributing significant innovations in trade while promoting economic growth. Tea smugglers developed more efficient means of transportation, took advantage of international facilities of capital and credit, and invaded established channels of legal distribution; in short, they expanded markets beyond the norm. Focusing on isolated markets like those on the coast and rural regions, smugglers introduced tea to areas far removed from the influence of the fashionable world. After 1760, tea smuggling was so prevalent that the practice threatened legal trade, alarming the government and legal traders.

In 1767, the British Parliament laid a tax, part of the Townshend Duties, of three pence a pound on all tea imported into the American colonies. Although tea could still be sold more cheaply in the colonies than in England even with the new tax, the Townshend Duties caused problems in the colonies. While the revenue act of 1767 taxed tea, it also placed duties on glass, white lead, painters' colors, and paper. Revenue from the Townshend Duties was to be used for the administration of the duties and the support of civil government within the colonies, while the residue, if any, was to be appropriated by Parliament for the defense of the colonies.

Prior to 1767, the colonial customs service and that in the British Isles were under the direction of a single board in London. The Townshend Acts created a separate board in America under the control of the king. Established in Boston, the American customs commission managed all American port officials, who could search and seize anything, utilizing a new search warrant to be issued by colonial courts.

Previously, imperial taxes in America were collected at local ports, local costs for collection deducted, and the net balance transmitted to London. But now colonial officials had new reason to enforce imperial duties, because they were paid based on the basis of how much revenue was collected. Since the prime minister selected officials to administer the new system, it allowed Lord North and his associates to use the system for political patronage.

Tea Act (1773)

When Parliament approved the Tea Act on May 10, 1773, it triggered a sequence of events that led to a crisis in the British Empire. First Lord of the Treasury Frederick North had urged its passage to save the financially troubled East India Company, England's largest. Yet colonists in America saw it as part of a plan to deprive them of their liberties.

Since its victory over France in the Seven Years' War in 1763, the English government had sought ways to fund the escalating costs of maintaining its expanded empire in North America. In the face of growing resistance to taxation at home, British ministers concluded that they must raise revenue in the colonies. However, most colonists, who believed that only representatives they had elected could impose taxes, viewed parliamentary taxes—as they did the 1765 Stamp Act and the 1767 Townshend Duties—as evidence of a developing plan to take away their rights. Protests and boycotts by colonists led to the repeal of most of those taxes.

The remaining tax was a three-pence-per-pound levy on tea, a commodity widely consumed in North America. Many colonists, however, purchased smuggled tea imported from Dutch sources, a circumstance that contributed heavily to the growing financial crisis facing the East India Company. Dwindling sales in the colonies, which reputedly consumed nearly 5 million pounds of tea annually, and a saturated domestic market left the company with a surplus of nearly 18 million pounds of tea in early 1773. Making matters worse, company ships were bringing an additional 8 million pounds from China. Since tea sales represented about 90 percent of the company's revenue, it was near bankruptcy. When company directors petitioned the government for both a loan and a request for reduced taxes on their tea exports, they found a receptive ear in Lord North.

He developed and pushed through Parliament a plan not only to save the ailing company but also to raise revenue in the colonies and confirm the right of the English government to tax the colonists. He supported the request for a government loan and a reduction in some of the taxes the company had to pay. When some members of the House of Commons also argued for an elimination of the remaining Townshend Duty on tea, North refused. Retaining that duty, he maintained, was an essential part of the government's plan to raise money to pay the salaries of English officials in the colonies. Moreover, he saw the duty as an important symbol of British sovereignty, specifically Parliament's right to tax the colonies.

North emerged victorious and the East India Company received a government loan of 1.4 million pounds and permission to ship their tea directly to the colonies. The company would not only avoid paying the tax normally collected in England but also the requirement that it sell its tea at public auction to merchants who, in turn, would sell it to merchants in the colonies. The company could select its own merchants, or consignees, in the colonies and further reduce the cost of the tea. Although the tea continued to carry the three-pence-per-pound Townshend Duty, the total price to American consumers would drop by nearly 50 percent, making it cheaper than smuggled Dutch tea. In September, the company shipped over 1,200 chests of tea destined for four colonial ports.

Opposition to the Tea Act developed first in Philadelphia and New York, where merchants, who had become dependent upon smuggled tea, faced a significant loss of business. They argued that the legislation creating a monopoly for the East India Company represented a precedent that would destroy all foreign trade. Others worried that the British were engaging in a cynical ploy to deceive the colonists, with cheap tea, into relinquishing their principled opposition to taxation without representation.

Tea consignees in New York City, Philadelphia, and Charles Town, South Carolina resigned in response to threats from mass meetings. The most notable resistance to the act occurred in Boston, where activists tossed the cargo from three tea ships into the harbor on December 16, 1773.

In response, the British government, early the following year, passed a series of measures to punish Boston and the Massachusetts Bay colony. Besides closing the port of Boston, these Coercive Acts limited town meetings, provided for the quartering of British troops in empty public buildings, and gave the Crown the power to select members to the provincial council. Called the Intolerable Acts by colonists, the punitive legislation persuaded twelve colonies to send delegates to a Continental Congress in Philadelphia in 1774, a step that eventually led to the Revolution.

Technology

Colonial American technology blended early modern European technologies with indigenous American and African elements, all adapted to the material conditions of the Americas. Some materials, most notably wood, were abundant in America but scarce in Europe, while labor, abundant in Europe, was scarce in America. Although colonial America was not a particularly dynamic society technologically, it shared in technological changes in the Western world, as well as showing its own local peculiarities.

Multicultural Origins of Colonial Technology

Many aspects of growing New World crops such as corn and tobacco were obviously dependent on Native American knowledge, although the scale at which the colonists operated was often far vaster than that of the indigenous inhabitants. Native Americans also pioneered the tapping of maple trees and the production of maple sugar. Another area where colonists borrowed Native American techniques was tree felling. Rather than chopping down trees, many of the colonists used a common Native American procedure called "girdling," which involves cutting or burning a circle through the bark around the tree and then leaving it to die and eventually fall.

Enslaved African Americans also brought technical skills with them. The early cultivation of rice in South Carolina relied on the knowledge and skills enslaved West Africans brought about growing, processing, and irrigating the crop. The English colonists also learned from previous European colonizers. For example, some of the techniques for growing and preparing tobacco were learned from the Spanish, the first colonizers to grow this plant.

Immigrants and migrant workers from other parts of Europe enriched the technology of the English colonies. The importance of Continental workers for industrial technology can be seen as far back as the first ventures of the Virginia Company, the most technologically minded of the early colonization companies, when the first Polish and Dutch and then Italian glassmakers were brought in to get the glassworks up and running. The first sawmill in Massachusetts Bay was built by Danish immigrants. The early eighteenth-century iron industry in Virginia involved the immigration of German and Swiss miners and ironworkers.

The technology of Continental immigrants changed domestic life, as well as American industry. Log cabins were introduced by Swedish settlers, who came to the Delaware Valley in 1638. German immigrants introduced several technical innovations of general use, such as the deep or "Conestoga" wagon, with a far greater carrying capacity than the English cart, and the long rifle.

British settlers favored inefficient open hearths for both cooking and heating, using wood lavishly, while Germans introduced the far more energy- and fuel-efficient technology of the stove. This innovation only slowly diffused to the Anglo-American population, and early stove designs were open to improvement. Both of the two great physicists produced by colonial America, Benjamin Franklin and Benjamin Thompson (best known by his later title of Count Rumford), were fascinated with the problem of efficiency in fireplaces and stoves, and they originated stove designs.

Technology and the American Environment

For power technology, the colonists used (besides direct animal and human muscle power) a technology widely used in Europe since ancient times: the mill. Mills were particularly suited for America due to the shortage of labor and the presence of easily exploited quick-running streams. Although windmills were used from an early period, the most common form of mill was the water mill. All three forms of water mill—the horizontal mill with the wheel on its side; the undershot mill with the water running along the bottom to turn the mill; and the most efficient, the overshot mill, with the water running along the top of the mill—appeared in colonial America.

The first printing press in British North America dates to 1638 and the arrival of Stephen Daye in Massachusetts. Daye set up the colonies' first printing plant, the Cambridge Press, and began publishing a broadside called The Freeman's Oath. (© North Wind Picture Archives)

Mills had many uses. Two of the most important were grinding grain (gristmills) and cutting lumber into boards (sawmills). Sawmills, which used straight

saws rather than the later circular saw, wasted considerably more wood than did sawyers cutting lumber by hand (sawdust also polluted mill streams when not properly disposed of), but they were much faster. The abundance of wood in early America and the demand for boards meant that speed was more important than efficiency.

Another use of mill power was fulling woolen cloth, that is, pressing cloth to increase its weight and bulk. Fulling mills, mostly animal-powered, were found in New England from the 1640s, spreading to the mid-Atlantic and Southern states after 1700. Animal-powered mills also crushed bark for tannin, and, by the mid-eighteenth century, mills were grinding tobacco into snuff. Thousands of mills dotted the colonial landscape, to the point that a shortage of millwrights became a problem.

Although many aspects of European technology could be transplanted to the Americas with little change, the differing American environment prompted modifications and innovations. A good example of how the material conditions of colonial life and the colonial economy shaped technology is the invention and spread of the zigzag fence.

Fencing land was important both for practical reasons of protecting crops from animals and for ideological reasons—"enclosing" agricultural land was essential to claiming it as property. Early settlers built the kinds of fences they had known in Europe—vertical wooden posts set into the ground, with crossbeams nailed to them. (They made little use of hedges or stone fences at first.) The problem with these fences was that they required a good deal of labor to build, as well as plenty of nails, which were scarce.

The zigzag, worm, or snake fence, pioneered on the Chesapeake, took advantage of two things America had in abundance: land and wood. Zigzag fences piled rails on top of each other in a zigzag formation. They were held together by slanted stakes at the corners. The fences took up a lot of space and required a lot of wood, but they did not require nails and could be built quickly, since no postholes were needed. They could also be taken down quickly and moved if the need arose. Zigzag fences eventually became the most common type of wooden fence outside of New England, which stubbornly stuck to post fences in an area where land was scarcer. (The New England stone fence emerged late in the colonial period, partly as a response to deforestation.) The bountiful supply of wood also led early settlers to use wooden pegs in construction rather than expensive hand-wrought metal nails.

The inventor of the zigzag fence is not recorded, and many of the improvements and adaptation of European technology to American conditions were originated by persons now unknown; however, there are some known innovators in the seventeenth century. The first American mechanical patent was issued by the Massachusetts Bay Colony to Joseph Jenks in 1646, giving him exclusive rights to his innovations in sawmills and a mill for making scythes for fourteen years. Despite this early example, patents never became a standard way of rewarding technological innovation in colonial America. Most inventors sought to sell their products directly or to be awarded a cash prize by a colonial legislature or, later, a scientific society.

Industries

The most important communications technology of the early modern period was the printing press. The first printing establishment in British North America was founded in Cambridge, Massachusetts, in 1638. (The British colonies were actually latecomers to printing, as the earliest surviving Spanish American printed text, from Mexico City, dates from nearly a century earlier.) The first printing press in Pennsylvania was established in 1685, and the Philadelphia printing industry dominated eighteenth-century American publishing.

The limitations of the American market meant that colonial American printing was not technically advanced by European standards. Americans seeking the services of fine printers and bookmakers—cartographers looking for printers for their maps, for example—continued to turn to London printers. By contrast, cheap publications with a ready local market, such as almanacs and newspapers, poured in torrents from American presses.

Printers also branched out into other technological activities, such as papermaking, but the presses themselves still usually had to be imported. Type fonts also had to be imported from England. The Connecticut silversmith and counterfeiter Abel Buell presented a prototype font to the American Philosophical Society in 1769, but the first successful American commercial type foundry did not appear until after the Revolution.

Probably the most complex technological objects in the preindustrial world were ships. From modest beginnings, shipbuilding became a major industry in the eighteenth-century British colonies, with major centers of production in Boston and Philadelphia joined by Virginia after about 1740 and Charles Town after about 1760.

Access to wood made America a natural for shipbuilding (and for supplying material to ships built elsewhere, such as the tall pine trees that made masts for the ships of the Royal Navy), but it took some time to learn how to use unfamiliar woods. For example, some early American ships were built with red oak, which does not resist water damage as effectively as white oak. American ships also were built with connecting dowels, or "treenails," made of another American wood, locust, rather than oak.

Eighteenth-Century Improvements

By the early eighteenth century, the growing wealth, population, and sophistication of the colonies meant that technology had become more ambitious and complex. A growing class of technological specialists included surveyors, navigators, clockmakers, almanac writers, and the builders of scientific instruments. Private schools and teachers catered to men desiring some familiarity with technical mathematics, and the subject even began to creep into the university curriculum.

The colonies were now able to plan and carry out large engineering projects, such as the 1,600-foot-long wharf built at Boston from 1710 to 1713 and the later Newport wharf, which was over 2,000 feet long. Merchant interests pressed for further infrastructure improvements, including the improvement of harbors, dredging of channels, and building of roads.

The founding in 1754 of the Royal Society of Arts, a London group devoted to improving technology and agriculture by offering prizes for innovations, gave American technology a boost similar to that given American science by the founding of the Royal Society in the seventeenth century. American members of the Society of Arts included leading scientists like Franklin and the Charles Town natural historian Dr. Alexander Garden. Franklin and other

colonial American scientists shared with the Society of Arts a belief in the fundamentally utilitarian orientation of science.

America's first successful scientific society, the Philadelphia-based American Philosophical Society, over which Franklin presided, emphasized science's technological applications. Of the six original standing committees, two were devoted to technological improvement: the committee on mechanics and architecture and the committee on husbandry and American improvements. The society also advised on technical problems, such as the ambitious project to construct a canal between the Chesapeake and the Delaware River. The canal was not built until several decades later, and, at the time, Franklin, among others, urged the promoters to get expert engineers from Europe.

The Virginia Society for the Promotion of Usefull Knowledge, founded in 1773, took an even more explicitly utilitarian stance than the American Philosophical Society. John Hobday, the inventor of a threshing machine, was awarded a gold medal shortly after the society's foundation. The Virginia Society, however, was swept away in the turmoil of the Revolution.

The Reverend Jared Eliot, a Connecticut clergyman, sought to introduce some of the improvements in agricultural technology associated with the English writer Jethro Tull to America. Eliot's series of six essays, *Essays on Field-Husbandry in New England* (1748–1759), advocated the use of a drill-plough, a machine for planting seeds evenly along rows rather than scattering them by hand. Eliot's son-in-law Benjamin Gale, a member of the Society of Arts and the American Philosophical Society, won a medal from the Society of Arts for an improved drill-plough in 1770; however, use of the drill-plough did not catch on until the early nineteenth century. Eliot also published a book on extracting iron from black sand, for which he won a medal from the Society of Arts at a time when Britain wanted to increase colonial iron production.

Development of American technology acquired a political edge in the period following the end of the French and Indian War (known as the Seven Years' War in Europe), as Americans believed that domestic manufactures would lessen the colonies' economic subjugation to Great Britain. The New York Society of Arts, founded in 1763 by businessmen from the city's "patriot" faction, was less concerned with technological innovation in general than with the specific goal of fostering an independent linen industry in the city.

British concern with American technological development varied in different economic sectors. The general pattern was for the British to encourage the manufacture of materials that could then be finished in Britain. Thus, pig and bar iron were encouraged, but not steel.

The production of potash (potassium carbonate), a chemical made from wood ash with a variety of commercial uses, was also encouraged by the British in the late colonial period. American settlers had been making potash for their own use since the earliest settlements—it was used in soap making, glass making, and the preparation of saltpeter from gunpowder. The British Parliament, facing a shortage, lifted the tariff against colonial potash in 1751. This brought about a boom in the first American chemical industry. By 1770, the colonies were exporting 2,000 tons of potash to Britain annually, about two-thirds of Britain's consumption.

In the years immediately preceding the Revolution, Americans took little notice of the technological advances made in Britain, which was then in the early stages of the industrial revolution. (Nor did the British encourage colonial industrialization.) There were only three steam engines in the colonies, and these were of the older and less efficient Newcomen type. Christopher Colles, an Irish immigrant who operated in Philadelphia and New York, tried to promote steam engines and gave lecture courses at the American Philosophical Society on hydraulics and pneumatics in 1772, but he had little success. In 1774, Colles went to New York City, where he promoted a plan to pipe water into the city through hollow logs. The plan garnered some support but was cut short by the American Revolution.

Americans were interested in emulating the canal-building movement transforming the internal communications of Great Britain. In addition to the Chesapeake-Delaware Canal, there were plans to build a canal connecting Beaufort and the Neuse Rivers in North Carolina and one connecting the James and York Rivers in Virginia. Despite these and several other canal plans, no substantial transport canals were built before the American Revolution.

War has always been a spur to technological innovation, and the American War for Independence was no exception. David Bushnell, a young Yale student, invented and built a one-man submarine for use against the British. It was an effective submarine but an ineffective weapon. Less dramatic but more influential was the Rhode Island metalworker Jeremiah Wilkinson's development of a process for making nails out of cold iron rather than forging them.

One technological problem that was never completely solved during the war was that of gunpowder. Despite the efforts of some of America's sharpest minds, including Benjamin Rush, the Continental army remained dependent on imported gunpowder.

Tenant Farming

Although it may seem surprising, due to the abundance of land in North America, tenancy was found everywhere in the colonies. Since many coastal regions were occupied, sons of poor men were unable to acquire land and form households where they were born unless they leased the land. In frontier areas, wealthy individuals who had money and political power procured millions of acres of undeveloped land through speculation, grants from provincial governments, or inheritance. Speculators leased excess land to tenants rather than sell it as small parcels for profit.

During the early years of settlement, for example, Dutch landlords in New Amsterdam enticed some families by offering low rents for long terms—generally for several generations. In 1705, one-third of the householders in Virginia's Prince George county were tenants, but, as nearby frontiers had come under cultivation by the 1770s, the proportion increased to more than half. Most families in southern Maryland and Virginia's Northern Neck rented land in the 1780s.

Increased population density changed the character of tenancy. With most land developed by the 1750s, landlords usually rented land for short periods and charged substantial rents, amounting to a third or even half of a single worker's crop. Tenants in these areas could barely afford the high rents, as they rarely accumulated much savings. Short-term tenancy grew in regions like the Hudson River Valley, where tenancy was already common, and in places tied to growing for urban markets such as southeastern Pennsylvania. Frontier landlords commonly granted leases at nominal rents for several generations. In return, tenants were required to improve the land by building structures and planting orchards.

Although tenants lived autonomously, they depended on landlords for land, building materials, tools, and often for marketing their crops. Most tenants paid a portion of their crop as rent, since they owned little other property. The richest tenant might own a horse, a little livestock, and live in a small house, but few had outbuildings like kitchens to improve their standard of living. Most tenant farmers did not stay in the same neighborhood for more than a few years, usually they moved away in search of land or other opportunities.

Markets complicated the dependence of tenants upon landlords. Each party tried to gain wealth from the land, but landlords could raise rents at will and dispose of the land whenever they wanted. Since tenants were dependent on landlords, good weather, and markets, many received charity from local officials. Common types of relief, often provided by or at the direction of county court justices, were exemptions from taxation, cash payments, and donations of food or manufactured goods. Church vestries also provided indigent childcare and paid medical expenses for poor.

The children of tenants received little help from their poor parents, whether the parents were alive or dead. Middle-aged tenants usually had estates valued at less than 45 pounds, leaving their beneficiaries with only a small sum after debts were paid. Even when tenants could add an inheritance to accumulated property, they rarely had enough money or collateral to buy a slave or a tract of land.

The most frugal tenant could only amass the money necessary to buy a 50-acre plot after benefiting from five years of good crops, high market prices, and saving more than half of each year's profits. This was a very difficult task, however, since tenants paid taxes and needed to purchase manufactured goods and subsistence items with their profits. Some former tenants escaped their hardship by moving to either a raw frontier or a rapidly developing area.

Most farmers tried to avoid tenancy, seeking instead economic independence. Whenever rich men threatened to secure land tenure, farmers and their sons resisted dependency, sometimes violently. Tenancy-related revolts occurred in the Hudson River Valley, New Jersey, Virginia, Maryland, and Pennsylvania. From revolts, wealthy landowners learned that secure land tenure for farmers ensured the social peace they desired, while attempting to collect rents yielded only small amounts of money or caused rebellion. Since land was abundant, most landowners sold off undeveloped land, deciding instead to retain their economic power by granting credit.

Tennessee

Tennessee, which was for most of the colonial period an over-mountain extension of North Carolina, became the sixteenth state of the Union in 1796. Roughly rectangular in shape, Tennessee is geographically divided into three sections—east, middle, and west—by the Cumberland Plateau and the northwesterly-flowing portion of the Tennessee River. Colonial Tennessee was a land of overlapping frontiers: Multiple Native American groups claimed all or some of the territory for hunting or dwelling, while English, French, and Spanish explorers and traders competed for access to and control of native trade and lands.

In the winter of 1779–1780, settlers James Robertson and John Donelson led a party of 300 settlers into middle Tennessee and built a fort on the Cumberland River. Fort Nashborough, as it was called, later became the settlement of Nashville, chartered as a city in 1806. (Courtesy of the Tennessee State Library and Archives)

The first Tennesseans arrived more than 12,000 years ago, and, by the time of European contact in the sixteenth century, Tennessee was home to several distinct groups of Mississippian Indians or frequently visited by them. The state's name likely derives from Tanasi (also spelled Tanasee), a Cherokee town.

The advent of Europeans and their diseases wreaked havoc on Native American populations. By the early eighteenth century, disease and warfare had taken their toll. The Cherokee would be the only natives with permanent settlements in the Tennessee territory, although the Chickasaw still claimed hunting grounds in middle and west Tennessee.

Spanish explorer Hernando de Soto's visit in the spring of 1540 marked the first European presence in the state (including the first black visitors—both free and enslaved Africans). The Spanish would have little other direct contact in the state, though their presence in Florida, as well as their later control of the Mississippi River port of New Orleans, guaranteed they would remain important to early Tennessee settlers. In 1673, English trader-explorers James Needham and Gabriel Arthur from the Virginia colony entered east Tennessee, while French explorers Jacques Marquette and Louis Jolliet stopped along the Mississippi River at the Chickasaw Bluffs.

As the French and English competed for Native American alliances and control of Tennessee, trade was the weapon of choice, though violence was ever-present. The French established trading networks mostly in the west but also into the Cumberland Basin at French Lick (near present-day Nashville). English traders entered Tennessee from the southeast. The native peoples sold not just animal pelts but also other natives as slaves into the coastal settlements or the West Indies.

English advantages in the supply of trade goods successfully bound the Cherokee to them during most of the Anglo-French contests for North America. English victory in the Cherokee War of 1760 began a treaty-war-treaty cycle that continued into the nineteenth century, eventually ending with the

Cherokees' forced removal to the west of the Mississippi River under President Andrew Jackson of Tennessee.

The desire for land—whether for hunting, farming, or selling for profit—is the constant theme in Tennessee's early history. The Proclamation of 1763, declaring Tennessee officially off limits to British-American colonists, did little to stop the flow of British settlers over the mountains for hunting or settlement. “Long hunters” like Daniel Boone—so called because of the lengthy hunting trips over the mountains into the Tennessee and Kentucky territories—came back armed with more than just animal pelts. They also returned with tales of bountiful lands to encourage settlement and with information for their land-speculating partners, who planned to profit from such expansion.

The first permanent Anglo settlers arrived in the late 1760s. One of the biggest speculators, Richard Henderson of North Carolina, formed the Transylvania Company, and, in the 1775 Treaty of Sycamore Shoals, purchased 20 million acres of present-day Tennessee and Kentucky from Cherokee factions aligned with Attakullakulla (“the Little Carpenter”). Eager to exploit his new purchases, Henderson financed the land and river voyages of James Robertson and John Donelson's group of 300 settlers into middle Tennessee, where they founded Nashborough (later Nashville) in 1779–1780. Speculators, surveyors, and lawyers would become prominent political and social leaders in early Tennessee.

In violation of both the British Proclamation and existing treaties between colonial governments and the Cherokee, settlers in northeastern Tennessee bound themselves together into the extralegal Watauga Association (1772–1778) and crafted their own land agreements with factions of Cherokee leaders. During the American Revolution, when Tennessee settlers felt exposed to the British and their Cherokee allies, Watauga settlers sought annexation from either North Carolina or Virginia, and, in 1777, became Washington County, North Carolina.

The move for local self-governance remained dormant for only a short time. When North Carolina was slow to cede its western lands to the newly formed United States, local settlers designated themselves the State of Franklin in 1784 and petitioned for admission as the fourteenth state in the Union. Rebuffed, they disbanded and returned to North Carolina, becoming the federal “Territory Southwest of the River Ohio” in 1790 and achieving statehood as Tennessee in 1796.

Texas

Spain founded and settled Texas as a buffer against French encroachment in Louisiana. Throughout the Spanish and Mexican periods, the settler population remained small, as the indigenous peoples controlled most of Texas.

In 1519, Alonso Alvarez de Pineda led an expedition to explore the lands along the Gulf of Mexico coast from Florida to Texas. In the next decade, Álvaro Núñez Cabeza de Vaca accompanied the Pánfilo de Narváez expedition to Florida and then sailed along the shores of the Gulf Coast. Many in the expedition died before the survivors of the expedition landed ashore on Galveston Island off the Texas coast in 1528.

Cabeza de Vaca and Esteban, a black slave, wandered around Texas for years, sometimes being held captive by the native peoples. In 1536, the two men found some Spaniards, who took them to Mexico. Cabeza de Vaca's stories about his journeys increased Spanish interest in the lands north of New Spain. Francisco Vázquez de Coronado's expedition passed through Texas in 1540–1541.

The next major expeditions into Texas did not occur until after 1685, when René Robert Cavalier, Sieur de La Salle, trying to initiate a French colony at the mouth of the Mississippi River, landed at Matagorda Bay and built Fort St. Louis on Garcitas Creek. After several attempts, a Spanish expedition led by Alonso de León discovered the ruins of the fort, which had been attacked by Karankawa Indians. The French attempt to settle Louisiana prompted

Spanish officials to occupy Texas.

The Nuestra Señora de Loreto presidio and Espiritu Santo de Zuñiga mission, know as La Bahía, was an important Spanish settlement in Goliad, southern Texas. The area was a main passage from Mexico to other Texas missions and settlements. (Library of Congress, HABS, TEX, 88-GOLI,4)

Missionaries first settled East Texas to work with the Caddo Indians. In 1690, Franciscan missionaries founded missions San Francisco de los Tejas and Santísimo Nombre de María. The missions failed by 1693, as the native peoples, ravaged by smallpox, no longer supported the missionaries. Also, the isolated missions had difficulty obtaining supplies. Missionaries wanted to reoccupy the area, and the French neighbors in Louisiana supported the Spanish venture for trade reasons. In 1716, Captain Domingo Ramón led the expedition that founded four missions and the presidio (fort) San Francisco de los Dolores. The East Texas settlements grew slowly, and the settlers carried on illegal trade with nearby French colonists.

In 1718, Governor Martín de Alarcón founded presidio San Antonio de Béxar and Mission San Antonio de Valero, later called the Alamo. From 1720 to 1731, four missions opened in the San Antonio area, including San José y San Miguel de Aguayo, San Francisco de la Espada, Nuestra Señora de la Purísima Concepción, and San Juan Capistrano. All of these missions except for San José were transferred from the East Texas mission field. The civil settlement grew in 1731, when fifty-five Canary Islanders moved to San Antonio.

San Antonio remained a small, marginal settlement that subsisted on agriculture, ranching, and trade with the native peoples and merchants from other parts of New Spain. Apache and Comanche raids hurt the settlement for years and prevented expansion. Native hostilities continued until the Comanche peace of 1786 brought relative peace to the area and allowed for some expansion. The missions began secularization in the late eighteenth century, and most became parish churches.

Another important mission field, presidio, and settlement in present-day Texas was at Goliad. In 1722, the Spanish founded the presidio Nuestra Señora de Loreto and mission Espiritu Santo de Zuñiga, known as La Bahía. The Spanish did not consider this area part of Texas, but it was the main entryway from Mexico to the Texas settlements.

The Spanish also tried but failed to establish missions and forts among Tonkawas in the 1740s and among the Lipán Apaches at the San Sabá River in the 1750s. The Apaches would not stay at Mission Santa Cruz de San Sabá, and within a year, in 1758, Comanches and other Apache enemies destroyed the mission.

Meanwhile, the East Texas settlements were barely surviving. In 1773, the Crown ordered East Texas settlers to move to San Antonio. The settlers petitioned to move back to East Texas, and under Antonio Gil Ybarbo, they eventually settled Nacogdoches. The East Texas settlements continued to have close ties to Louisiana.

The independence wars that began in the 1810s with Father Miguel Hidalgo's revolt hit Texas hard. In the 1812 invasion of Texas, Bernardo Gutiérrez de Lara and American participants took San Antonio and killed Governor Manuel Salcedo. In 1813, the Spanish army reclaimed San Antonio and executed those suspected of siding with the rebels. The region was devastated by the decade of fighting when Mexican independence was finally achieved in 1821.

During the Mexican period, large numbers of Anglo-American settlers moved into Texas, changing the makeup of the colony. Texas became independent of Mexico in 1836.

Theater

While some plays were written and produced in North America during the colonial period, most were imported directly from England, scripts and actors alike. Initially, the rigors of early settlement did not encourage playwriting or acting. Later on, acting was too precarious a profession to risk unknown plays or actors.

In the English-speaking colonies, Shakespeare was the most popular playwright, more so than in England at the time. The first known Shakespeare production in North America was *Romeo and Juliet*, performed in New York by an amateur group in 1730. By the outbreak of the Revolution, nearly 500 performances of Shakespeare's plays had been staged in the colonies. Other popular plays were George Lillo's *George Barnwell*, George Farquhar's *The Recruiting Officer* and *The Beaux' Stratagem*, and John Gay's *The Beggar's Opera*. Despite the long Atlantic passage, a new play opening in London usually reached the colonies within three to seven months.

Most of these plays were followed by an "afterpiece," usually a lighthearted farce or a musical performance. Although Virginia and Maryland were the most accepting of the theater, plays were performed in nearly all of the colonies. Local amateur productions were also more apt to receive acceptance than touring professional ones.

Mercy Otis Warren was a prolific playwright, poet, and historian of the revolutionary period. Her work—including the dramatic satires The Adulateur (1773), The Defeat (1773), and The Group (1775)—commented on current events and supported the patriot cause. (Museum of Fine Arts, Boston/Bridgeman Art Library)

The French and Spanish also brought their own theatrical additions to North America during the colonial period. Passion plays, dramatic representations of

the life and death of Jesus Christ, had long been a part of Catholic Europe. By 1526, the Spanish were using such plays to convert Native Americans to Christianity. Likewise, Jesuit priests in Canada had started to employ similar methods by 1606. Once these French communities were permanently established, they also began importing plays and actors from France, just as the English were doing to the south.

Among the other European immigrants, the Dutch and German colonists generally regarded plays with tolerance, if with the opinion that money could be better spent elsewhere. After the British acquisition of New York, plays became more common in that colony.

Early Plays, Venues, and Companies

The first known play to be performed in an English colony was *The Bare and the Cubb* on August 27, 1665, in a tavern on the eastern shore of Virginia. Although the play was deemed a success, one member of the community, Edward Martin, complained of heresy. The three actors in the play, Cornelius Watkinson, Philip Howard, and William Darby (also author of the play), were summoned to the county court. There, the magistrates requested that the defendants perform the play and found them "not guilty of fault." Martin was then requested to pay the court costs. It is not known if there were any repeat performances.

Other early plays include a production of Benjamin Coleman's *Gustavus Vasa* in Cambridge, Massachusetts, in 1690 and the *Pastoral Colloquy* in Williamsburg, Virginia, in 1702. The first play to be printed in the colonies was Robert Hunter's *Androboros, a Bl[i]ogographical Farce in Three Acts* in 1714. It was written as a satire of the Anglican Church and was probably never performed.

In 1716, William Levingston began raising funds to build the first organized playhouse in Williamsburg. The first play to be performed there was part of a public entertainment in honor of the birthday of King George I. In time, Levingston's fortunes were reversed and his theater fell into disrepair.

Most professional actors in the seventeenth and eighteenth centuries were members of traveling companies. The first attempts to organize such a company in the colonies began in Philadelphia under the management of Walter Murray and Thomas Kean. The only play known to have been performed by them in Philadelphia was the political drama *Cato*. After mixed reviews, the company moved to New York, where they opened with a performance of *Richard III*. Eventually, they relocated to Williamsburg, where the company finally folded in 1752.

Shortly afterward, the first fully professional company sailed from London to Williamsburg, calling itself the London Company of Comedians. Run by Lewis and Sarah Hallam, the company included the Hallams' three children and ten other English actors. Although they were refused a license to perform, the Hallams decided to stay in Williamsburg and become permanent members of the community. Eventually granted a license, they began acting, promising only the most moral plays. In time, they traveled among Virginia, Pennsylvania, New York, and South Carolina.

After Lewis Hallam died in 1755, the company was taken over by David Douglass. The troupe gradually gained acceptance throughout the colonies, in part because it changed its name in 1763 to the American Company of Comedians. It also was the first professional group to perform a play written by an American, Thomas Godfrey, Jr.'s *The Prince of Parthia*. After waiting out the American Revolution in Jamaica, the American Company returned to the United States and continued touring throughout the 1790s.

Overcoming Opposition

During the colonial period, opposition to the theater was widespread, especially in the Northern colonies. Massachusetts, New York, Pennsylvania, New Hampshire, and Rhode Island all passed numerous laws against acting. Initially, these rules reflected the sensibilities of the Puritans and Quakers, who hoped to rebuild England in the colonies without England's faults. They regarded the theater as immoral, leading to vices such as idleness, prostitution, and gambling.

As the theater became more respectable, later rulings in the Northern colonies reflected different concerns. Many colonists were suspicious of English acting companies, seeing them as little more than propaganda for the English throne. Likewise, lawmakers did not want money going to English enterprises that were not part of their community. They also did not want the poorer members of their communities spending money on unnecessary items, such as play tickets. Most Northern colonies were centered around cities and towns, making plays more accessible to all members of society. In contrast, Southern colonies had relatively few cities and many outlying plantations and farms, isolating the rural poor and slaves from potential temptation.

These prohibitions culminated in an act passed on October 20, 1774, by the Continental Congress encouraging frugality and economy in the face of impending war. As part of this rule, professional theater was officially banned for the duration of the war. The only plays to be put on by a professional company during the Revolution were in Maryland, the one state that voted against the ruling.

Despite this ruling, amateur acting and playwriting thrived during the Revolution on both sides, loyalist and patriot. Most productions were political, consisting of satire, propaganda, or both. Among the patriots, one of the most prolific writers was the historian and poet Mercy Otis Warren. Examples of her work include *The Adulateur*, *The Defeat*, and *The Group*. All of her plays commented directly on recent events and took place in Boston, sometimes thinly disguised as the mythical country Upper Servia. Passages from her plays were also published in such patriotic publications as *The Massachusetts Spy*.

Plays produced on the opposite side were usually done by British soldiers. Bored with long occupation of American cities, they used plays as a means of demonstrating their cause, as well as for providing entertainment. General John Burgoyne, leader of the troops occupying Boston in 1775–1776, wrote and produced a farce titled *The Blockade of Boston* in 1775. Remembering the 1774 ruling, Burgoyne frequently sent handbills announcing his productions to George Washington, John Hancock, and other members of the Continental Congress as a way of goading them.

Following the British soldiers' withdrawal in 1776, an anonymous parody titled *The Blockheads; or the Affrighted Officers* circulated in Boston. Plays were also written by loyalists as a way of demonstrating their political support for the British cause; such works included Jonathan Sewall's *A Cure for the Spleen* in 1775. Attempting to bridge the gap between patriots and loyalists was the work of Robert Munford. His 1775 *The Patriots* urged for pacifism and reason rather than the blind patriotism demonstrated by those on both sides of the conflict.

While the plays written during the Revolution are more recognizable as political propaganda than as drama, they represent the first true body of such work created in America. Following the war, acting companies again returned to the familiar imports from England, their incomes still too precarious to chance any unknowns. Playwriting independent of English influence did not become part of theater in the United States until the 1850s.

Tidewater

The term "Tidewater" usually refers to the areas of Virginia between the fall line and the Atlantic coast. Technically, the Tidewater region ends where the inland waterways cease to be tidal. The area includes Chesapeake Bay and environs and extends about 100 miles from the coast. Four major rivers feed the bay: the James, Rappahannock, York, and Potomac. The Tidewater in the seventeenth century was the site of some of the most important events in American colonial history; in the eighteenth century, the planters living in the Tidewater adopted a Revolutionary stance that set them on a collision course with Great Britain.

In the closing decades of the sixteenth and the beginning of the seventeenth century, Powhatan built up, through strong-arm diplomacy and outright conquest, a paramount chiefdom that covered most of eastern Virginia. Autonomous Algonquin villages, which were settled communities based on corn agriculture, would offer tribute to Powhatan in exchange for protection against outside attacks and also to prevent Powhatan from turning on them. The birth of the English colony of Jamestown in his world gave Powhatan little cause for concern, and he adopted John Smith into the Tidewater through a complicated series of rituals, culminating in the famous rescue of Smith by Pocahontas, Powhatan's daughter.

As pathetic as the settlement at Jamestown was, it supplanted Powhatan as the main power broker in the Tidewater within a couple of decades. Early attempts to turn a profit from surface mining and trade failed, but tobacco agriculture did not. Eventually, tobacco turned into the Tidewater's staple crop, with small farms and larger plantations spreading out beyond Chesapeake Bay.

Tobacco cultivation was hard on land and labor. The indentured servants who initially worked in the fields gave way to African slaves as the seventeenth century progressed. A Dutch ship brought the first Africans to Virginia, and while their legal status may have been slightly murky, the legal status of Africans in late-seventeenth- and eighteenth-century Virginia was crystal clear. They and their children were permanent chattel, or movable property. A rigid, caste-like system grew to maturity in the Tidewater's tobacco-producing areas.

At the pinnacle of this Tidewater plantation society were the great planters. In addition to dominating the region economically and culturally, they controlled Tidewater politics tightly. Their fathers and grandfathers had worked the land in the Tidewater and struggled to survive in a harsh and alien environment, but by the eighteenth century many of the leading planter families, such as the Byrds and Carters, had begun to establish themselves as a new American aristocracy, one whose powers in Virginia surpassed those possessed by the English aristocracy across the Atlantic. This class of men shared one defining characteristic: they were first and foremost tobacco planters, and this label carried a fair amount of cultural baggage in eighteenth-century Virginia.

Crop masters, as the very best referred to themselves, presented themselves as perfectly independent, skilled agriculturalists who took great pride in their ability to produce quality tobacco. They claimed to know precisely when to plant, sucker, cut, and cure tobacco plants. Their tobacco plantations—requiring large investments in capital, land, and slaves, as well as their extravagant lifestyles, amounting to a blatant attempt to copy the English aristocracy—ran much of the Tidewater into massive debt.

Not surprisingly, the great planters of the Tidewater were susceptible to political philosophies that were fairly radical in England. The ideas have a variety of names—country thought, opposition philosophy, and republicanism to name a few—but they all shared a deep-rooted belief in personal autonomy, civic virtue, and the corrupting influence of political power.

When the tobacco market slowed in the 1760s and early 1770s, the great Tidewater planters saw their personal autonomy, their virtue, and, to some extent, their masculinity eroding, and they took extraordinary steps to stop it. The Tidewater provided some of the most able defenders of American liberty,

both in terms of philosophy, in the person of Thomas Jefferson, and military guidance in the person of George Washington.

After the American War for Independence, the Tidewater continued to be important, as the newly created United States struggled to put together a government and a national identity.

Tobacco

Tobacco, used extensively for curing and in religious and sociopolitical rituals by native peoples across the Americas, was introduced to Europeans in 1492—though they got its name wrong. As tobacco burned its way into our modern history, spreading rapidly across Europe, Asia, and Africa, doctors extolled its virtues as a medicinal panacea, while popes denounced it as the “devil weed” and world leaders encouraged its spread in order to tax it and add to their treasuries. Tobacco use rose, spiraling upward like the evocative smoke of the burning herb, then began plummeting to smoldering ashes as, in the last half of the twentieth century, its use was irrevocably linked to cancer.

Discovery and Cultivation by Native Americans

The tobacco plant and its derivative products were called *cohiba* or *cohoba* by the Taino, the natives of the Greater Antilles who introduced it to Christopher Columbus and his crews. Spain's Royal Historian Gonzalo Fernández de Oviedo y Valdés wrote in the 1530s that it was the hollow inhaler tubes used by the Taino that were called *tabaco*, the name other Spaniards mistakenly understood to be the herb itself.

Tobacco was growing wild in South America by 6000 b.c.e., and the plant belongs to the Solanaceae family (nightshade), specifically to the genus *Nicotiana*, which contains more than 100 species. By the time Christ was born in the Near East, tobacco had spread across most of the Americas, where native peoples chewed its leaves, drank it as a tea, rubbed it onto their bodies, or inhaled it in all manner of medicinal preparations and curing rituals. Above all, however, Native Americans cherished tobacco as a sacred intoxicant that eased communication not only among men but also between this world and the world of the spirits.

By the time Europeans arrived in the Americas, native peoples as far north as today's Montreal were growing vast quantities of tobacco, “on which they set great value,” wrote Jacques Cartier. Columbus and Cartier, among others, recorded that Amerindians used tobacco in many religious ceremonies, took tobacco with them whenever they traveled (it was as important as food), gave tobacco as prestige gifts, and shared tobacco as a key part of many of their social rituals—for example, some North American Indians smoked a *calumet* (peace pipe) before negotiations.

Tobacco's value among Amerindian peoples can also be seen by the way the herb entered their creation myths. Among the Taino, for example, a gob of spittle laden with tobacco juice grew on the back of Demivan Caracaracol, causing so much pain that his brothers broke the hump open with an axe, releasing a female turtle. (Turtles are a common Amerindian symbol for fertility and the creation of the world.) The Hurons also connect tobacco to females and fertility (although it appears that only the men used it), saying that once, long ago, the land was barren until the Great Spirit sent forth a female savior, who created potatoes wherever she touched her right hand, corn with her left, and tobacco where she sat to rest.

The Cuban scholar Fernando Ortiz, in his magnum study *Cuban Counterpoint: Tobacco and Sugar*, hypothesizes that the smoking of tobacco was a later development among the Amerindians than chewing it or inhaling its powder. Keeping the fire away from the smoker's mouth requires more advanced technology than a hollow reed. Mayans may have been the first to develop the cigar, for the earliest archaeological record we have of smoking is a Mayan vessel from 600–1000 c.e. that was discovered in Uazactun, Guatemala. It depicts a roll of tobacco leaves tied with string—and the word the Mayans used for smoking was *sik'ar*.

First Europeans to Use Tobacco

The first European to smoke a cigar was Rodrigo de Jérez, who was sent by Columbus, along with Luis de Torres, on November 2, 1492, to explore inland Cuba. It is said that Jérez enjoyed smoking so much that he took some cigars home with him to Spain. The smoke coming from his mouth and nostrils made him appear so demonic that his neighbors denounced him to the Inquisition, and he spent some three to seven years in a dungeon (accounts vary). By the time he came out, other sailors had spread the habit of chewing, inhaling, and smoking tobacco across the Iberian Peninsula.

It was the medicinal value of tobacco, however, that really spread its use across the Old World. In 1571, a Spanish physician named Nicolás Monardes wrote *Joyfull News out of the New Founde Worlde*. The book was a compilation of Amerindian cures, including tobacco as a curative for thirty-six different ailments, ranging from wounds and open ulcers to toothaches, lockjaw, rheumatism, worms, bad breath, insomnia, and all manner of colds and respiratory problems. (In the following century, it would also be hailed as a protection against plague.) Medicinal tobacco was used as a poultice, ingested as a tea, or inhaled as snuff.

In Europe, inducing sneezing by inhaling various powders was a popular curative. Tobacco quickly replaced powdered pepper, myrrh, sneezewort, white hellebore, and spurge, for it had a soothing effect, relieving the sufferer's worries about his or her illness. Oviedo noted, however, that tobacco made people oblivious to their pain but did not cure them. He also noted that Africans, who were taken to the Indies as slaves, soon took to growing tobacco around their homes to smoke when they finished work, saying that it relieved their tiredness.

The tobacco plant is indigenous to the Americas; native peoples have been smoking and chewing its leaves for millennia. The Spanish carried it back to Europe, and smoking—both for pleasure and medicinal purposes—became widespread there in the sixteenth century. (Private Collection/Bridgeman Art Library)

Imperial Spain held a monopoly on tobacco sales until 1556, when a clergyman named André Thevet took seeds from Brazil to France. Although it appears that tobacco was growing in Portugal as early as 1512, it is not listed among Lisbon's market items until 1558.

Tobacco did not become popular in France until the French ambassador in Lisbon, Jean Nicot, wrote to Queen Catherine de Medici in 1559 lauding tobacco's curative properties. He sent some to the French court, recommending it for the queen's migraine headaches. Today, the genus of the herb still bears his name, as does tobacco's addictive alkali substance.

Tobacco in England's North American Colonies

Shortly after tobacco reached France, Sir John Hawkins and his sailors introduced pipe smoking to England. Documents indicate that Sir Francis Drake brought back the first plant specimens in 1573, but they made little impact, for smoking tobacco remained principally a sailor's habit until 1586. That was when colonists returning from the Virginia Colony were seen disembarking at Plymouth and smoking tobacco in pipes. It caused quite a sensation among the upper classes of England, especially when it became known that Sir Walter Raleigh himself was a pipe smoker. Just before he lost his head on the executioner's block in 1618, Raleigh smoked one last pipeful of tobacco. Some claim that the pipe was still clamped in his mouth when the axe came down. Ralph Lane, the first governor of the Virginia Colony, is credited with inventing the long-stemmed clay pipe used by Raleigh, although Native Americans had been using such pipes for centuries.

All American schoolchildren learn the story of the first permanent English settlement in America and how Jamestown would have been lost had it not turned to raising tobacco as an export crop. Captain John Smith, the colony's leader, was imprisoned by the Powhatans; according to his account, the native princess Pocahontas spoke up for him and saved his life. Pocahontas married John Rolfe, another of the Jamestown colonists, whom she showed how to plant, care for, cure, ferment, and age tobacco. Rolfe planted seeds from Trinidad and the Orinoco River regions, which were not as bitter as the standard variety grown by the native peoples along the Chesapeake.

The new tobacco's potential as a commercial crop was tremendous—there were already 7,000 shops selling tobacco in and around London by 1614, the year that the Jamestown colonists broke the Iberian monopoly by exporting a shipment to England. Ten years later, the Jamestown colonists sold 200,000 pounds of tobacco in London; in 1638, some 3 million pounds; and by the 1680s, more than 25 million pounds per year.

Most of the work of the Virginia Assembly during the early decades of the colony dealt with laws and taxes regulating the tobacco trade, including those concerning the indentured servants and African slaves required for the labor-intensive crop. In 1676, Virginia's Governor Berkeley learned the hard way

that the colonists would not support tobacco taxes that they considered to be too high—the ensuing Bacon's Rebellion was a foretaste of the American Revolution.

By the mid-1700s, the Middle colonies of North America were exporting half of the world's production of tobacco and had become dependent on African slave labor. Tobacco had become, very literally, a “cash crop,” whose leaves were used as cash. When a private ship arrived carrying ninety English women to be wed in Jamestown, the colonists paid with 120 pounds of tobacco per woman. Tobacco set the monetary standard in the colonies for more than two centuries, for its value was relatively stable. Each colony had its own currency, which was not always recognized by the others, but goods and services could still be traded in terms of the cost in gold of a pound of tobacco.

In recognition of tobacco's importance to the American economy and to the American Revolution, all “continental money” that was printed throughout the Revolution bore the stamp of a tobacco leaf. In fact, the Revolution was known as the Tobacco War along the East Coast because one of the causes was resentment against heavy taxes levied on tobacco by the British. Tobacco also was used as collateral to secure the loans from France with which the colonists financed the Revolution.

Back in France and England, pipe smoking had spread from sailors to the working class during the seventeenth century, so aristocrats switched to snorting snuff. Queen Charlotte (for whom Charlottesville, Virginia, and Charlotte, North Carolina, are named), wife of King George III of England, was known as Snuffy Charlotte, because she was so fond of it. “Dandies” at the royal courts carried exquisite snuff boxes decorated with cameos, miniature paintings, and jewels—and lace handkerchiefs to wipe away the brown slime that dripped from their noses as a result of their addiction.

Spanish nobles preferred smoking cigars, a habit that Napoleon Bonaparte and Lord Wellington's troops spread back to their home countries after the invasion of Spain in 1808. Spaniards and Portuguese had already introduced cigar smoking to Asia, Turkey, and Russia.

Hostility to Tobacco

The first to speak out against the “devil weed” were the popes of the 1600s, who forbade Catholic clergy and the faithful from using it because of its close connection with Amerindian “demonic” rituals and because the sneezing caused by taking snuff was considered to be too closely related to sexual ecstasy. Addiction to tobacco, however, proved stronger than the repeated threats of excommunication.

In 1603, King James I of England wrote “A Counterblast to Tobacco,” the first antismoking report in history. When he needed tax revenue, he still ended up encouraging the increased use of tobacco in England.

Napoleon Bonaparte, too, was against the rising use of tobacco (although he is said to have snuffed up to 7 pounds of it a month), but he was cognizant of its importance to his treasury. He wrote to his advisers, “This vice brings in 100 million francs each year. I will certainly forbid it at once—as soon as you can name a virtue that brings in as much revenue.”

Tobacco has a unique place in American colonial history. There was no other agricultural product that could even approach it in terms of its acceptance across a wide range of social categories, its use as a political tool, its utility for an incredible number and variety of practical applications and cultural rituals, and—perhaps most important of all—the revenues that it brought to its growers, manufacturers, distributors, and vendors, as well as in the form of taxes over the centuries. Tobacco is frequently touted as the reason colonists in North America were so expansionist, so greedy to take over more and more Native American territory, for tobacco quickly drained the soil of its nutrients, requiring “unspoiled” land.

Tobacco is fundamentally linked to the history of African American slavery, as well as to the causes of Bacon's Rebellion and the American Revolution. Tobacco set the monetary standard in the North American colonies for more than 200 years, and it continues to have a major influence on the South's income today.

Unfortunately, tobacco is also unique in that no other American agricultural product has fallen so fast and so far. Today tobacco is intimately linked with precedent-setting records for damage suits against the industry that produces and sells products known to cause cancer. Perhaps this is the real “Montezuma's revenge.”

Tools

Colonial Americans used and modified the culture of tools and tool making they had inherited from Europe. Tools were indispensable to a variety of economic activities and represented a considerable capital investment. The economic value of tools can be seen in probate inventories that carefully describe not only specific tools but even parts of a tool, such as metal harrow teeth.

Agricultural Tools

Early immigrants from England came with standard agricultural tools. These included the hoe, the forked hoe, and the spade for tilling; the sickle for harvesting; the flail for winnowing; and bill hooks for removing underbrush, as well as weeding tongs and shovels. Rather than making the entire shovel of metal, the usual practice was to make the body of the shovel of wood and sheath it with metal.

Plows began to appear in the 1630s and 1640s and were usually heavy, requiring several teams of oxen to draw them. Given the expense of a plow and oxen, many farmers could not afford them and either continued to hoe or hired a plow from a wealthier neighbor. Colonists originating in different parts of Europe would bring different styles of plow or other equipment. For example, English-derived plows had a flat ploughshare, a wooden coulter to cut the soil ahead of the plowshare, and two handles; Dutch farmers in America used “hog plows” with a pyramidal ploughshare, no coulter, and one handle. The lighter Dutch plow took less animal power to pull and worked better on good soil, while the English plow took much more power to pull but was more effective on poor and rocky soil. Most American plows remained heavy and inefficient until the development of the shovel plow, named after its shovel-shaped ploughshare, in the mid-eighteenth century.

Although the first tools were imported, there soon emerged local American tool making carried out by farmers themselves or by blacksmiths. Some smiths in centers of population came to specialize in tool making. The best tools were usually those imported from England, but most farmers could not afford them. The growing prosperity of the colonies meant that good tools became more widely distributed in the eighteenth century. Their quality also improved. For example, metal spades nailed to wooden handles replaced the seventeenth-century metal-sheathed wooden spades.

The most popular tool for harvesting grain in the areas of English settlement was the sickle, a curved metal blade with a short wooden handle. It required bending over to grasp the grain plant by hand and then swinging the sickle to cut it. Dutch farmers in New York and New Jersey used a device called a mathook, which in conjunction with the *sith*, or Flemish scythe, enabled them to harvest more efficiently without bending over. By the end of the colonial period, the cradle scythe, a much more efficient but heavier device, had come into use for grain harvesting in New England. The cradle scythe had a long straight blade at the end of the handle, with four wooden “fingers” about the same length as the blade and parallel to it. When wielded by a skilled practitioner, the cradle scythe not only cut grain more quickly than the sickle but also laid it out in a way that made for easy binding into sheaves.

The late eighteenth century and the time of the American Revolution saw much interest on the part of society's leaders in better agricultural tools as part of the overall movement for “improvement.” The newly founded American Philosophical Society heard papers on ideas for upgrading tools.

The early colonial iron industry could not support shipbuilding or other heavy manufacturing, but it was valuable in the production of pots and pans, nails and bolts, and basic hand tools. (Brown Brothers, Sterling, Pennsylvania)

One particularly vexatious problem that cried out for a solution was associated with the threshing of grain. The basic threshing tool was the flail, which

had existed unchanged for many centuries. Two pieces of wood were held together by a strap. The thresher held one piece and swung the other at the grain. It was exhausting and slow work. (The alternative was threshing by having heavy-hoofed animals walk over the grain, which also was slow and produced unclean grain.)

There were several attempts to mechanize threshing. In 1770, the General Assembly of Pennsylvania awarded a man named John Clayton (not the Virginia botanist of the same name) a patent for a threshing machine, but the machine proved ineffective. The Virginia Society for the Promotion of Useful Knowledge, shortly after its founding in 1773, awarded a gold medal to John Hobday, inventor of a threshing machine that he claimed was capable of threshing 120 bushels in a day.

The most publicized new tool of the time was the seed drill, introduced by the Englishman Jethro Tull and then improved by Connecticut clergyman Jared Eliot, the foremost American promoter of the “new agriculture.” Assisted by Thomas Clap, the president of Yale College, and Benoni Hylliard, a local wheelwright, Eliot made several improvements to the drill-plough. Eliot's version of Tull's seed drill combined a plough with a mechanism for the planting of seeds that produced more even planting than would be possible by hand. Despite the interest they attracted, the new machines had as yet little impact on the practice of farming.

Woodworking Tools

Nearly as important as agricultural tools were woodworking tools. Colonial America was rich in wood, particularly at the early stages of colonization, and the early colonists built an enormous amount from scratch. In 1622, the Virginia Company recommended that each immigrant family come equipped with two broadaxes, two felling axes, two steel handsaws, one whipsaw, two hammers, two augurs, six chisels, two stocked braces, three gimlets, two hatchets, two froes, nails, and a grindstone. If all this equipment were actually brought along, it would have represented a substantial portion of an immigrant family's economic outlay.

No woodworking tool was more important to the development of America than the axe. Axes show up very early in the European invasion of North America, as small axes and hatchets were common trade goods of Europeans dealing with Native Americans. These axes were traded to the natives by Spanish, French, and English traders. They were known as Biscayan axes if they were Spanish and as Hudson Bay axes if they were English. Given the Native Americans' lack of sharp metal tools, axes were quite valuable in exchange.

The “felling axe” for chopping down trees was among the most common axes used by the settlers themselves, and it underwent substantial improvement in the British colonies from its European original. The American felling axe developed by shortening the blade and creating a heavier (and sometimes steel-reinforced) poll, on the opposite side of the handle of the blade, to counterbalance the weight of the blade and make the axe easier to swing; it also made the reverse of the blade a more effective hammer. The body of the blade of the American felling axe was composed of iron—charcoal iron being useful for this purpose—with a steel cutting wedge as wide as 1.5 inches welded on. When the edge dulled, it was replaced by welding a sheet of steel on one side of the axe, a process known as “steeling” the axe.

Another common kind of axe was the hewing or “goosewing” axe, with the handle bent away from the blade to enable the user to chop wood without having his hand strike the wood. Goosewing axes often had the maker's name inscribed on them, while felling axes did not. The mortising or “posthole” axe, with the blade at right angles to the haft, was used to chop the square mortises into wood for making a mortise-and-tenon joint.

Although axes were made in America, many fine woodworking tools used by carpenters, joiners, cabinetmakers, turners, and other workers in wood continued to be imported from Britain. (One exception was the plane, the most common woodworking tool, which was often made by woodworkers themselves out of maple with a metal blade.) The average master woodworker spent 10 to 20 pounds on tools. Woodworkers sometimes supplemented their income by selling imported tools, and the Continental Congress was concerned by how the Revolutionary War's severing of economic ties to Britain would adversely affect the American economy by ending the import of British tools.

Some Americans took up commercial toolmaking. Among the earliest was Francis Nicholson of Wrentham, active in the first half of the eighteenth century and specializing in joiners' and carpenters' planes.

Textiles

Another important class of tools, those used in textile manufacturing, changed very little in the colonial period. Spinning wheels were uncommon in the early phases of colonization but much more common later. They were divided into two types, the “walking wheel” for spinning wool into yarn and the foot-operated treadle wheel (also known as the Dutch, linen, or foot wheel) used for spinning flax. Both types of spinning wheels were made of wood, and their operation was quintessentially “women's work.”

Once spun, yarn was gathered and measured by hand on wooden reels known as “niddy-noddys.” There were also hand-cranked reels. The thread was then woven into cloth on wooden looms.

Spinning took on a political aspect during “homespun” campaigns, when Americans were encouraged to wear American-made clothes rather than imports from Britain. The mechanization of textile manufacturing, which would revolutionize the American economy, occurred only after the American Revolution.

Tordesillas, Treaty of (1494)

Christopher Columbus's 1492 voyage on behalf of the Spanish Crown caused serious diplomatic problems because of previous Portuguese explorations in the South Atlantic and Indian Oceans. Papal bulls issued in 1452 and 1454 by Pope Nicholas V gave the Portuguese the right to subjugate any infidels they encountered in the course of their explorations and vaguely defined Portugal's possessions as those lands on Africa's "south coast and east side." Additionally, a bull issued in 1481 gave spiritual jurisdiction over all new discoveries to the Portuguese Order of Christ, the religious organization founded by Prince Henry the Navigator.

Until Spain's sponsorship of Columbus, the Portuguese had been unchallenged in their voyages down the coast of Africa and in their claims to the Azores, Madeira, and Cape Verde islands. A subsequent treaty between Spain and Portugal, signed in 1487, confirmed Portugal's possession of the "Indies" and the "seas as far as the Indies."

Upon Columbus's arrival in Seville to report his discovery and claiming of Hispaniola, Ferdinand and Isabella of Spain dispatched ambassadors to Pope Alexander VI, appealing to his authority as head of the Roman Catholic Church to validate Spanish claims and define Spanish and Portuguese spheres of exploration. The pope, a Spaniard, quickly issued three papal bulls over the summer of 1493, giving Spain Columbus's discoveries and defining the line between Spain and Portugal's claims as 100 leagues (1 league equals 3 miles) southwest of the Azores and Cape Verde islands. Portuguese King Jao II was furious. The pope's decision defined no westward limit, thus cutting into Portuguese claims in India, and limiting Portuguese navigation to routes around the Cape of Good Hope.

Instead of relying on the Vatican's pronouncements, the Spanish and Portuguese monarchies exchanged ambassadors in order to arrange a state treaty to address the problem. The Spanish accredited Garcia de Carvajal and Rodrigo Maldonado de Talavera, an expert on Columbus's original proposal to cross the Atlantic, while Portugal sent Ruy de Sousa and Arias de Almadana.

On June 7, 1494, in the Castilian town of Tordesillas, the signatories agreed to a treaty that specifically excluded the papacy from the negotiations and reserved authority for dividing discoveries to the nations claiming them. These terms were meant to cover all present and future territorial claims as well as those under discussion. The line of demarcation was set at 46 degrees 37 minutes west, or 370 leagues west of the Cape Verde islands, a significant difference from the 1493 papal bull. The two nations also agreed to dispatch a joint surveying party within ten months.

Although this provided an immediate solution to rival claims, the Treaty of Tordesillas was still sufficiently vague to cause enduring problems, especially after Portugal claimed Brazil in 1500. Spain and Portugal hotly contested the point from which the 370-league line was to be measured: the most westward Cape Verde island or the center island in the chain, a specific point that affected Portuguese settlements in the western part of Brazil (where surveying a border in the middle of the Amazon rainforest was nearly impossible). Claims on the Molucca Islands were also at issue. In addition, extension of the line of demarcation into the Eastern Hemisphere divided Asia, allotting China to Portugal and Japan to Spain.

The Vatican was incensed at being left out of the treaty, and Pope Julius II did not approve the agreement until 1506. The treaty remained in force, despite British and French exploration and settlement, until the two Iberian powers dissolved it by mutual agreement in 1761.

Townshend, Charles (1725–1767)

Author of the 1767 duties that bore his name, Charles Townshend was an aristocratic English statesman who rose to prominence through his often unscrupulous behavior. The taxes he proposed levying on the colonies led to active resistance against English rule, doing much to bring about the American Revolution.

Born on August 29, 1725, the second son of Charles Viscount Townshend, young Charles was educated at Leyden University in Holland. Upon his return to England, he sat on behalf of Great Yarmouth in Parliament from 1747 to 1761. Over the course of his political career, Townshend was able to make a name for himself by allying with any group or individual offering him the best chance for future success. His shifting allegiances earned him the nickname “weathercock” among friends and opponents alike.

By 1749, Townshend had been given a commission on the Board of Trade. While serving in that capacity, the young upstart distinguished himself in a debate over proposed changes to the marriage law. His political future seemed bright indeed as he was made lord of admiralty in 1754 and appointed treasurer of the chamber two years later under William Pitt, the new secretary of state.

True to his nickname, Townshend shifted his allegiance from Pitt to the new secretary of state and John Stuart, Earl of Bute, and he was awarded the post of secretary of war in 1761, which allowed him to be active in the conduct of government business in the House of Commons. After resigning this last position, he was appointed president of the Board of Trade in February 1763. When Grenville succeeded Bute in April, Townshend refused a post after his nominee failed to win a commission in the new administration. Although he later accepted the position of paymaster general, which he continued to hold through Rockingham's ministry, he was an outspoken critic of both administrations.

In 1766, Townshend became part of William Pitt's cabinet as his chancellor of the exchequer. Due to ill health, Pitt was unable to keep his subordinates under close watch. As the new chancellor, Townshend used his post to get a substantial share of a public loan and to rise above many of his colleagues, seizing leadership of the cabinet.

The problem of raising revenue from the colonies to defray the expenses of maintaining British troops and forts on the Western frontier fell squarely on the shoulders of Charles Townshend, as a leader in the new administration. Despite its best efforts, Parliament had never been able to levy an effective tax in the colonies. The Stamp Act of 1765 was repealed before it had yielded any profits. The revenue acts proposed by Townshend in May 1767 would include a port duty on glass, lead, painters' colors, paper, and tea, establish a custom's commission to oversee the laws of trade, and suspend the New York Assembly until it complied with an earlier quartering act. Parliament, desperate for money and hoping that Americans would respect this new tax, passed the Townshend Revenue Acts on June 29, 1767.

The provisions of the new acts infuriated Americans. Money gained from the taxes was to be used against Americans by paying the salaries of colonial governors and judges who were independent of the assemblies. Americans were also fearful of Townshend's reorganization of the custom's office. Over the several preceding decades, custom officials residing in England often delegated their duties to agents in the colonies, who were easily bribed by American smugglers. The new Customs Commission would put a stop to smuggling and be easily corruptible, as those officers seizing a vessel were entitled to one-third of the profits from the sale of the cargo. These officers also were given blanket search warrants, known as Writs of Assistance, which Americans rightfully considered an invasion of privacy. Finally, by dissolving the legislative functions of the New York Assembly, Parliament, in the eyes of many, was overstepping its bounds in an effort to gain supreme authority over the colonies.

To most Americans, the Townshend Revenue Acts exemplified the carelessness of parliamentary legislation. Like the Stamp Act before it, the proposed measures were immediately resisted. Riots took place in colonial towns, nonimportation associations were formed, and royal officials were scoffed at. The economic sanctions and other forms of resistance led, by April 12, 1770, to a repeal of all these duties except the tax on tea.

England's Chancellor of the Exchequer Charles Townshend (portrayed by Sir Joshua Reynolds) sponsored the eponymous legislation in 1767 that imposed duties on goods imported into America and sparked colonial protests. (Private Collection/Philip Mould, Historical Portraits Ltd., London, United Kingdom/Bridgeman Art Library)

Despite his many abilities, Charles Townshend's career was marred by inconsistency of character, untrustworthiness, corruption, and, in the end, failure. On September 4, 1767, before the duties that bore his name were ever enacted, he died of typhus at the age of 42.

Townshend Acts (1767)

In the aftermath of the Stamp Act Crisis, the British government continued to face a looming debt from the Seven Years' War and political pressure to prove Parliament's ability to tax the American colonies.

From 1766, William Pitt, Earl of Chatham, headed the ministry, with Charles Townshend at the Exchequer, or finance ministry, and two supporters of the Marquis of Rockingham, General Henry Conway and Lord Shelburne, in the cabinet. Rockingham was also sympathetic to colonial interests. This was a deliberate coalition of men, some of whom, like Pitt, had supported the repeal of the Stamp Act, and others, like Conway, had been long-time colonial sympathizers. Townshend suffered a severe financial defeat at the hands of Rockingham, however, whose supporters forced a 20 percent reduction in the customary land tax from 4 shillings to 3 shillings in February 1767. Thus, the need for revenue became more crucial than ever.

In March 1767, Townshend proposed a new set of colonial taxes on a range of luxury items, using the argument that the Stamp Act had been an internal tax, but that the new proposal was external, covered under the Declaratory Act, and charged only on items purchased willingly by the colonists as imports. Townshend also gambled that the items themselves—fruit and wines from Spain and Portugal, tea, paint, pane glass, and paper—were likely to affect only the wealthy, avoiding agitating the level of society that had protested the Stamp Act.

Eventually, merchants lobbied successfully for the removal of the wine and fruit from the act, arguing that the proposal contradicted the Navigation Acts by

allowing Iberia to trade directly with America. Thus, on June 29, 1767, Townshend presented his new tax bill to the House of Commons, which, thinly attended at the end of the spring session, passed it without much debate.

News of the new taxes reached America during the summer recess of the colonial assemblies, restricting protests to personal appeals and petitions. In London, despite the fierce presentations of pamphlets by Benjamin Franklin and Arthur Lee, who wrote as Junius Americanus, the entire issue was overshadowed by the outrageous political maneuvers of John Wilkes and his bids to reenter the House of Commons.

In America, radicals like Samuel Adams attempted to organize boycotts like those that had pressured for a repeal of the Stamp Act. Merchants and many of the Southern colonies, however, did not come out in enthusiastic support, although some patriots showed their affiliation by letting their houses go unpainted and refusing tea. London merchants, who had found expanded European markets during the 1765 boycotts, were not badly hurt by these early protests and did not add their voices to those of the colonists for repeal.

What really began to threaten colonial leaders were a series of associated bills presented by Townshend and passed by the House of Commons. Revenue from the new taxes would not go to pay the war debt or the costs of garrisoning the army in America, but to make colonial officials independent from the legislatures. Additionally, there would be three new Admiralty courts to prosecute smuggling without juries in Charles Town, Philadelphia, and Boston, as well as Halifax, and an American-based Board of Customs Commissioners in Boston. Writs of Assistance, a kind of general warrant used by customs collectors in New England, would be expanded throughout the colonies; these were feared as an excuse to arrest without cause and hold colonists indefinitely.

Massachusetts, its assembly back in session in October, voted a resolution endorsing boycott and defiance; it subsequently sent this resolution out as a Samuel Adams-authored circular letter to the other colonies. When instructed to rescind the document, the assembly voted refusal and was dismissed by the London ministry. Members of the assembly who had voted to obey the government's orders were harassed and turned out of their seats.

Meanwhile, all of the other colonies voted support for the circular letter, although their actual commitment was lukewarm, since some already taxed to pay their officials and they were not adversely affected by the taxes. In Pennsylvania, lawyer John Dickinson published a series of *Letters from a Farmer in Pennsylvania* in the *Pennsylvania Gazette* between December 1767 and February 1768, arguing that although Britain could regulate imperial trade, no tax, internal or external, could be levied on the colonies without their consent, a more stringent position than previously presented to the British authorities.

Townshend, who died unexpectedly of typhus on September 4, 1767, did not live to see his policies enforced. He was succeeded at the Exchequer by Lord North.

The ministry, appalled by Massachusetts's defiance, moved 4,000 troops into Boston—significantly, two regiments recently employed in Ireland to put down a tax protest on malt—and dispatched naval patrols to Boston Harbor. Samuel Adams advocated resistance to the troops, but they landed without incident and took up garrison duty in the resentful city, which was required to quarter and feed them. This situation led directly to the Boston Massacre of 1770, as colonial dissatisfaction took the form of riots over seized ships (John Hancock's smuggler, *Liberty*, was taken) and harassment of customs officials, leading to more hostile relations with the troops.

Moved by Dickinson and Adams and by fear of the growing enforcement powers of the government in London, increasing numbers of colonists signed nonimportation agreements against *all* British goods, which eventually convinced merchants to lobby the ministry in 1770. All but one of the Townshend Acts were repealed on April 12, 1770. For the British politicians involved, the action was less attributable to colonial pressure than to internal British politics, as Lord North used the repeal to establish his new cabinet. Significantly, the tax on tea, the least lucrative of the items, was kept as a symbolic proof of Parliament's power to levy taxes on the colonies.

Trade

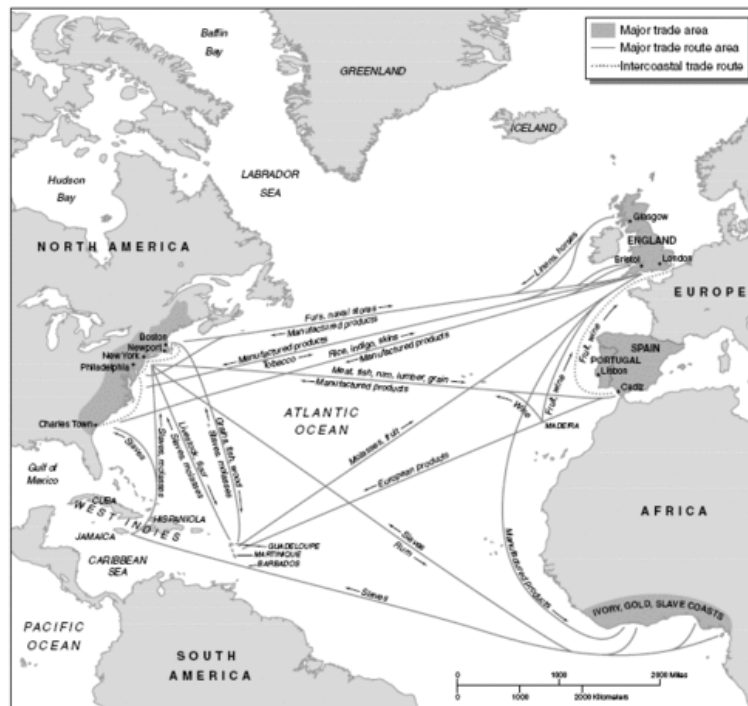

After 1492, Spain instituted an economic system of transatlantic trade between the mother country and its colonies known as mercantilism. Under this system, all trade was regulated for the benefit of the parent country. Columbian exchange (trade between the “Old World” and the “New World”) proved to be very profitable for Spain. Gold, silver, and other precious resources fortified the Spanish Empire for more than a century.

The defeat of the Spanish Armada in 1588, however, encouraged other European countries to challenge Spain's position in the Americas. The British sent a group of colonists to the North American continent, but the venture was a complete failure. The Roanoke colony mysteriously vanished without a trace. Britain's second attempt, at Jamestown, however, was a success and secured a firm footing for continued British colonization of the North American Eastern coast.

British Colonies

Jamestown was founded in 1607. Had it not been for a friendly local Native American tribe sharing their food with the settlers and teaching them how to plant crops, it, too, would have failed and might not have led to a third attempt to colonize the Americas. These ventures were, after all, great financial investments made by private citizens with the king's permission. Unlike the Spanish, however, the British did not find an abundant supply of precious metals. Instead, John Rolfe learned from Native Americans how to cultivate tobacco, a plant native to the Western Hemisphere, and he began shipping it to England. By 1620, tobacco had become very popular in England and was in high demand. It quickly became the South's chief crop.

In general terms, the Northern colonies prospered through shipbuilding, fishing, and trade, because neither the cold climate nor the hard, rocky ground was particularly conducive to agriculture. On the other hand, the Southern colonies had an economy based on agriculture, because the environment was appropriate for growing rice and tobacco. In the years that followed, the colonial economy became much more diversified, and Great Britain continued to capitalize on it. England purchased over half of all the crops that the colonies produced for market. Also, almost all imports to the colonies came from England.

Trans-Atlantic Trade, 1700. *The so-called Triangle Trade between Europe, Africa, and North America was, in fact, a far more complicated set of routes by 1700. A variety of goods were being traded between many different regions.* (Carto-Graphics)

By 1770, the main exports of the New England colonies were fishing-related products (dried fish, pickled fish, and whale products) and wood. The main exports in the Middle colonies were grains and grain-based products (rice, wheat, and flour), wood products, and iron. The Chesapeake colonies provided most of the tobacco and some grains as well. In the lower Southern colonies, agricultural products made up most of the tradable items, which included grains, indigo (a blue, plant-based dye), and wood.

French Colonies

Since the early 1600s, the French had built a sizable fortune based on the fur trade. In the 1700s, the British also sought to cash in on fur, and they began to do some trapping in disputed French/British territory. The military clash that followed announced the coming of the French and Indian War (1754–1763). After the war, the British victory afforded the colonists the ability to venture into newly acquired territory in search of furs. Furs were also bought from Native Americans, who traveled to the colonial frontier to trade. However, for various reasons, including a diminished supply of the most sought-after beaver furs, the colonial fur trade was never as prosperous as the French enterprise had been. The fur trade, which had been of major

economic importance to the French in North America, accounted for only a small percentage of all British colonial trade.

Just like the Spanish, the British North American colonial system followed the rules of mercantilism, which were aimed at enriching the mother country. According to the general guidelines, the colonies were to supply England with raw materials such as tobacco, indigo, furs, grain, and timber. Furthermore, the colonies were expected to purchase English manufactured goods such as glass, clothes, dishes, weapons, and tools.

In order to gain greater control over colonial trade, Parliament passed a series of laws known as the Navigation Acts. The Navigation Act of 1651 stated that all goods sent to England or its colonies had to be transported by British-made ships. The purpose of the law was to minimize the possibility of other European nations benefiting from British colonial trade. The Navigation Act of 1660 stated that certain enumerated items not produced in England (such as tobacco, cotton, indigo dye, and sugar) could only be traded with England and its colonies. This measure sought to get rid of any competition for coveted colonial goods. The Navigation Act of 1663 (Staple Act) stated that all European imports to the colonies had to pass through English ports. Under this act, ships carrying goods from Europe to America had to dock in England and pay a duty before being allowed to proceed. Because of this act, England became the center for colonial trade. With the Navigation Act of 1673 (Plantation Act), England, which already controlled imports, began to control exports as well. The latest act required that ships leaving colonial ports pay a tax on enumerated goods.

In 1675, King Charles II organized the Lords of Trade, a small group of advisers who were charged with overseeing British trade. In 1696, the Board of Trade, which replaced the Lords of Trade, was created by King William III. Its function was to enforce the Navigation Acts. Many colonial merchants, however, found the acts too restrictive and unfair, and they ignored them whenever possible. Consequently, smuggling—importing or exporting goods illegally—was common. While these limits on trade frustrated some colonial businessmen, they went a long way toward boosting the colonial shipbuilding industry. The increase in colonial ship acquisition led to an increase in colonial trade. In the last part of the seventeenth century, colonial merchants developed a series of trade routes known as the triangular trade. Triangular trade (not literally triangular in shape) was responsible for the transporting of slaves, goods, and ideas found in books and newspapers. Most of these routes fell within the guidelines of mercantilism, but some did not.

From the early 1600s, British colonialism in North America was based on trade, as depicted in this engraving of the West Indies by Theodore de Bry. The aim of the mercantile system was to enrich the mother country with supplies of sugar, tobacco, indigo, cotton, and other raw materials. (Library of Congress/Bridgeman Art Library)

Triangular Trade

In a very common triangular route, colonial ships carried rum and iron from New England to Africa. Once in Africa, the cargo was traded for slaves and gold, which were then shipped to the British-held West Indies, where they were traded for sugar and molasses. Finally, the sugar and molasses were shipped to New England and made into rum, and the process started all over again. A second frequent route involved the shipping of colonial grain and lumber to the West Indies, where they were traded for sugar, molasses, and fruit. These goods were then taken to England and traded for manufactured items, which would be shipped to New England.

On occasion, however, colonists strayed from governmental mandates and engaged in smuggling. According to British trade laws, for example, colonists were to buy sugar and molasses only from the West Indies. The demand for these items was so great, however, that colonial merchants sometimes illegally purchased them from the French, Dutch, and Spanish.

The Spanish and the Portuguese were the first to import slaves into the Americas. It has been estimated that, before 1700, Spain and Portugal shipped over 1.5 million slaves to South America. In 1619, a Dutch ship introduced slaves to North America, and, by 1660, when the supply of indentured servants began to wane in the British colonies, slave labor began to look like an attractive alternative. A large labor force was required for growing tobacco in the Southern colonies and producing sugar in the West Indies. Also, as opposed to indentured servants who were bound to service for seven years, slaves could be bound for their entire lives. Furthermore, indentured servants came to the colonies when they chose to come, but slaves could be imported at will to meet the labor demands of any given time.

The first African slaves were captured in wars among African states and then sold to Europeans. By 1700, however, most slaves were kidnapped from the interior of Africa and transported to the African coast by powerful African kingdoms, such as the Dahomey.

The British slave trade, which lasted more than a century, became a very profitable business, and by 1740 more than 40 percent of the population of the Southern British colonies was of African descent. It has been estimated that over 2 million Africans were transported to the British colonies, and almost 12 million were transported by Europeans to North and South America during the existence of the slave trade.

Mercantile System

Early on, the British colonists lacked the means of manufacturing finished goods. Consequently, the colonists imported most of their finished goods from England and Europe. However, the mercantile system put the colonies at a disadvantage and usually left them with a trade imbalance.

After 1660, for example, England raised taxes on New England fish, flour, wheat, and meat in order to protect merchants in England who sold the same products. New England timber, furs, and whale oil, however, were not placed under the heavy burden of taxation. Consequently, New England colonies could still trade, but their trade was kept from its full potential. Basically, the system worked as England intended. New England bought more from England than they sold. The colonies attempted to use triangular trade to combat the trade imbalance, but trade legislation continued to give England the advantage.

Even under the trade imbalance, however, many colonial businesses prospered, and, even under the yoke of mercantilism, many colonists began leaning toward self-sufficiency by making products in their homes. In order to protect the sale of English-made goods, Parliament passed laws that restricted manufacturing in the colonies. Colonists were allowed to make goods for their own personal use, but they were prohibited from selling these goods anywhere else, including England or any other colony. In 1699, for example, Parliament passed the Woolen Act, which prohibited the colonies from sending wool to England or to other colonies. The Iron Act (1750) kept the colonists from making their own iron. Because of this act, the colonists had to send their raw iron to England and buy finished iron products from English iron mills.

Trade made the colonies what they were: agricultural centers, commercial centers, and, overall, industrious centers. The mercantile system worked well for England. It provided ready markets for English-made goods, and it supplied the mother country with raw materials not available in England. It was no wonder that England spared no expense in the defense of the colonies during the French and Indian War or that England could not stand to lose the North American colonies during the American Revolution.

Trade transformed the colonists from dependent subjects to independent and industrious citizens. Before the American Revolution, colonists thought of themselves primarily as members of the British Empire. Many felt allegiance only to their own colony and mother country. There was little sense of a unified colonial entity. Many differences divided the colonies, and many rivalries existed.

In the midst of all this, the economics of trade within the colonies created the first real bond among them. Because each colony belonged to a distinct regional economy, each region had something unique to offer another region. For example, fish from the New England colonies was readily exchanged for flour from the Middle colonies, indigo from the lower South was traded with all of the other regions, and so on. In fact, in the eighteenth century, even though foreign trade was more profitable, domestic trade accounted for greater volume. As the American Revolution approached, the economic bonds that existed for over a century became the seed from which political and military bonds grew.

The French and Indian War had a profound effect on colonial trade laws, and trade regulation became a major factor in bringing on the crisis of revolution. The expense of waging the French and Indian War and maintaining troops in North America after the war had to be addressed, so taxes were raised in England. Furthermore, King George III and his ministers believed that the colonists should share the monetary burden of their own defense. Consequently, for the first time in colonial history, Parliament taxed the colonies directly.

In 1764, the Molasses Act (1733), which was often ignored by the colonists, was replaced by the Sugar Act. The Sugar Act, which placed a tax on a variety of foreign products such as textiles, wines, and coffee, cut the sixpence per gallon duty on sugar in half. Lord of the Treasury George Grenville hoped that the reduction of the tax would discourage smuggling and remove the temptation to bribe customs officers. Another notable distinction between prior trade laws and the Sugar Act was that the new act was rigorously enforced. The Stamp Act (1765), which also taxed the colonists directly, placed a tariff on all printed materials, including newspapers, pamphlets, almanacs, bonds, leases, deeds, licenses, insurance policies, college diplomas, dice, and playing cards. This act angered all sectors of colonial society.

Colonists found the new laws unbearable and sent petitions to Parliament, led protests, and organized boycotts. In 1770, a Boston demonstration against the new trade regulations got out of hand and culminated in the Boston Massacre. In 1773, colonists boarded three ships in Boston harbor and flung the tea cargo overboard rather than pay the tea tax. As the crises worsened, Thomas Jefferson drew up the Declaration of Independence (1776), which declared the colonies an independent nation free, among other things, to regulate its own trade.

Transportation, Land

One challenge facing early American colonists was maintaining communications across a space much larger than that which they had known in England or Europe. Attending Sunday services, carrying goods to market, or even courting could involve many miles of travel.

Although travel by water took up much of the need, many Americans did not own boats or live close to navigable waterways and therefore had to travel on land. Colonial Americans, like their native predecessors and contemporaries, were willing to travel long distances by foot, although as forests were cleared and more horses were brought to the colonies, those who could afford it traveled on horseback.

The paths used by the colonists often followed older Native American routes. One native pathway that became a major thoroughfare in early colonial America was the Bay Path, which went from Cambridge to Springfield, Massachusetts, and the Connecticut River. Paths were marked by blazes, sections cut out of bark of trees along the way—hence the term “trailblazing.” These bright patches showed the traveler the way.

Roads

Although initial efforts at colonization often followed waterways, subsequent expansion took colonists into areas more difficult of access as traffic grew heavier. Road building, rather than trailblazing, became a necessity, and many new roads were laid out by surveyors rather than following native trails. In most of colonial America, however, roads remained poor or virtually nonexistent. They frequently crossed private property, making it necessary to dismount and mount to open and close gates. Passage in wheeled vehicles over rocky country was jarring and unpleasant. Roads were also unmarked, making it easy for people to get lost. Bridges were uncommon owing to their expense, and crossing bodies of water was generally accomplished by ferries or fords.

Differences between governments also hindered communications. A plan to institute a postal service between Boston and New York during the Second Dutch War came to nothing, partly because there was no road between these two major cities, one English and one Dutch. Once roads were built, they had to be maintained, and this responsibility fell to the local authorities. The British government took no responsibility for the state of roads, and even provincial assemblies usually deferred to local bodies.

Labor was found for road maintenance by means of a draft, a method with a long tradition in Europe. For example, in Pennsylvania, where roads were somewhat better than in the rest of the colonies, before 1762, all male inhabitants were legally required to spend a few days each year on roadwork. In 1762, a system was established whereby men could buy their way out of the obligation, and that money was used to hire laborers.

Despite the poor quality of the roads, early American travelers had some advantages over their European contemporaries (and many European roads were just as bad). Early America had little “highway robbery,” although natives might attack travelers in some times and places. Farmhouses often offered hospitality in areas lacking inns or taverns. Travelers were essential in circulating news to isolated farmers in a society without mass communications.

Vehicles

By the eighteenth century, Americans could travel in wagons, in carriages, and—during the winter—on sledges and sleighs. (Winter travelers also benefited from snowshoes, a Native American invention.) With the exception of some coaches, all of these vehicles were American-made.

Coaches were the most prestigious of vehicles, restricted to persons of the highest social status. The earliest coach to be mentioned in the British colonies was that which, Anthony Colve, the governor of New Netherland, presented to Sir Edmund Andros, the incoming governor as the colony passed

from Dutch to British rule. Some of the first to be seen in America were vehicles of state employed by colonial governors sent from England, from whom they diffused to the American upper classes.

Private coaches remained restricted to the elite; the Massachusetts tax list of 1753 includes only six. Of somewhat lower status was the two-wheeled calash. Another vehicle, the chaise, or as it became known in America, the "shay," was a light two- or four-wheeled carriage; it was introduced between 1710 and 1730.

All of these horse-drawn vehicles were largely urban phenomena, except for a few owned by wealthy rural Southern planters. One evidence of the spread of coaches and other vehicles in the South is that while the Virginia ferry law of 1702 mentioned only rates for people and horses, the revision of the law in 1720 added rates for two- and four-wheeled vehicles.

As bearers of status, these coaches and other vehicles were not designed in merely functional terms. Strict Puritans suspected them as worldly vanities and sometimes went through agonies of conscience about purchasing them. Riding a coach or carriage on the Sabbath was felt to be particularly damnable.

Use of horse-drawn vehicles was not restricted to individual owners and their families. Stagecoaches and other forms of public transportation emerged in the early eighteenth century. By 1716, there was a fortnightly run between Boston and Newport, although it lasted only a few years. Regularly scheduled wagon-based transit began in New Jersey, building on the freight wagons that traveled between the coast and the Delaware River.

By 1750, there was a regular New York-Philadelphia run, traveling by land and water and taking about three days. Philadelphia-Chesapeake lines emerged in the 1760s, taking various routes to different endpoints, although over time Baltimore dominated. The first successful New England stage route was between Boston and Portsmouth in 1761, and a Boston-New York stage route was finally established in 1772. In addition to these intercity routes, there were also local routes in the areas of Boston, New York, and Philadelphia.

Wagons and Carts

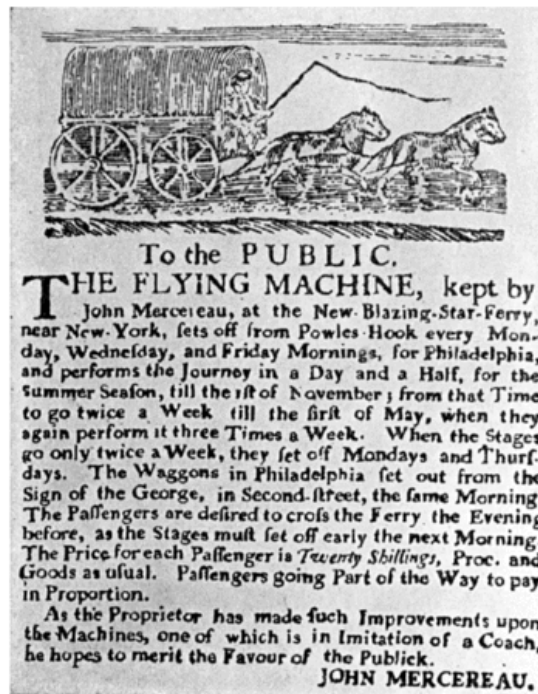

Not only people but also goods moved overland in horse-drawn vehicles. Wagon and cart technologies differed between the various European groups that settled in North America. English settlers made greater use of carts, Germans of wagons. The Swedes had a unique practice of using cross sections of tree trunk as cartwheels.

One vehicle that originated in America and came into widespread use in the late colonial period and beyond was the Conestoga wagon, named for the Conestoga River Valley in Lancaster County, Pennsylvania. The term appears in the early eighteenth century and was originally applied to the wagons that farmers used to take their goods to Philadelphia. (A Conestoga Wagon Inn had appeared on Philadelphia's Market Street by 1750.) The defining features of the Conestoga wagon included a cloth cover held up with eight to twelve wooden hoops, a curved body with an upswept front and back, wheels with a diameter of 54 inches or greater, and wooden axles. The manufacture of these wagons was concentrated in southeastern Pennsylvania, and it seems to have originated in the German farmer community. The necessity of protecting farm produce from the weather in the four-day journey from Lancaster to Philadelphia encouraged covering the wagon. The Conestoga received wider exposure in 1755, when General Braddock hired over 150 farm wagons for the advance against Fort Duquesne. Increasing use of wagons led to the widening and smoothing of roads to accommodate them.

Whether they arrived in cities in wagons or on boats, once there, goods were frequently maneuvered through narrow, winding streets on carts. Carts and their operators were vital to the commerce of colonial America. The profession of cartman carried some status beyond that of most workers. New York City's cartmen were, from 1695, freemen of the city and held some lower municipal offices. Another mark of the status claims of New York cartmen was that, in 1677, African Americans were barred from being cartmen, although they could work for cartmen as employees or slaves. Cartmen did not freely negotiate their fees. The Common Council of the city regulated the size of carts and cartmen's charges, particularly for hauling firewood.

Roads and War

The increasingly technological wars of the British, French, and their Native American allies in the eighteenth century created an incentive for road building. Wide roads were necessary to move large bodies of regular troops, along with their supplies and siege cannon.

Advertised as "The Flying Machine," John Mercereau's stage wagon cut the travel between Philadelphia and New York to a day and half in 1771. (Brown Brothers, Sterling, Pennsylvania)

Another force driving the improvement of roads in the midcentury was the improvement of the postal service after British authorities finally established such a service covering all the continental colonies in 1751. (The postal service itself was considered to be contributing to the military organization of the colonies.) Benjamin Franklin, appointed co-deputy postmaster in 1753, was particularly active, traveling extensively through the Northern colonies, inspecting post offices, and suggesting new routes and procedures. He devised a crude cyclometer that he hitched to the back of his chaise in order to measure the distances along the roads, and he laid out milestones and encouraged others to do so.

Improvement of transportation and land communication between the colonies was one force tending to colonial unity before and during the Revolution. The publication of a full atlas of America's roads, however, waited until 1789, several years after the Revolution, when Christopher Colles's *A Survey of the Roads of the United States of America* was published.

Transportation, Water

Transportation by water was central to the colonial experience, from Christopher Columbus to the British Armies carried to America in the Revolutionary War. The Americas were inaccessible by land from Europe, so every first-generation colonist's experience of America began with a long ocean voyage. Sea transportation played only a slightly less prominent a role in the lives of the American-born colonists. Communication, trade, and visits to Europe and to the West Indies depended on ships.

Given the cheapness of transportation by water as compared to that by land, America's economic development was largely dependent on her access to markets, sources of goods, and emigrants by water. Although few of the original settlers were seamen, British Americans themselves developed from relatively early times an active shipbuilding industry and vigorous ports. Fishing, whaling, and merchant shipping (the last encouraged by the Navigation Acts) absorbed the labor of many colonists.

Crossing the Ocean

The early colonization of America benefited from both navigational and design improvements in European ships; it also posed new challenges. The magnetic compass, used to find the direction of a ship, was already in general use in the late medieval period.

The *Casa de la Contratación*, founded in 1503 to regulate Spanish movement to and from the New World, trained pilots and captains in the arts of cartography and navigation, systematizing the information Spanish captains gathered from the Americas. The *Casa de la Contratación* was part of a larger European movement to make navigation a more textual body of knowledge, as opposed to something passed down orally. The Spanish also hoped to enforce their early monopoly over the New World by restricting their European rivals' access to navigational and cartographic information. This strategy did not succeed.

Crossing the ocean was dangerous and unpleasant, particularly in the early decades of colonization. Ships were overcrowded, unsanitary, and often full of rats and disease. The diet was poor, consisting on British ships mainly of easily preserved foods such as biscuit and salt beef, although sometimes live animals were brought on board and slaughtered during the voyage or ocean fish were caught and eaten.

Conditions improved during the eighteenth century with the exception of voyages bringing convicts and, above all, slave voyages. Slave ships were notorious for disease. The death toll among sailors was high, even higher than among the slaves on some voyages. Storms were also very dangerous.

The lightweight birch bark canoe, used by native peoples to travel the lakes and rivers of the continent's interior, was adopted by Europeans. It proved indispensable in the exploration and settlement of the frontier. (© Peabody Essex Museum, Salem, Massachusetts/Bridgeman Art Library)

One factor that particularly improved transoceanic voyages was the gradual replacement, during the seventeenth century, of the old southern route, in which ships sailed to the Caribbean and then up the coast of North America. Instead, the new route went directly across the Atlantic, approximately on the great circle that was the shortest distance. While it could take three to four months to reach America by the old route, a journey by the new outbound route might take only seven to eight weeks, depending on the weather. The return crossing to Britain was shortened even more by the Gulf Stream and prevailing westerly winds.

Given the value of goods transported across the sea, security for water-borne trade and travelers (there were no "passenger ships" in the early modern period) was always a problem. Piracy diminished rapidly after about 1720, but merchant vessels were subject to the depredations of enemy warships and privateers during the frequent wars of the period.

In 1664 and 1673, much of the Chesapeake tobacco fleet was destroyed by the Dutch. The Chesapeake's wide mouth, impossible to cover with guns, made it a security nightmare. The solution eventually adopted for the Chesapeake tobacco trade was the formation of an annual "convoy" of 150 to 200 ships, escorted by vessels of the Royal Navy from the Chesapeake to England. The transatlantic convoy system had actually been pioneered by Spain,

who used it to transport the year's haul of precious metals (hence the term "plate fleet"). It worked fairly well to protect the tobacco ships, but other traders were still vulnerable, as was all trade to the West Indies.

Ships and Shipbuilding

Shipbuilding emerged from modest beginnings to become one of colonial America's most important industries. Building ships was a top concern of the early colonization companies. The cod fishery, central to the early Massachusetts economy, and trade across the Atlantic, along the coast, and to the Caribbean all required vessels, which could be created locally given North America's abundance of wood.

The first vessel built in the English colonies of North America was the *Virginia*, a 50-foot pinnace built by colonists of a short-lived colony at the mouth of the Kennebec in Maine in 1607. A pinnace was usually a coasting vessel, movable under either oars or sails but capable of ocean voyaging. The colony was abandoned the next year, but the *Virginia* sailed between Virginia and London for twenty years before being wrecked on the Irish coast.

In 1622, the Virginia Company sent out Captain Thomas Barwick and twenty-five ship's carpenters to construct small vessels for coasting. Barwick died shortly after he arrived, though, and the plan came to nothing. There was a more successful effort at Plymouth, where a ship's carpenter was sent in 1624.

The leading shipbuilding colony in the early seventeenth century was New England. The New England Company sent six shipwrights to Salem in 1629 to build shallops, small undecked vessels, for fishing. John Winthrop's bark (a small decked sailing ship built for fishing and coastal trade) *Blessing of the Bay* was launched on July 4, 1631. New England was building oceangoing ships in the 1630s; the 60-ton *Rebecca* was launched from Medford in November 1633 and the 120-ton *Desire* from Marblehead in 1636. The General Court of Massachusetts exempted ship's carpenters from militia training in 1639. The development of the colonial iron industry further aided shipbuilders, although cordage and sailcloth would continue to be imported until the American Revolution.

The centers of New England shipbuilding in the late seventeenth century were Charlestown, Salem, Salisbury, Portsmouth, and particularly Boston. Boston was not advantageously situated for access to the wood and iron shipbuilders needed, but its capital and good harbor facilities enabled it to dominate the trade. Connecticut also acquired a shipbuilding industry, centered in New London. The largest merchant ship ever produced in colonial America—720 tons—was built by the New London shipwright John Jeffrey and launched in 1725.

New England shipbuilders were building not only for local needs, but for British shippers as well. They had an advantage over their English competitors both in the supply of wood and also in their design. English shipbuilders were still building dual-use ships, capable of being used as cargo ships or warships. This meant that English ships, unlike the Dutch *flyuys* or flyboats, were not designed for optimum carrying capacity. (The *Susan Constant*, leader of the Jamestown expedition, had so little capacity for carrying supplies that she had been obliged to stop in the West Indies for food and water on the way to North America.) New England ships were pure cargo ships, capacious in comparison.

New England shipbuilding was further stimulated by the need to replace the considerable English losses in the War of the League of Augsburg (King William's War) and the War of the Spanish Succession (Queen Anne's War). Other foreign markets for American ships included the French and Spanish West Indies, as well as Spain and Portugal. So successful was the New England shipbuilding industry that some English mercantilists worried that it would drain wealth from the mother country.

The second major shipbuilding center to emerge was Philadelphia; William Penn encouraged shipwrights to settle in his new colony. The late seventeenth century saw a boom in Philadelphia shipbuilding, which completely dominated the industry in Pennsylvania and the Delaware Valley. By the early eighteenth century, Philadelphia was second only to Boston as a builder of ships.

The types of ships Americans built were also changing. The pinnace disappeared in the late seventeenth century, to be replaced by the sloop. The sloop, a single-mast vessel of Dutch origin, came in two main forms: small vessels between 20 and 40 tons that specialized in coastal trade and West India traders of 50 tons or more. Unlike the pinnace, the sloop was a pure sailing vessel.

By the early eighteenth century, Boston was by far the leading harbor in the British Empire outside England, with a 1,600-foot wharf constructed between 1710 and 1713. (A 2,000-foot wharf was later built at Newport.) New York, with a merchant fleet composed mainly of sloops, was a distant second. Although shipbuilding, along with the rest of the economy, slumped after Queen Anne's War, the American shipbuilding industry was still a formidable competitor to that of Britain. In 1724, the master shipwrights of the Thames, the center of British shipbuilding, petitioned the Board of Trade to restrict American shipbuilding, claiming that the emigration of British shipwrights to the Americas would threaten the home industry. The board refused to intervene. By 1730, one-sixth of the British merchant fleet was built in the colonies; on the eve of the American Revolution, about one-third of British-registered tonnage was built in America, and ships ranked fifth in value among exports from the thirteen colonies.

The mid-eighteenth century saw new shipbuilding centers emerge outside New England and Philadelphia and the two-masted schooner replace the sloop. The poet Ebenezer Cooke, representing the view of some Maryland leaders, had called for the establishment of a Chesapeake shipbuilding industry in his 1730 *Sot-Weed Redivivus*. Even though Chesapeake shipbuilding had been relatively modest, there was already an extensive industry, concentrated in Norfolk and Annapolis, devoted to refitting and repairing ships in harbor. Chesapeake shipbuilding took off after the late 1740s, and by the end of the colonial period Maryland and Virginia combined had replaced Philadelphia as the second largest shipbuilding center in America after Boston. Southern shipbuilders specialized in large oceangoing ships and fast sloops and schooners. Charles Town, where 17 ships were launched between 1760 and 1774, had the largest average tonnage of any American shipbuilding center, and Georgia, where shipbuilding was just starting, had the second largest.

Paradoxically, as much as town establishments loved water-borne trade, they were suspicious of the sailors who were necessary for it. Sailors epitomized the transient population, the "mobility" in the eighteenth-century sense. Sailors were a distinct group, easily recognizable by their rolling gait, weathered skin, distinctive clothing, and tattoos. The sections of towns near the docks that catered to sailors—with cheap lodgings, taverns, entertainment, and brothels—epitomized the nonrespectable. Groups of sailors on leave were perceived as a possible source of crime and riot and had a reputation for brawling and blasphemy.

These suspicions were not without a basis in fact; sailors were prominent among the riotous crowds at the opening of the American Revolution. Sea captains and British authorities were also concerned about the propensity of sailors to desert, either in pursuit of higher pay on another ship or to settle in America as farmers or workers. (This was particularly easy in the decentralized Chesapeake.)

Inland Waterways

There was much travel and transport on fresh waters, as well as on the sea. The vast majority of the early colonists lived in proximity to either the sea or a river or stream. The comparative cheapness of transporting goods over water was a boon to the domestic, as well as the export, American economy; however, personal transportation was a more complex matter. Many ordinary Americans could not afford boats and often lacked the skills to sail them.

Some colonists turned to a Native American invention that impressed many Europeans, the dugout canoe. *Canoe*, deriving from the indigenous people of Hispaniola, was the first native word adopted into European languages. A canoe could be made from the trunks of several different kinds of trees, although red cedar was widely preferred for its lightness and durability. The canoe's opening was either burned or hacked out of the wood. Another Native American device adopted by settlers was the birch bark canoe. The usefulness of bark boats was enhanced by their lightness but limited by their fragility. Canoes, both dugout and bark, were particularly indispensable for explorers and traders; since they were paddled rather than sailed, they required less specialized skill to use. The expansion of the French in the interior of America, as well as that of their rivals the Iroquois, depended on the use of canoes.

Many other types of craft were used in America's waterways. Black slaves in South Carolina used shallow boats adapted from West African designs for fishing and transportation. Ferries in the Chesapeake area included flat-bottomed boats rowed, poled, or pulled through shallow waters and small sailing ships or "package boats" for deeper waters.

No area was more shaped and dominated by water transport than the Chesapeake—a region particularly rich in rivers, stream and inlets. Early visitors were much impressed by its many waterways, some comparing the newly encountered land to the Netherlands, with the hope that it would become as wealthy. The ease of moving hogsheads of tobacco by water, a process far easier on the tobacco than land transport, was essential to the development of the Chesapeake tobacco industry. The ability to anchor ships in fresh water helped protect them from the worm (*Teredo navalis*) that attacked ships' bottoms.

Transportation in the Chesapeake depended on the ability to cross water. Therefore boating skills and boats were widely distributed among the population, particularly in the eighteenth century, and roads often served merely to link ferries. The ease of transporting goods and people from plantations directly to ships on the bay also slowed the development of urban centers in the region.

The further expansion of the colonies in the eighteenth century meant that inland water transportation assumed an even more prominent role. The last decades of colonial rule saw a concerted effort to improve internal waterways by means of canals. Americans were aware of the active canal building going on in England and saw canals as a route to economic development.

The leaders in these projects were usually urban commercial interests. Philadelphia was the most active center of canal promotion. Thomas Gilpin, a Quaker merchant and member of the American Philosophical Society, was the most vigorous promoter of a canal connecting the Delaware with the Chesapeake. Philadelphia merchants subscribed 140 pounds to surveying possible routes, while Baltimore merchants charged the Philadelphians with planning to divert trade from their city. The scheme was supplemented by another plan to connect the Susquehanna and the Schuylkill Rivers.

These proposed canals led to much activity by the American Philosophical Society, the Pennsylvania Assembly, and Philadelphia merchants. Benjamin Franklin, in London, wrote to Samuel Rhoads, a member of the assembly, suggesting that it would be better to hire an experienced English canal builder rather than letting Americans try to build it themselves. Neither canal was actually built until the early nineteenth century.

Triangle Trade

The term "Triangle Trade" describes the economic exchange between Europe, Africa, and the Americas from the beginning of the sixteenth to the end of the eighteenth century. The concept focuses on the transatlantic slave trade and includes the movement of commodities from Europe to West Africa, where European slavers exchanged the commodities for slaves. From Africa, vessels transported the slaves to the Americas to be sold. After selling the slaves, the slavers loaded their vessels with cash crops and other goods for the voyage back to Europe. It was within the Triangle Trade that the colonists of British North America created opportunities to profit and expand their economic options.

The Triangle Trade began in Europe, where European slavers outfitted their vessels with crews, commodities, and supplies. The various commodities that the slavers carried to West Africa came from Europe, the Americas, and the Far East. The slave traders needed to carry the proper commodities; if they did not, the African slave traders would not do business with them, or they would demand more in exchange for each slave.

Most of the 15 million African slaves carried to the Americas went to the West Indies or into Central and South America, with North America serving as a secondary market. Many of the slaves brought to North America first lived on West Indian sugar plantations.

When the slavers arrived in West Africa, they could sail along the coast, purchasing small lots of slaves and thus increasing their travel time. They also could sail to one of the numerous slave-trading centers, where they could purchase large numbers of slaves and shorten their voyage. In West Africa, the textiles and alcohol (including rum) manufactured in the Americas, as well as tobacco and various other goods, were combined into an assortment and then exchanged for slaves. Once full of human cargo, the vessel sailed from West Africa to the Americas. This was known as the Middle Passage, during which approximately 20 percent of the slaves died; numerous ships experienced small or large slave uprisings.

Once in the Americas, the ship typically underwent a quarantine period to avoid the introduction of disease. This gave the captain time not only to advertise the impending slave auction but also to prepare the slaves for auction by utilizing various tricks to make them appear healthier than they were. Once the slaves had been sold at auction and handed over to their new owners, the vessels were prepared for their return to Europe.

Some ships returned with only their profits and ballast, but the majority carried American commodities. Most of these cargoes, because of the mercantile ideas of the time, were cash crops. The major cash crops were tobacco and sugar, plus rum and molasses, but the ships also carried naval stores, furs, grains, rice, indigo, precious stones and metals, and other natural resources. The flow of American cash crops to Europe allowed the American colonists to purchase a wide variety of European manufactured or re-exported commodities.

While mercantilism and the Navigation Acts restricted the participation of British North America in the Triangle Trade, the colonists soon found ways to profit both within and without the system. New England merchants found that they could profit not only through the fur trade but also through the carrying trade. Some colonists reacted to the limitations of the Navigation Acts by smuggling, which proved highly profitable, and they soon became adept at it.

The American colonists sent ships throughout the Atlantic world to exchange various commodities for others. From the Middle colonies, they acquired staple crops that they carried to the West Indies, where they traded the food they brought—needed there because the plantations produced only sugar—for molasses. They then carried the molasses back to New England, where they distilled it into rum, which could be traded anywhere. In Rhode Island, merchants became directly involved in the Triangle Trade by sending vessels to West Africa to participate in the slave trade.

The Triangle Trade provides a simplified explanation not only of the transatlantic slave trade but also of the economic interaction between Europe, Africa, and the Americas. The problem with the system for the American colonists was that its design and regulation ensured that most of profits flowed back to Europe, as when the Americans traded inexpensive raw materials for expensive finished goods. While the Atlantic economy was not as simple as a triangle—actually, it was made up of numerous interconnected triangles—the Triangle Trade concept summarizes the primary pattern of seagoing commerce at the time.

Tuscarora

When they first met European settlers in Virginia and North Carolina, the Tuscarora Indians had been in the area for many years, although their Iroquoian language suggests that they may originally have moved into the region from the north. The Tuscarora were the largest single native group in North Carolina, and they occupied much of the present state.

In 1701, John Lawson, surveyor general for Carolina and the region's foremost white expert on Native Americans, placed the number of Tuscarora warriors at around 1,200, which would have indicated a total population of over 5,000. Their numbers were almost certainly higher in the sixteenth century, before they faced the ravages of European disease.

The Tuscarora established permanent settlements based on corn agriculture, hemp gathering, and the maintenance of orchards. Among many Native American groups, and the Tuscarora were no exception, agriculture was considered largely women's work. Hunting and warfare were the exclusive domain of men.

In the winter, the Tuscarora removed to hunting camps. Tuscarora political life in the colonial period appears to have been highly centralized. Because of their location between expanding white settlements and interior nations, and as a result of their looming military presence, the Tuscarora became middlemen in the flourishing Anglo-Indian trade in rum, furs, skins, and firearms.

The European settlement of North Carolina, and particularly the founding of the Swiss-German settlement at New Bern in 1709 by Baron Christophe von Graffenried, posed a new set of problems for the Tuscarora. Prior to New Bern, white, largely English settlement had occurred north of their territory in Virginia and south of their territory in South Carolina. The Tuscarora also became victims of white abuse, both by individual settlers and the overall unequal terms of trade. To make matters worse, white settlements had begun to encroach on Tuscarora land.

Native Americans allied with the traders at Carolina compounded the Tuscarora's problems by continually raiding for slaves to satisfy Carolinian and West Indian demands. By 1711, the situation had deteriorated, and the southern Tuscarora decided to attack white settlements in the conflict that came to be known as the Tuscarora War.

The Tuscarora War was the defining event of the tribe's history in the colonial period. The Tuscarora succeeded in terrorizing the English and Germans of North Carolina, killing 130 of them in the initial attack. North Carolina, essentially paralyzed by fear—the colony already had a relatively weak military—asked Virginia and South Carolina for help. South Carolina responded by immediately sending an army of 500 Native Americans, mainly Yamasees, under the command of John Barnwell into Tuscarora country, where they burned several of the main towns, killing men and enslaving women and children.

The main Tuscarora force held out, though it was weakened significantly when Tom Blount, the accommodationist leader of the Northern Tuscarora, chose the English side in the conflict. He betrayed King Hancock, the Southern Tuscarora leader, to the English, who killed him. In 1713, South Carolina sent an army of 1,200 Native Americans under the command of James Moore to finish the job. Starving and powerless, the Tuscarora abandoned their homeland. A treaty was signed in 1715, officially ending the war.

In 1722, the first Tuscarora refugees made their way into Iroquois territory, where they were accepted by the Five Nations Iroquois, becoming the Sixth Nation. The process by which the Tuscarora made it to New York is not well known, but they continued to arrive until 1804.

In the American War for Independence, the Tuscarora and Oneida sided with the colonists, while most Native Americans remained neutral or actively supported the British cause. After the Treaty of Paris and the establishment of the United States, the new American government made no distinction between allied and enemy native nations. Some Tuscarora towns were among those burned by American forces in the aftermath of the war.

The Tuscarora rebuilt their homes, which were again destroyed by the British during the War of 1812 and once again rebuilt. The construction of a reservoir in the 1950s flooded much of their land, but their resistance to the project united Native Americans from many different tribes in the early beginnings of the Red Power movement. The Tuscarora maintained a strong cultural identity through all of the challenges they faced in the colonial period and beyond.

Tuscarora War

The Tuscarora War of 1711 to 1715 pitted the Tuscarora of North Carolina against the newly created Swiss and German settlement at New Bern. The end

result of the conflict was the demoralization and defeat of the Tuscarora, who emigrated to join the Five Nations Iroquois in 1722.

The Tuscarora had been living in North Carolina and Virginia for many years when the colonies of Virginia (1607) and South Carolina (1670) were founded. The tribe's population is estimated to have been over 5,000 in 1701. They lived in settled agricultural communities in the Tidewater region, though their hunting territory was farther inland.

As European settlers came to the region in increasing numbers, the Tuscarora became brokers of a flourishing trade in alcohol, fur, and deerskins between interior Native American nations and the English colonies on the coast. The establishment of New Bern in 1709 by Baron Christophe von Graffenried and his many followers posed a serious new threat to Tuscarora power in the region.

Like other tribes, the Tuscarora had been subjected to abuses by traders operating out of Virginia and South Carolina. They were often cheated and occasionally captured and sold into slavery, particularly by natives in league with the traders at Charles Town.

By 1711, the Tuscarora had had enough, and they struck back violently. In the initial stages of the war, the Tuscarora scored two decisive victories. They were able to capture John Lawson, surveyor general of Carolina, and the Baron von Graffenried himself. Although de Graffenried bargained for his life, Lawson quarreled with one of the Tuscarora leaders, Core Tom, and was put to death. The first swift attack took the lives of more than 100 English and German colonists and threw all of North Carolina into disarray. North Carolina, with few white settlers and a weak military, called on South Carolina and Virginia for assistance.

Virginia did nothing, citing poor finances and a recently signed treaty with some northern Tuscarora villages. South Carolina dispatched an army of thirty whites, led by John Barnwell and a multiethnic force of 500 Native Americans, consisting primarily of Yamasees. During 1712, Barnwell's army inflicted serious damage on the Tuscarora. On January 30, for instance, at a palisade called Fort Narhantes, Barnwell's men stormed a Tuscarora stronghold, killing all the men inside. Barnwell lamented that the natives fighting with him took most of the plunder and slaves, writing that "only one girl we got."

Barnwell met the Tuscarora again at Catechna, a fortified town. The situation here was more complex, and Barnwell, his forces depleted by deserters, sued for peace and the release of white prisoners. Upon his return to New Bern, he expected to be commended for his performance, but no commendation came. Barnwell did, however, profit by selling some native peoples, assembled under the pretense of peace, into slavery.

A larger force of South Carolinians, this time accompanied by around 1,000 Native Americans, including many Cherokees, arrived in North Carolina in 1713. The Tuscarora people's morale had flagged significantly when King Hancock (also known as Hencock) was enticed into negotiations with Tom Blount, the accommodationist chief of the Northern Tuscarora. Blount betrayed Hancock to the English, who promptly executed him.

James Moore's expedition destroyed any hope of the Tuscarora remaining in North Carolina. At Catechna, Moore's forces crushed the Tuscarora, killing around 600 and taking almost 400 into slavery. This ended any effective Tuscarora resistance at the same time as it opened up large areas of central North Carolina for European settlement. In fact, by the end of the colonial period, North Carolina had witnessed remarkable growth.

Though a handful of Tuscarora accepted English domination and remained in North Carolina on reservations, the majority slowly made their way north. In 1722, the first Tuscarora arrived in the north and became the Sixth Nation of the Iroquois, joining their distant linguistic cousins. By 1800, there were hardly any Tuscaroras still living in North Carolina.

The Tuscarora War, however, should not be seen as simply a race war or a contest between Euro-Americans and Native Americans for territory. Native Americans fought on both sides of the conflict for a variety of reasons. Also, the Tuscarora, though defeated, managed to maintain a distinctly Tuscarora identity.

Vermont

The first state admitted into the Union after the original thirteen colonies, Vermont was sparsely settled by whites during the colonial period. It served primarily as a natural trade route between the English colony of Massachusetts and the French colony of Quebec, and it became a zone of conflict for the two European empires and their Native American allies.

In the years immediately preceding European settlement, the Abenaki (also spelled Abnaki), an Algonquian-speaking tribe, were the original inhabitants of the area. In response to the formation of the powerful and aggressive Iroquois Confederation in the late sixteenth century, the various tribes of New England formed an Abenaki confederation as a defensive measure, with the Vermont region forming their northwestern frontier.

In 1609, French explorer Samuel de Champlain, based in Quebec, became the first European to travel the region, and the large lake that forms the northwestern boundary of the present-day state bears his name. Champlain and other French explorers also gave the state its name: Vermont, from “vert” (green) and “mont” (mountain), for the mountainous landscape thickly forested with conifers. (During the period under British colonial rule, the region was also known as the “New Hampshire grants” after London charters granting the territory to New Hampshire.)

In 1666, the French established the first permanent European settlement here, on the Isle La Motte in Lake Champlain. At the same time, Jesuit missionaries—living among the native inhabitants—helped create economic and political alliances between the French and the Abenaki. On behalf of the French and their own interests, the Abenaki continually skirmished with the English in the far south of Vermont.

In 1724, settlers from English-speaking New England and Dutch-speaking New York founded their first permanent settlements in Vermont. The English settled at Pownal in the far southwestern corner of the present-day state; the Dutch erected Fort Dummer on the Connecticut River near what is now Brattleboro in the southeast corner of the state. The establishment of these towns coincided with intensified warfare with the Abenaki, decimating the latter's ranks and forcing most of the survivors to migrate northward to Quebec, where they eventually settled, largely near the town of Saint-François-du-Lac.

By the time of the American Revolution, the English-speaking population of Vermont had grown to roughly 20,000. And many Vermont settlements were named after the Connecticut and Massachusetts towns from which most of the settlers came.

The fact of English settler domination also was confirmed politically by the 1763 Treaty of Paris, which ended the French and Indian War between France, Britain, and various Native American tribes. While English possession was confirmed by the treaty, Vermont remained disputed between the colonies of New Hampshire and New York.

The vast majority of Vermonters of the colonial period—with their roots in New England—resented New York's claims. Fiercely independent small-hold farmers, Vermonters feared the introduction of land speculators and the large estate-type farming typical of New York's Hudson River Valley. As for New Hampshire's claims, that colony was isolated from the most populated region of Vermont by the daunting Green Mountains. Thus, during the confusion of the American Revolution, Vermonters took it upon themselves to fight for their independence, not just from England but from other colonies as well.

In 1770, a local farmer and politician named Ethan Allen organized a militia, popularly known as the Green Mountain Boys, to defend the territory against outside incursions. At the beginning of the American Revolution in May 1775, the Green Mountain Boys helped capture the British fort at Ticonderoga. After a poorly organized attempt to capture Montreal, Allen himself was held prisoner by the British until 1778; however, his followers continued the fight to secure Vermont's independence.

In January 1777, delegates representing the various towns of the region met at Westminster. Citing the recently held Second Continental Congress at Philadelphia, where the thirteen colonies had declared their independence from Britain, the delegates declared Vermont an independent republic. They went on to declare the “arbitrary acts of the crown ... null and void,” which meant that Crown grants to New York and New Hampshire, giving them control over Vermont, were “totally dissolved.” And they stated that the inhabitants of the region “are at present without law or government, and may be truly said to be in a state of nature; consequently, a right remains to the people of said New Hampshire Grants to form a government best suited to secure their property, well being and happiness.”

The fierce independence of the Vermont settlers continued after the American Revolution. They maintained their nominal independence from the new United States until they could secure a guarantee that their territory would not be subsumed into New York State. When that assurance was finally made, Vermonters surrendered their claims to full sovereignty and joined the Union as the fourteenth state in 1794.

Verrazano, Giovanni da (c. 1480–c. 1528)

The Italian explorer Giovanni da Verrazano led France's first official voyage of discovery to the coast of North America and produced the first topographical description of a continuous voyage along the East Coast of the continent. In his valuable commentary on the indigenous people the voyagers encountered on that coast, Verrazano proved himself a highly educated and sophisticated observer, producing a remarkably objective and detailed account of the experience. In two more voyages, Verrazano searched for a path to Asia as an alternative to the Portuguese-dominated route around Africa, and he sailed to the Cape of Good Hope and Cape Horn before looking for a western passage in the Gulf of Mexico.

Although associated with Florence, Italy, by himself and contemporaries, it is more likely that Verrazano was born during the 1480s in Lyons, France, among the Florentine business community there. Undoubtedly, he received a gentleman's education in Florence before working as a commercial agent in the silk and spice trade in the eastern Mediterranean. He may have joined Thomas Aubert's French voyage to Newfoundland in 1508, and he saw Ferdinand Magellan in Portugal in 1517, but little more is certain.

His experience and knowledge of the difficulties in competing with the Portuguese in the Asian trade led Verrazano and his cartographer brother Girolamo to the court of King Francis I of France by 1523, where they proposed a voyage of exploration due west from the Madeira Islands. From contemporary knowledge, Verrazano was aware that he would not land immediately on the east coast of Asia, but he hoped to find passage westward through the largely unknown area between Newfoundland and Florida. Fearing Portuguese reprisals, Francis I contributed only the use of four ships, and the voyage was financed largely by Florentine businessmen in Lyons. Reduced to fifty men and a single vessel, the *Dauphine*, and detained by storms and the outbreak of the Franco-Spanish war, Verrazano sailed from France on January 1, 1524, and reached North America in late March.

Declaring that he was witness to a new land never before seen, Verrazano arrived on the coast somewhat south of Cape Fear, North Carolina, where fires on the shore indicated human occupation. Without landing, Verrazano sailed 50 leagues to the south, searching for a port. Fearing that he was approaching Spanish Florida, he returned north and landed near his initial sighting.

As portrayed in this seventeenth-century ceramic, the Italian navigator Giovanni da Verrazano, in the service of France, sailed up the east coast of North America in 1524, discovering New York and Narragansett bays. His explorations also produced a topographical map and valuable commentary on indigenous peoples. (New-York Historical Society, NewYork/Bridgeman Art Library)

Verrazano's admiring descriptions, taking up one-third of his report, give the first ethnological details of the indigenous people of southeastern North

America and indicate a potential for courteous interaction. Farther up the coast, he encountered numerous other groups, who offered food and information about local anchorages, and he carefully noted variations in physique, dress, diet, behavior, and housing. Similarly, Verrazano's report indicates a deep appreciation for the landscape; he named the Chesapeake Bay area Arcadia for its fruitfulness and beauty, and praised, in particular, sites he called Refugio (Narragansett Bay) and Angoulême (New York Bay).

After lengthy and agreeable encounters in the latter two places, the *Dauphine* sailed north along a less hospitable coast. The hostility and suspicion with which the Abenaki of Maine regarded Verrazano suggests that Native-European trade relations had already been soured by kidnappings and insufficient gifts from earlier European explorers and fishermen. Indeed, Verrazano himself had kidnapped a native boy farther south to bring back to France.

Verrazano continued with little further comment north to Newfoundland before sailing for France. On the return voyage, he calculated the extent of known exploration of the eastern coast of the Americas and suggested that this new continent might be larger than Asia.

On his return, Verrazano found his king, Francis I, distracted by war and his investors discouraged by his lack of commercial discoveries. Disappointed, Verrazano gave a copy of his brother's map of his explorations to King Henry VIII of England, who was provoked into sending a voyage in 1527.

Under arrangements made with French investors in 1526, Verrazano undertook two more voyages, poorly documented, with a more purely commercial goal of opening French trade with Asia. The first voyage, in 1526, with three ships, followed Magellan's route down South America's eastern coast but failed to round the stormy Cape Horn; the ships headed due east to the Cape of Good Hope, which, also proving impassable, forced a retreat by way of Brazil.

This 20,000-mile voyage over fifteen months was followed in 1528 by an expedition of five ships seeking a western passage through the Isthmus of Panama. On an island beach somewhere off the Gulf of Darien, Giovanni da Verrazano was killed by indigenous people, who were probably hostile due to prior Spanish raids.

In the 1860s, doubt was cast on Verrazano's achievements by a number of scholars, who questioned his reports and revived a scurrilous version of his death. This controversy was overturned within a generation, particularly with the discovery and publication in 1909 of an original copy of his lost report to Francis I, which restored Verrazano's fame. In 1964, his name was given to what was then the world's longest suspension bridge, connecting Brooklyn and Staten Island, thus honoring his achievements.

Vespucci, Amerigo (1454–1512)

Amerigo Vespucci has two continents named after him, North and South America. His contributions to the discovery and exploration of these continents have been the subject of a historical controversy that began during his lifetime and continues to the present day. Scholarly opinions of his accomplishments vary widely, from accounts that brand him a liar who never visited the Americas to narratives that rank him among the foremost navigators and explorers of his age.

Vespucci was born in Florence in 1454, the third son of a prosperous family, which boasted an ambassador, a banker, and a bishop. Vespucci's family was on good terms with the powerful Medici family, and Amerigo worked for Lorenzo di Pier Francesco de Medici's trading house. Amerigo worked twenty years in the commercial house in Florence, and, in 1491, he was transferred to Seville to work under Juanoto Berardi in the merchant banking and ship chandlery business.

The early Italian explorer Amerigo Vespucci was the first to identify the Western Hemisphere as a “new” continent rather than part of Asia. In 1507, a German mapmaker designated the region he had explored as “America.” (Brown Brothers, Sterling, Pennsylvania)

When Juanoto Berardi died in 1495, Vespucci took over the Medici operations in Seville. From this post, he outfitted Christopher Columbus's third voyage to the New World. It was around this time that Vespucci went to sea for the first time, and the merchant navigator became embroiled in controversy shortly thereafter.

In 1499, Vespucci helped to finance and accompanied Alonso de Ojeda's expedition to the Indies, but he got off the ship in Hispaniola and returned to Seville ahead of Ojeda. Once in Seville, Vespucci wrote about the voyage as if Ojeda were not even present. His account garnered him an appointment to accompany Gonçalo Coelho of Portugal in his exploration of Brazil.

In the fall of 1501, Coelho's fleet reached the coast of Brazil. In contrast to Pedro Álvares Cabral's landing of 1500, relations with the people of Brazil were tense, and in some cases hostile. The fleet did not find great mineral wealth, but it did collect wood, parrots, monkeys, and a few native Brazilians.

Vespucci wrote two accounts of Coelho's voyage—which he claimed as his own third voyage, although it was not really *his*, and was his second voyage, in any event—known as the *Lettera* and *Mundus Novus*. Both of these were published in Florence around 1505. These documents resulted in Amerigo Vespucci's name being associated with the continent of South America and ultimately led to his lasting fame.

In his writings, Vespucci made claims that were clearly exaggerated. For example, he assessed his own skills as a navigator quite positively: “Though a man without practical experience, through the teaching of the marine chart for navigation, I was more skilled than all the shipmasters of the whole world” (from Samuel Eliot Morison's account). Vespucci, again giving credit to himself, and not the captain of the voyage, goes on to describe an incredible journey. Vespucci's achievements as a navigator must be taken with a grain of salt, but his descriptions of the Guarani of Brazil rival Columbus's early accounts in terms of their attention to ethnographic detail.

If Amerigo Vespucci made most of his discoveries as an observer and not as a captain himself, why do two continents bear his name? The answer, in part, can be traced to the nature of Columbus's and Vespucci's accounts. Vespucci played up native sexuality, while Columbus left it out of his account. This, among other factors, gave Vespucci's letters a wider readership. Vespucci also emphasized the newness of the lands he visited. Columbus conceived of the islands he had come across as part of Asia and did not see or describe much of continental America.

It was geographer Martin Waldseemüller, a professor at Saint-Dié in Lorraine, who first used the name America to describe South America, and eventually it was used to represent both of the newly discovered continents. Waldseemüller's map and Vespucci's *Mundus Novus* were in wide circulation among influential men, and the name stuck. Vespucci's false claim that he had visited the American mainland in 1497, before Columbus, was thus enshrined. By the time Vespucci's claims were proven false, the term “America” was already widely used.

Amerigo Vespucci died in Seville in 1512. His writings continued to excite controversy and interest in the new discoveries long after his death.

Vikings

Five centuries before Columbus, the Vikings, a seafaring people from Northern Europe, became the first Westerners to discover and colonize North America. During their brief stay, they left no lasting influence. Their presence was largely forgotten until recent archaeological discoveries revived interest in the Viking experience in North America.

Scholars dispute the origin of the word *Viking*. In the old Scandinavian language, *vik* meant a “bay” or “inlet.” Vikings might have been so named because this word would describe where most harbored their boats. Britons called the Vikings *Norsemen*, which in old English meant “men from the north,” the direction from which the Vikings approached Britain.

Much of what is known about the Vikings comes from archaeological study, but documentary sources also exist. Epic Scandinavian stories called *sagas* reveal much about Viking culture.

The Vikings originated in Scandinavia in the area of present-day Denmark, Norway, and Sweden. Over many years, what had originally been small communities of Neolithic farmers, hunters, and fishermen evolved into Iron Age feudal kingdoms. Viking culture reached its peak between the ninth and eleventh centuries. During this period, the Vikings, who had always depended on the sea for food, owing to the short growing seasons of the cold North, became a seafaring power.

As seafarers, the Vikings excelled at shipbuilding. From thick Scandinavian forests, Viking shipwrights built stout, deep-drafted vessels known as *knorrs* to haul cargo around the seas and fjords of Scandinavia. They also built sleek “long ships.” These lengthy (60- to 90-foot), shallow-drafted, open boats had high sterns and prows carved to resemble mythical creatures, such as dragons. Along the side rails, a crew, numbering as many as ninety, would display their colorful round wooden shields. A single mast with a square sail or oar power drove the craft. The Vikings’ navigational skills were as advanced as their ships, and both enabled the Scandinavians to range throughout Europe and beyond.

The L'Anse aux Meadows archaeological site in northern Newfoundland—a Norse settlement dating to 1000 C.E. and discovered in 1960—provides conclusive evidence that the Vikings were the first Europeans to discover and colonize America. (Parks Canada/J. Steeves/H.01.11.01.26[14])

While many voyages were for trade, many others were in search of loot. During the idle months between planting and harvest, farmers and sailors became fearsome warriors, as the Vikings mounted expeditions to raid settlements and monasteries throughout the continent and in the British Isles. Their pagan religion glorified accomplishments in battle, and this, coupled with the prospect of gaining wealth, made them highly motivated, often merciless foes. Traveling ever farther seeking new places to sack, the Vikings reached as far east as Russia and as far south as Spain. The British Isles were a favorite target. Here, as elsewhere, many Vikings who came as raiders settled as colonizers.

Overpopulation and internal political dissent in Northern Europe also drove Vikings to seek new lands. Some headed west across the treacherous North Atlantic. In the late 800s c.e., Vikings colonized Iceland. Here around 930, clan leaders seeking to create a type of representative assembly established the *althingi*, which remains the world's oldest active parliamentary body.

Around 982, the son of a Norwegian exile living in Iceland named Eric the Red led a group of Vikings even farther west to colonize a large, ice-laden island earlier sighted by wayward sailors. Eric called the place Greenland so as to tempt potential settlers with visions of rich pasture.

Eric's son Leif was also an explorer. The “Saga of Eric the Red” also relates Leif Ericsson's exploits, which occurred around 1000 c.e. The saga tells that

Leif and his party, sailing farther west of Greenland, found inviting coastal lands full of lush meadows, thick forests, and streams teeming with fish. Here they wintered before returning home. The saga further relates that Tyrkir the German, a member of the party, once ventured from the settlement and discovered wild grapes growing in the forest. This earned the place the name Vinland, or “land of grapes.”

On his return, word of Leif's good fortune attracted other explorers. Around 1010, Thorfinn Karlsefni led over 150 colonists from Greenland in search of Vinland. The party passed thick forests and desolate sandy beaches before settling for the winter in a sheltered bay. The next spring, they settled near a wide river in an area farther south that had grapes. Life might have been good here but for worsening relations with the native peoples, whom the Vikings referred to as *skraelings*. For unknown reasons, these people went from being trading partners to being hostile adversaries. Greatly outnumbered, the Vikings abandoned their efforts to colonize the place.

The location of Vinland is much disputed. Various sites from New England to Labrador have been suggested, but none quite fits the descriptions of the land given in the sagas. What is not disputed, however, is that Vikings did indeed reach and colonize part of the coast of the North American continent 1,000 years ago.

In 1960, researcher Helge Ingstad discovered the remains of a Viking settlement dating from 1000 c.e. at L'Anse aux Meadows in Newfoundland, Canada. The excavated site revealed several dwellings, workshops, and an iron forge. It also established conclusively that the Vikings were the first Europeans to discover America.

Virginia

The first permanent settlement in America was Jamestown, Virginia, chartered in 1606. With this settlement—one of two company-established colonies, the other being the Plymouth Colony—its sponsors, the London Company's investors, hoped to make substantial profits while extending England's boundaries across the sea. The region making up the Virginia colony was larger than most European nations; thus, it was an important territory to conquer. As it turned out, however, Jamestown proved to be an investment disaster, although it ultimately succeeded as an English Crown colony. It also set the economic stage for much of the South.

A few days before Christmas in 1606, three small ships—the *Susan Constant*, *Godspeed*, and *Discovery*—set sail from London. The captain of the best ship was Christopher Newport, and his passengers included the famous soldier-adventurer John Smith. Other organizers included Ferdinando Gorges, a seasoned navigator, and Richard Hakluyt, at one time the historiographer of the East India Company, who was connected with the cathedral at Bristol and had sought permission from Sir Walter Raleigh to establish a Protestant settlement in the New World (although neither Gorges nor Hakluyt joined the voyage).

The ships' crews included merchants, traders, and landed gentry, individuals anxious to realize a profit but lacking in practical skills. This oversight became an important issue later on, as the group was ill prepared for the hardships it would face in the wilderness. In April 1607, the three vessels encountered a series of storms along the east coast of North America. Seeking protection, the voyagers entered the lower end of the Chesapeake Bay and soon came to the mouth of a wide river, which they named the James, after their king.

They sailed upriver to where the water was deep enough to allow them to drop anchor. Unfortunately, the location later proved to be near a marsh infested with malaria-carrying mosquitoes. But it was here that the adventurers founded Jamestown. In celebration of their safe arrival, Parson Robert Hunt nailed a board between two trees, a spot from which he read the Episcopal service every day and twice on Sunday.

In one of the colony's first political actions, Edward Wingfield was elected president; this, however, proved to be the first of many poor choices made by these settlers. Wingfield was not a practical man and could not lead effectively. When Wingfield later returned to England, the settlers elected John

Ratcliffe as leader, again a poor choice. Ratcliffe was more interested in developing his own empire than in developing the settlement.

The men did begin work on a fort approximately an acre in size. A palisade encircled the triangular fort, with its longest side facing the river. At each point of the triangle stood a small cannon. The men also built a handful of thatched houses and a small church within the fort's boundary; these buildings later proved to offer little protection against the harsh winters and rainy summers. The settlers also began clearing land for planting English wheat. They did not, however, dig wells but drank water straight from the dirty river—another problem that came back to haunt the newly established community.

Meanwhile, Captain Newport and John Smith led an expedition upriver. Passing several Algonquin villages, they met Chief Powhatan, the infamous father of young Pocahontas who later befriended John Smith and the men of Jamestown. Careful not to offend the chief or his tribe, Newport and Smith offered small gifts, including looking glasses, beads, and little bells. Smith, who became part of the governing council, was one of the few people to recognize the importance of good relations with the native peoples. He learned the local dialects and also mapped and explored the area around the Chesapeake Bay, as well as the Potomac and the Rappahannock Rivers.

While this group was gone, the fort was attacked by another band of natives. Several men were wounded, and only by retreating to the ships still anchored nearby were they able to escape. Cannon fire scared off their attackers.

In June, as the fort neared completion, Newport and his crews departed for England, leaving only the smallest ship behind along with approximately 100 men and boys. Newport's ships carried a cargo of timber, some worthless rocks the adventurers hoped contained gold, and the herb sassafras, used as a medicine for fevers.

Because the Virginia colony project began as a commercial enterprise, the governing corporation's interest in profits overruled the welfare of the people who were a part of it. Even if every colonist died, the corporation believed it could and would survive. Stockholders in the corporation admitted new members, elected officers, and wrote bylaws. In this way, the company ruled the colony much like a sovereign state. It could impose taxes, coin money, and even regulate trade. It also had a treasury and was responsible for the colonists' defense.

A 1606 map of Virginia, as described by Captain John Smith, shows the Chesapeake Bay, Potomac River, and other familiar geographic features. A vignette of the native leader Powhatan appears at the upper left. (Library of Congress, LC-USZ62-116706)

One important aspect of the charter provided that those who ventured to settle in the colony remained Englishmen. As such, they retained all the attendant rights and privileges, even though they were no longer living on British soil.

Religion

In addition to being given political power, the London Company was also assigned the job of spreading Protestantism. The colonizers were to propagate "the Christian religion to such people as yet live in darkness and miserable ignorance of the true knowledge and worship of God," in order to "bring the infidels and savages, in those parts, to human civility." Although they were not as fervent in this part of their mission as the Puritans in their quest for religious freedom, the religious intent of the Virginia founders was among their primary motivations. Church doctrine served as the foundation for law, and the church's creed became the measure of a godly man.

After a prayer "said by Mr. Bucke, the Minister, that it please God to guide and sanctifie all our proceedings," the initial order of business for the first Virginia Assembly, held in 1619, was to enact a number of laws mandating church attendance on the Sabbath, as well as tax support for the clergy and church. One law declared that "all persons whatsoever upon the Sabbath days shall frequent divine service and sermons, both forenoon and afternoon."

Even in 1624, laws were passed declaring that "there shall be in every plantation, where the people use to meete for the worship of God, a house or room sequestered for that purpose, and to be for any temporal use whatsoever" and that "whosoever shall absent himselfe from divine service any Sunday without an allowable excuse shall forfeite a pound of tobacco, and he that absenteth himselfe a month shall forfeit 10 pound of tobacco."

The Virginia colony, however, attracted many because of the opportunity it offered to start a new life. Initially, the Virginia Company hired settlers for a term of seven years, but these workers could not own land. The corporation provided tools and supplies, while profits went back to the company. This proved the least successful of all the company's enterprises, however, because it offered little incentive to the workers. After ten years, only a handful of laborers still operated under this plan. In 1614, the company implemented several reforms; one of these gave 50 acres to those who chose to work for the

company.

In addition, 100 acres of deeded land were offered for a price to those who could afford it. Investors could choose to travel to Virginia and work the land or hire other laborers to take their place. In the second scenario, the investor received not only his original allotment of land but also a second 100 acres for every laborer he could persuade to sail with him to Virginia. These holdings were subject to an annual tax or "quitrent" of 2 shillings per 100 acres.

A third kind of enterprise undertaken by the corporation was the granting of larger tracts of land in return for "meritorious" service. This reward was reserved for individuals who had worked as officers of the company or were substantial investors. Many of these estates later grew into enormous plantations.

After the first expedition returned to England, disaster struck the small settlement. The summer was unbearably hot, and the flimsy shelters did not protect the men from sudden storms. Food spoiled, and the few chickens that had survived the ocean voyage did not last long. In addition, because no cattle or sheep had been brought over, there was no butter or milk or easily obtained meat. The remaining sources of food included oysters, crabs, fish, and roasted squirrels. Before long, the men were suffering from disease, and many died.

By autumn, half of the original settlers were dead, and those who remained quarreled continuously. Governor Dale, in an effort to contain the conflict, hanged, shot, or broke men "on the wheel" as punishment for crimes. John Smith also wrote that there was "no talke, no hope, nor worke, but dig gold, wash gold, refine gold, load gold." The foolishness of the men caused Smith to impose strict order and to demand work in exchange for food. It was during this first winter that Pocahontas brought food to the starving settlers, helping them survive.

When the second expedition finally arrived, just after the New Year, it again brought more "gentlemen" and several goldsmiths, much to the horror of John Smith. Two women also arrived, "Mistresse Forest [Forrest] and Anne Buras [Burroughs], her maide." Mistress Forrest soon married John Layden in a church wedding. Their child, Jamestown's first, was born the next year. They named their daughter Virginia.

A third expedition once more brought gentlemen, a few tradesmen, some soldiers, and more women, many of whom arrived sick and exhausted. Unfortunately, many had died en route to Jamestown; fever had killed adults, as well as infants born during the voyage. Only a few sheep and goats survived the crossing, and John Smith, once again angered by the company's ignorance, wrote:

When you send again, I entreat you rather send but thirty carpenters, husbandmen, gardeners, fishermen, blacksmiths, mason, and diggers up of trees' roots, well provided, than a thousand such as we have.... Nothing is to be expected thence, but by labor.

In 1609–1610, the colony faced its third winter. Although there were now 700 inhabitants, the settlement again barely survived. After that season, known as "the starving time," the remaining population numbered only 60. Most died from disease and starvation. In 1609, John Smith, injured by exploding gunpowder, was forced to return to England. He would later make two more voyages to the New England region. Finally, in 1616, he compiled his observations in a document called the "Countrie of Massachussetts, which is the Paradise of all those parts."

Introduction of Tobacco

In spite of the bitter failure of the first years, Jamestown's fate turned around in 1613. There were several reasons for the settlement's eventual survival, the most important being the introduction of a crop that became highly successful: tobacco. Although little money could be made by raising corn or grain, tobacco, "the obnoxious weed," grew easily in the Virginia climate. With its popularity soaring in Europe, much of it having come from the Spanish West Indies, fortunes were quickly made in Virginia, as much as \$75,000 a year. Interestingly enough, King James I detested tobacco, declaring that it was "loathesome to the eye, hateful to the nose, harmful to the brain, dangerous to the lungs."

John Rolfe, one of Virginia's first settlers, is credited with discovering a method of curing tobacco that contributed to its economic success in the young colony. In no time, it became the economic backbone of Virginia. In 1616, accompanied by his Native American wife, Pocahontas, Rolfe traveled to England to pursue the commercial distribution of tobacco. His marriage to Powhatan's favorite daughter was seen as a great alliance for Virginia. Even James I received Pocahontas as "royalty." Pocahontas died before she was able to return to her homeland.

The second element that helped to ensure Virginia's survival was the influx of workers, "indentured servants" bound to serve for ten years in return for the cost of their passage to the colonies. Most of these bond servants were poor; many were abducted off the streets of English cities or lured aboard, only to discover their destiny too late. Others were deported convicts. The last group of workers was slaves, the first of which were brought by a Dutch ship in 1619. Although some Africans came as indentured servants, it was not long before they were kept as slaves. This influx of ready and cheap labor was seen as a great benefit to the large and growing tobacco plantations.

The third component that helped to stabilize Virginia also came in 1620–1621, when the London Company sent approximately 100 young women, "agreeable persons, young and incorrupt." These women were "sold with their own consent to settlers as wives at the cost of their transportation." These first women faced tremendous hardships as they carved out homes for themselves and their children. Thus, within thirty years, the first "native-born" Virginians took their place in history.

In spite of Virginia's eventual success as a colony, it was deemed a commercial disappointment by its initial investors. Facing bankruptcy, the London Company's charter was finally abolished in 1624 by James I. After that, Virginia's affairs were managed by a governor appointed by the Crown, aided by a small council also selected by the king. The Virginia House of Burgesses, America's first legislative body, still had a voice and passed laws, but these were subject to approval by either the governor or the king.

This shift became an important point of contention with the colonists, who saw themselves as independent of England's authority. They resented the British Crown's interference and intolerance, and their discontent grew as the years went by. Clearly, the seeds of a desire for self-determination had been sown when the first colonists stepped off at Jamestown.

It is interesting to note that of all those who settled and rose to the top of Virginia's social ladder, in the end, only three families "derived from English houses of historic note." Three others "derived from minor gentry." The rest descended from merchants, adventurers, entrepreneurs, indentured servants,

and slaves.

Virginia continued as one of the most important colonies and later became one of the most important states in the new union. Four of the first five presidents were from Virginia, and four other presidents were born in Virginia. Virginia also became the heart of the Southern Confederacy, its army led by Virginian Robert E. Lee.

In 1800, Virginia was the most populous state, with more than 885,000 residents; it remained so until the 1820s, when New York surpassed it. Tobacco remained its most important cash crop, and slavery became the means by which it was produced. In fact, in 1860, roughly 39 percent of Virginia's 1.2 million people were slaves. Today, Virginia is the twelfth most populous state, with about 6.2 million residents.

Virginia Company

The Virginia Company of London was granted a charter in April 1606 by King James I of England. The stated purpose of the company, composed mostly of London financiers and rural gentry, was to plant colonies along the coast of North America between the 34th and 41st degrees of latitude. Some supporters wanted to forestall colonization by English Catholics or Spain; others believed that Virginia might have deposits of gold.

The Company's mission, financed in part by lotteries, was conceived as a long-range project rather than a quick raid on the area's resources. Investors agreed not to take any dividends for the first seven years. The company also received new charters in 1609 and 1612, and it was eventually assigned a belt of territory that extended across North America to the Pacific Ocean.

The Virginia Company sent out its first colonizing expedition of three ships under the leadership of John Smith in December 1606, instructing its colonists to maintain good relations with the local natives, then dominated by chief Powhatan. The expedition, poorly prepared for the rigors of life in the New World, proved unsuccessful. Despite the public relations coup of the visit of Powhatan's daughter Pocahontas, a Christian convert, to London and the beginnings of tobacco cultivation, subsequent ventures also failed to prove economically rewarding. By the late 1610s, therefore, the company was increasingly troubled.

The Virginia Company was not merely an economic organization. It also presented its mission in religious terms, sponsoring and publishing sermons given to meetings of shareholders and emphasizing the duty of converting natives and planting Protestant Christianity in North America. (The great poet and preacher John Donne spoke before the company in 1622.) Unlike the sponsors of the early New England colonies, the Virginia Company, whose board included the archbishop of Canterbury and several bishops, was allied with the episcopal hierarchy of the Church of England. There was even an attempt to found a college at Henrico for the Christian education of Native American men.

The company also sponsored promotional literature, including John Smith's *A True Relation ... of Virginia*, pamphlets by London writers, and even ballads. The literature emphasized both Virginia's economic possibilities and God's care for the colonists. News about the struggles and disasters of the early colonists (often seen as the work of Satan) was not widely disseminated, for fear that it would discourage further colonization.

Between 1615 and 1619, the company became involved in a struggle between the court-connected London financier Sir Thomas Smythe and an aristocratic faction led by Sir Edwin Sandys (a member of the company's council since 1607), his brother the poet George Sandys, and the Earl of Southampton. Unlike Smythe, Edwin Sandys and Southampton were considered political opponents of the king. Sandys succeeded in acquiring control of the failing company in April 1619, and the Sandys faction tried to revitalize the settlement by actively recruiting thousands of colonists in England, which was then undergoing a severe economic depression. (Many of these new colonists quickly died once they had reached Virginia.)

The Sandys faction also tried to reorganize the colony on the basis of representative government. This replaced the system of almost absolute military rule by company governors, including the notoriously corrupt and tyrannical Samuel Argall, appointed governor in 1617. The new system divided power between a governor and council appointed by the company in London and "burgesses" elected from Virginia towns and plantations on a relatively wide franchise. Sir Francis Wyatt, a Sandys relation, was chosen as governor late in 1620. He was accompanied to Virginia by his close friend George Sandys

in the recently created post of treasurer of the colony, to which he had been appointed on May 2, 1621. Wyatt and Sandys had ambitious plans to establish self-sustaining agriculture and even industry in the new colony.

The Sandys leadership was handicapped by lack of business experience and limited knowledge of the situation in America. Soon after 1620, the company came under fierce attack in both Virginia—where the native attack of March 22, 1622, had resulted in the deaths of over 300 colonists—and London, where Edwin Sandys had to contend with the king's fury.

There was rampant factionalism within the company itself, largely resulting from Sandys's own mismanagement. The government was also suspicious of the colony's overly democratic political arrangements. A trial before the court of King's Bench in May 1624 resulted in the company's dissolution and the Crown's takeover of Virginia as the first English Royal Colony in the Americas (although its representative institutions were left intact). Sporadic attempts to revive the Virginia Company continued until 1640.

War

During the seventeenth and eighteenth centuries, colonial America saw protracted fighting between the great powers of Europe on the one hand and the American colonists and Native Americans on the other. European powers, namely France and Great Britain, exported their continental conflicts to America, and colonists fought to gain more land and defend themselves against Native American attacks. The struggles between France and England climaxed during the Seven Years' War, known as the French and Indian War in the colonies, when British victories largely drove the French from North America. Several years later, the British would themselves be humiliated in North America, with their defeat in the War of American Independence.

Warfare in colonial America took place against a backdrop of changes in European warfare collectively known as the "Military Revolution." This concept, articulated by two historians, Michael Roberts and Geoffrey Parker, refers to the period from 1500 to 1800, when gunpowder weapons came to dominate battlefields around the world. During that period, Europeans integrated firearms into their armed forces and developed large professional armies capable of wielding such weapons to maximum effect on the battlefield. In addition, European navies successfully adopted heavy cannon and married them to sturdy sailing ships that would allow Europeans to project their power around the globe.

Weaponry

In small arms and artillery, gunpowder weapons superseded older missile weapons such as the bow and arrow and the trebuchet. Firearms offered infantry forces a way to kill heavily armored opponents and were easier to learn to use as compared to the longbow, or the couched lance. New weapons required new tactics, and European leaders turned to the example of the ancient Romans for ways to fight that stressed linear formations and discipline. Over time, linear tactics became more effective and required greater discipline, contributing to the rise of large standing armies in Europe.

Early firearms were heavy and unreliable, and their smoothbore barrels offered little in terms of accuracy at any distance. Also, their slow rates of fire and reload meant that musketeers required the support of large numbers of pikemen—infantrymen who wielded long spears to attack or to keep cavalry at bay. These linear formations often required revision when they were employed in the woods of America, where sharpshooters could play a large role and cavalry was far more limited in scale than in Europe. Yet linear formations remained essential to warfare in colonial America; despite popular mythology, the Americans won their War for Independence not with eagle-eyed killers blasting away at the British from a distance, but with the well-trained and disciplined Continental army, organized along European lines.

Heavy cannon easily blasted through the high thin walls of medieval castles, which led to the development of a new style of fortress design known as *trace italienne*. Those new fortresses replaced the castles of the Middle Ages with low, thick, angular walls, designed to deflect incoming artillery and draw attackers into a lethal crossfire. Square and round towers were replaced by bastions, angular features designed to offer mutually supportive fire. Such new fortresses spread throughout Europe and later throughout the world, as they offered a superb means of defense when constructed with stone but still provided protection when constructed only with earth and wood. The Castillo de San Marcos in St. Augustine, Florida, is an excellent example of this kind of defensive structure.

The discovery of how to employ gunpowder weapons at sea also proved to be of great importance to Europeans. Large, sturdy ships built to survive the storms of northern waters also served as solid platforms for cannon. Broadships fired from such ships provided an enormous volume of firepower from a mobile platform able to carry a nation's power around the globe. The English in particular enjoyed great success at sea; English ships served as the "wooden walls" of their country and allowed British forces unprecedented mobility. The combination of land and sea forces offered the British tremendous operational flexibility, which they would exploit often in the Seven Years' War and the American War for Independence.

In addition to the so-called military revolution, broader changes were under way in early modern Europe that also spread to North America. The Protestant Reformation and the Catholic Counterreformation spawned a vast array of conflicts within and between European countries that would profoundly affect the course of settlement and warfare in North America. Puritans, the iron-willed Calvinists of England, originally settled in Massachusetts to create a "City upon a Hill," which was intended to serve as a model reformed society. During the first half of the seventeenth century, anti-Puritan sentiment in England helped increase the number of settlers traveling to New England, and the poor performance of the Protestant forces in the early stages of the Thirty Years' War also spurred immigration. A growing population helped make Massachusetts and, indeed, all of New England into a military power of increasing potency. In addition, Protestant pirates and privateers from England and the Netherlands preyed on the ships and settlements of the Spanish empire in Central and South America.

Eighteenth-century warfare took place in the age of the flintlock firearm, and both muskets and rifles were employed by combatants. The term "flintlock" refers to the way in which the weapons are fired: on pulling the trigger, a hammer bearing a small piece of flint strikes the steel lid of a pan containing a small amount of gunpowder, which then ignites the main charge of black powder in the barrel of the weapon, propelling a lead ball out of the barrel and toward its target.

Muskets are smoothbore weapons that can be loaded quickly and can accept a bayonet, but they have a very short range. During the eighteenth century, flintlock muskets served as the main weapon of soldiers, but small numbers of soldiers and many civilians carried rifles. Unlike smoothbore muskets, the barrels of rifles contained grooves called *rifling* that caused the ball to spin when fired, offering far better range and accuracy. Those grooves made rifles far slower to load, however, and meant that any units of riflemen would be extremely vulnerable to a swift counterattack or to troops on horseback. In addition, black powder caused rifles to foul rapidly, requiring them to be cleaned often, and rifles could not accept a bayonet without damaging the barrel of the weapon.

Categories of War

War in colonial America can be divided into two broad categories: war between Europeans and war between Europeans and indigenous opponents.

War with Native Americans

In fighting Native Americans, the English employed the same sort of brutality they had used against the Irish for centuries. Anglo-Saxons had a long heritage of brutality toward the Irish. Atrocities traditionally thought to have begun during the Elizabethan conquest can be dated back to the twelfth century as well: at Waterford in 1170 the English killed seventy prisoners and threw their bodies over a cliff; fifteen years later, Irish raiding into Meath were put to the sword, and over a hundred heads were sent back to Dublin. And Oliver Cromwell famously slaughtered the Catholic Irish garrison at Drogheda in 1649. The English often viewed their Irish opponents as inhuman savages, a common theme that runs through American attitudes toward Native Americans and African Americans and through English attitudes toward the Irish. Edmund Spenser's *View of the Present State of Ireland* provides an excellent example of the escalating anti-Irish rhetoric of the late sixteenth century. English colonists would employ similarly aggressive methods in waging war against their Native American opponents.

Native Americans generally waged war by raiding settlements and then disappearing into the forest rather than confronting the colonists in battle. Therefore the colonists sought either to bring the native warriors out to fight or to destroy their ability to do battle by burning the natives' crops, supplies, and villages—often with a high toll in civilians. Colonists confronted Native American guerrilla warfare in a simple and brutal way: by crushing their opponents' logistical apparatus, and forcing them either to fight or to starve. This attack on the means by which an opponent might wage war forms a cornerstone of the American way of fighting and has often reappeared in American wars. Sherman's march to the sea is a particularly vivid example.

This rare engraving, dating to the 1770s, is one of the first depictions of a soldier in the Continental army. The legend calls it an "accurate depiction."
(Brown Brothers, Sterling, Pennsylvania)

King Philip's War, the greatest of the wars between the colonists and the native peoples, occurred in 1675–1676, when the Wampanoag sachem Metacom formed an alliance of several tribes to attack Puritan colonies in New England. Metacom, known to the English as King Philip, enjoyed enormous early success against the colonists. Both sides waged ruthless attacks that proved extremely destructive and did not spare civilians. Eventually, English arms ground the Wampanoag and their allies down, and the war came to an end when King Philip was finally hunted down and killed by his adversaries. The Puritan victory ended the Native American threat to New England.

War Among Europeans

Conflict between Europeans and American colonists often occurred in the coastal areas of North America. During the colonial period, water served as the main route of transportation. Ships were, of course, needed to transport goods and people to and from the mother country, and they also served as the best means of transportation from one colony to another. Port cities were, therefore, of tremendous importance during wars between European powers, as was control of the seas. During the French and Indian War, Britain and France fought for several years for control of the St. Lawrence River. In the American War for Independence, ports such as Boston, Philadelphia, and New York all served as important centers for major campaigns.

The British ability to mount conjoint operations, demanding close coordination between the army and the navy, allowed them to strike with surprise and overwhelming force at a specific point, while forcing the Continental army to prepare to confront an attack along an extended coastline. British success in New York in 1776 came about because of British skill at mounting operations of this kind. Yet when the British lost control of the sea, as they did in the Chesapeake Bay in 1781, disaster resulted. When the British army headed by Lord Cornwallis retreated to Yorktown in 1781, a French fleet prevented its escape by sea. The Continental army, led by George Washington, laid siege to Yorktown and eventually forced Cornwallis to surrender.

During the seventeenth and eighteenth centuries, Britain and France waged a number of wars against each other as the British sought to organize European coalitions to oppose the growth of French power in Europe. During these years, France fielded a huge standing army and sought to expand her already vast power. All of the major wars—the Nine Years' War (1689–1697), the War of the Spanish Succession (1701–1714), the War of the Austrian Succession (1740–1748), the Seven Years' War (1756–1763, known in America as the French and Indian War), and the American War for Independence (1775–1783)—saw fighting between the two sides in North America, with fighting growing in scale and intensity as the eighteenth century progressed. French settlements in North America were largely centered in Canada, along the St. Lawrence River, while British colonies stretched along a narrow strip of land from Massachusetts to Georgia.

The Seven Years' War was the last major struggle between France and England for control of North America. Conflict first erupted in what is today western Pennsylvania, where a British column under General Edward Braddock was defeated in 1755. Much fighting also took place in upstate New York, near Lake Champlain, in the area that controlled the land approaches from New York to the St. Lawrence River. The British finally won a decisive victory at Quebec on September 13, 1759, when the small army of General James Wolfe defeated the army of the Marquis de Montcalm on the Plains of Abraham outside the city. When Montreal surrendered the following September, the British had gained effective control of North America.

That death grip on North America would be short-lived. By the mid-1770s, British policies drove many colonists into open rebellion against the Crown. In

the American War for Independence, which followed, British forces enjoyed tactical successes and performed well when in close contact with the Royal Navy. Yet the British failed to strike with the necessary vigor to win the war. Colonial forces, led by General George Washington, gradually improved over time from the undisciplined militia that confronted the British early in the war to the professional army that received the British surrender at Yorktown in 1781.

War of Jenkins' Ear

In April 1731, Spanish authorities stopped and boarded the British merchant ship *Rebecca* as it sailed near the coast of Cuba. After an inspection of the vessel's cargo and paperwork, the *Rebecca's* commander, Captain Robert Jenkins, was pronounced guilty of smuggling. As punishment, his captors sliced off one of his ears. This seemingly minor event had explosive consequences. During testimony to a committee of the House of Commons seven years later, Jenkins produced a handkerchief and carefully unfolded it to reveal his preserved ear. His punishment was condemned as barbaric and prompted howls of public outrage.

Throughout the 1720s, tensions between England and Spain had risen as the former expanded its commercial grip on the Atlantic and the latter attempted to limit foreign trade with its colonial possessions. When diplomatic overtures failed to bring about a peaceful resolution to trade issues, Great Britain, in October 1739, declared war on Spain—launching the War of Jenkins' Ear.

Just a month after the declaration of war, Admiral Edward Vernon mounted an assault on the lightly defended town of Porto Bello on the Isthmus of Panama and captured it easily in a single day. Vernon became an instant celebrity in England and the New World. Commemorative medals honoring his victory sold at brisk rates to an adoring public. Hoping to duplicate his success on a larger scale, Vernon in 1740 began planning an attack on the heavily fortified city of Cartagena. Leaders in England reinforced him with an army under the command of General Thomas Wentworth, and every American colony except Georgia and South Carolina was required to send troops to support the expedition.

The War of Jenkins' Ear in 1739 was triggered in part by an incident eight years earlier: Spanish naval authorities boarded a British merchant ship near Cuba, confiscated its cargo, and cut off the ear of Captain Robert Jenkins as punishment for smuggling. (Private Collection/Bridgeman Art Library)

When Vernon launched the offensive in early 1741, his force of 9,000 men included some 3,500 American colonials. The expedition arrived near Cartagena in March, and the disaster was officially under way. Vernon urged a rapid assault, but Wentworth counseled patience. While the two officers quarreled over tactics, disease carried death and demoralization through the ranks. When the British strike against the city finally came three weeks later, the Spanish repulsed it with heavy losses to the attackers. The British, having decided that the city could not be captured, evacuated the remnants of their force on April 17, 1741. No more than 600 of the 3,500 Americans survived the ill-fated campaign.

The other significant military operations during the War of Jenkins' Ear occurred along the disputed Florida-Georgia border. British General James Oglethorpe, leading a combined force of nearly 2,000 Georgia and South Carolina troops, launched an attack on the Spanish garrison at St. Augustine in 1740. Early successes against outlying positions gave the general hope for a quick victory, like Vernon's at Porto Bello. The initial plan called for simultaneous land and sea assaults against the St. Augustine fortifications so as to overwhelm the outnumbered defenders. When a sea attack proved not feasible, however, Oglethorpe unsuccessfully struggled to find an alternative means of capturing his target. Plagued by internal bickering and a lack of direction, the army laid half-hearted siege to the town for about a month before retreating. Oglethorpe attributed the campaign's failure to insubordination on the part of the South Carolina troops, but they placed the blame on the general's indecision and lack of vision. The resulting controversy caused ill feeling between the two provinces for decades.

Back in Georgia, Oglethorpe braced for a Spanish counterattack. He had less than 700 men at his disposal and could expect no assistance from the now embittered South Carolinians. In the summer of 1742, a Spanish invasion force numbering nearly 2,000 moved to attack Frederica, the southernmost settlement in Georgia. After a few minor yet sharp engagements in which the Spanish army received the worst of the exchanges, the Spanish commander's confidence began to waver. Sensing this hesitation, Oglethorpe fed rumors to the enemy camp that a strong reinforcing army from South Carolina was about to land behind the invaders, and that a force under Admiral Vernon was about to attack the weakened garrison at St. Augustine. Although he had a clear numerical superiority, the Spanish general became convinced that English forces outnumbered his own and ordered a panicked retreat—leaving behind supplies and artillery in his haste to escape.

In 1743, Oglethorpe again mounted an unsuccessful offensive against St. Augustine. This marked the final clash in the colonial conflict known as the War of Jenkins' Ear.

Warren, Mercy Otis (1728–1814)

A patriot woman of letters during the American Revolution and its aftermath, Mercy Otis Warren penned countless pieces of correspondence, poems, plays, essays, and a three-volume history of the American Revolution. She was among the most significant intellectuals of the Revolution, male or female.

Mercy Otis Warren and James Warren, her husband, descended from the earliest settlers of Massachusetts. She lived in Barnstable, Plymouth, and Milton, Massachusetts. The third of thirteen children, in her childhood she learned both the domestic arts and a partial college preparatory curriculum.

Warren was an adept student. Both her husband and her brother, James Otis, Jr., a Harvard graduate, encouraged her to develop her considerable intellect, and her family's wealth gave her the means to do it. Her belief in Providence and the early republican activism of her brother James inspired her to write on public issues to an extent unusual for women of the era. Her role model was Catharine Macaulay.

Warren corresponded with many of the leading lights of the Revolutionary era, including George Washington and Thomas Jefferson. Her most extensive and meaningful correspondents, however, included Elbridge Gerry, John and Abigail Adams, and Macaulay. Letters to Macaulay focused on politics and their shared opposition to Tory traditions. Her relationship with John Adams tended toward the tempestuous, and they did not communicate at all for several years after Adams savaged Warren's history of the Revolution. The Gerry-Warren correspondence displayed the republican values they shared during the Revolution, their concern with what they saw as the counterrevolution of the Federalist era, and their pleasure at what they saw as the restoration of republican values under the Jeffersonians. Warren's writings to Abigail Adams ranged widely from discussions of childhood education to the work of Molière.

Warren was perhaps the first American woman to write plays. She focused on political themes and was most noted for a trilogy about the American Revolution. The first of these, *The Adulateur* (1772), attacked "Rapatio," who represented the prominent Tory Thomas Hutchinson, as the overseer of an evil system of political corruption. "Brutus," his opponent, championed resistance to the colonial system. In its sequel, *The Defeat* (1773), the Hutchinson character's malevolence increased. Warren urged the good men of the resistance to practice the virtue that she believed necessary for sound government. In the final play of the trilogy, *The Group* (1775), Warren satirized British efforts to undermine the chartered rights of the citizenry of Massachusetts to elect the upper house of its legislature.

Warren also wrote a large number of political, philosophical, didactic, and spiritual poems. Perhaps most notable was her first poem, "The Squabble of the Sea Nymphs" (1774). Written at the request of John Adams, it alluded to the Boston Tea Party and contrasted the perfidy of Tories with the justice of the patriot cause. Similar works followed. A common theme in her poems was the virtue of self-sacrifice. Although her poems display a keen and educated mind, Benjamin Franklin rightly judged her as "a mediocre poet at best."

From the perspective of the historian, Warren's most significant work was her three-volume *History of the Rise, Progress and Termination of the American Revolution*, which featured a florid and Manichean style that reflected its times. Warren hoped that the work would "teach philosophy by example," as Bolingbrook once said. Her political philosophy in the *History* is in the "old republican" tradition of the radical Whig, anti-Federalist, and Jeffersonian continuum.

Her history emphasized what she saw as the eternal battle between popular liberty and the dangerous power of arbitrary and unrepresentative government. Liberty alone could not sustain a republic, however. In her view, republican government was unstable and tended toward despotism. Reason and the virtue of self-sacrifice were necessary to stave off this degeneration.

When she wrote the work in the 1780s and 1790s, her hopes for the long-term prospects of the American republican system already had begun to wane. She believed that the self-sacrifice that had marked the Revolution had given way to selfishness, faction, and greed, and that the consolidation of government represented by the Federalists did not bode well for the future of liberty. Publication may have been delayed to 1805 to coincide with the reelection of an administration sympathetic to her views.

John Adams began to viciously attack the *History* in 1807, and, in 1808, Warren's husband died. She nevertheless maintained her spirits and carried on with her intellectual life until her death in 1814. That she accomplished so much, despite her considerable duties as a devoted wife and mother of five children, made her life all the more noteworthy.

Washington, George (1732–1799)

George Washington served as commander in chief of the Continental army during the American War for Independence, presided over the convention that drafted the U.S. Constitution, and was the first president of the United States of America.

Born on February 22, 1732, in Westmoreland County, Virginia, Washington grew up in the Northern Neck of Virginia. He received little in the way of formal education, particularly in comparison with contemporaries such as John Adams. Yet his youth and later military service gave him a firm practical foundation in the art of being a Virginia gentleman, which would serve him well in later life. In his youth, he worked as a surveyor, developing an interest in land speculation that would last his entire life.

Washington inadvertently ignited the French and Indian War in 1754, when, while serving as a lieutenant colonel in the Virginia militia, he and a party of militiamen attacked a band of French troops. Among those Frenchmen killed in the attack was Ensign Joseph Coulon de Villiers de Jumonville, a French diplomat, carrying a message that ordered the English to abandon the Ohio Valley. Several months later, a larger French force captured Washington and his men; they forced him to sign a paper, written in French, stating that he had assassinated the French diplomat.

A 1779 portrait by Charles Willson Peale honors General George Washington and his victory at the Battle of Princeton. He wears a blue sash, designating his rank as commander in chief of the Continental army. (Pennsylvania Academy of the Fine Arts, Philadelphia/Bridgeman Art Library)

During the 1755 campaign, Washington accompanied British General Edward Braddock's expedition against Fort Duquesne in modern-day Pennsylvania. On July 9, he was present as a force of French soldiers and their native allies ambushed and devastated Braddock's column. Washington performed well and survived the battle with his life and reputation intact. Later in the war, he commanded the Virginia Regiment as a colonel, attempting to defend the Virginia frontier. He resigned in December 1758.

Washington began his political career in July 1758, when he was elected to the Virginia House of Burgesses, in which he would serve until 1774. He married a wealthy widow, Martha Custis, in 1759. They would have no children. Two years later, after the death of his sister-in-law, he inherited Mount Vernon, his late brother Lawrence's plantation.

In the years leading up to the American Revolution, Washington devoted himself to developing his plantation and opposing Britain's measures to exert more control over her American colonies. That opposition grew stronger over the years, and in the 1770s, Washington was elected to the First and Second Continental Congresses.

Military Career

Washington appeared at the Second Continental Congress in his Virginia militia colonel's uniform, advertising his military experience to a Congress in search of a commanding general. John Adams nominated Washington as commander of the Continental army, and he accepted in June 1775. He took command of a force arrayed around Boston. This force lacked any professional training and knew little of the military arts. Nevertheless, with the arrival of heavy siege cannon from New York, Washington managed to drive the British from Boston in March 1776.

Despite the auspicious beginning of 1776, the year took a darker turn when the British moved against New York City that summer. Washington was hammered by the British at Long Island and Manhattan Island and was eventually forced to retreat to New Jersey. He divided his raw forces in the face of the enemy and was saved from total annihilation only by the lethargy of General Sir William Howe, the British commander.

December 1776 saw a rapid revival of patriot fortunes. On Christmas Day, 1776, Washington led the Continental army across the Delaware River to attack an outpost of Hessian mercenaries in British service, taking more than 900 Hessian prisoners. On January 3, 1777, Washington struck at a British army at Princeton, New Jersey, in a brilliant stroke that allowed him to hit the British and then slip away.

During the 1777 campaign, Washington tried to protect the young nation's capital of Philadelphia against attack from General Howe, but without success. From late 1777 into 1778, the Continental army wintered at Valley Forge, Pennsylvania. During that winter, Washington, with the help of Prussian drillmaster Friedrich von Steuben, worked to shape a truly professional army from his rough recruits. The two men set about training their men in precision drill, which would allow them to perform linear evolutions on the battlefield and stand fast against British regulars, enabling the Continental army to meet the British on the field of battle and beat them on their own terms. On June 28, during the 1778 campaign, Washington's newly trained troops won a

minor victory against the British rear guard at Monmouth Court House.

For the next several years, Washington defended the Hudson Highlands of New York against British attack. The Hudson served as a bridge between the Middle colonies and New England: if the British captured it, then they could sever the links between the colonies and defeat them one by one. On July 16, Washington ordered a bold night attack at Stony Point, New York, capturing a British garrison that guarded a crossing point on the Hudson River. The following year, Washington narrowly avoided disaster when he inspected the defenses of West Point, New York, and uncovered Benedict Arnold's plot to betray West Point to the British just as it threatened to come to fruition.

In 1781, Washington executed the plan that would win the war for the patriot cause. With French naval and military support, Washington cornered a British army at Yorktown, Virginia. Then his army besieged the city. With the French fleet preventing an evacuation such as the one that took place at Boston in 1776, Washington could hammer away at Yorktown, reducing it by a formal siege. The British surrendered on October 19, 1781.

For the next two years, Washington and the Continental army resided in Newburgh, New York. There, Washington took steps to prevent the destruction of the American Revolution by military coup. His force of character prevented the American Revolution from turning to a military dictator like Cromwell or Napoleon. On December 23, 1783, Washington resigned his command of the army and retired to Mount Vernon, earning the title of American Cincinnatus, after the Roman farmer called to save the Roman republic, who achieved victory and then retired to his farm.

Washington's retirement did not signal a total retreat from public life. In 1787, he served as president of the Constitutional Convention, lending it his incomparable prestige. After the ratification of the Constitution, Washington became the first president of the United States of America, chosen by unanimous vote of the electoral college.

Washington appointed the first Cabinet, with Alexander Hamilton serving as secretary of the treasury, Thomas Jefferson as secretary of state, and Henry Knox as secretary of war. He chose the site of the new national capital, in the city that would become Washington, D.C. During his two terms in office, Washington faced the difficult diplomatic problem of dealing with the French, at that time in the throes of their own violent national revolution. In 1794, Washington suppressed the so-called Whiskey Rebellion of farmers in western Pennsylvania, who opposed taxes on distilled spirits.

Once again, in 1797, Washington showed his character by leaving the presidency after serving two terms. His was a rare act in world history and one that helps to make the case for American exceptionalism: How many other countries have been blessed with a leader who could retire at the height of his powers?

In his farewell address to the nation, Washington emphasized the need to avoid the factionalism of political parties and the entanglements of international alliances. He enjoined the American people to remember that: "Tis substantially true, that virtue or morality is a necessary spring of popular government. The rule extends with more or less force to every species of free Government." Washington died at Mount Vernon on December 14, 1799.

Weaponry

The possession and use of weapons constituted an important aspect of life during the colonial period. Weapons provided the colonists with a measure of security, as well as a means of survival by hunting. As Europeans expanded their presence in the New World, they developed a deep-seated appreciation for personal ownership of these valuable tools. Weapons gave them the independence to maintain themselves and their families, free from any of the typical restrictions they had lived under in Europe.

The native peoples of the New World did have a number of truly effective and efficient weapons that were in use throughout the New World. The weapons that the first Europeans had to face ranged from the blowguns of the South American area to the atlatl, or throwing stick, used in the area now known as Mexico, and other weapons designed for closer hand-to-hand combat. The weapons of the native peoples often served a variety of purposes—from cutting and piercing to use primarily for defense and even for symbolic or ritualistic purposes.

The Spanish and Portuguese explorers encountered the blowgun, which hurls a dart, frequently tipped with poison, from a tube propelled by the lungs of the firer. The Yagua Indian of the Peruvian Amazon used these weapons. Since these natives wore grass skirts, the Spanish believed them to be female warriors, thereby naming the Amazon River for the Greek myth of Amazon women warriors.

American Indian warriors initially used bows and arrows, war clubs, tomahawks, lances, and knives during battle with their enemies. Their bow design was much shorter than the longbow used by Europeans, as the natives did not engage in the longer-distance warfare common in Europe. Arrowheads were made of flint and bone, metal only coming into use well after European contact. The native warriors were highly skilled, and it was said that an experienced warrior could fire twenty arrows in the time it took a settler to fire and reload a single-shot musket—a feat easily demonstrated by English longbowmen of the period.

The head of the tomahawk was made of stone and was usually employed in close-quarter fighting. It could be thrown as well. However, most of the literature describing a thrown weapon involved the use of a metal head, which would have been obtained through trade with the Europeans in the later days of exploration. Stone knives also were occasionally employed in a similar way to tomahawks, being secured crossways with dried animal tendons. Knives also could be thrown or used for stabbing or cutting.

Warriors also carried lances or spears of various lengths; each was tipped with a point of chipped stone or bone. Like the Europeans, these frequently would be decorated with artistic designs or feathers. The lance could be thrown and, after horses were introduced, it became a weapon similar to that used by Europeans.

There also were a number of ritual weapons, used in special ceremonies or to inspire younger warriors by their use in combat. Some of the “coup sticks” were works of carved art, decorated with basket-like weavings on the handle and colorful feathers. To “count coup” would enable the user to add to the decorations for his exploits in battle, and thereby add to his reputation as a warrior. In advanced age, the warrior could use this device in a variety of spiritual ceremonies designed to keep his memory alive or to inspire younger warriors to feats of courage.

Longbows

The weaponry of the period may be classified into two general types: weapons that were designed to throw or hurl something else, such as bows, muskets, rifles, and cannons, and weapons used more directly, such as swords, knives, and axes. There also were weapons that were some combination of both.

Since everyone had to use an axe and a knife in daily life, these tools were common. In the British and French colonies of North America, they merged into a new tool, the tomahawk, rather similar to what we call a hatchet today. The primary difference was in the design, which allowed the tomahawk to be thrown as a missile, as well as to be used as a hand axe.

The very first of the projectile weapons to appear in the New World were the crossbow and matchlock. The earliest records indicate that some distances were measured in terms of “crossbow shots,” that is, the expected distance a bolt or arrow could be hurled from the crossbow. The early explorer Álvaro Núñez Cabeza de Vaca noted that he used the metal pieces from his crossbows to manufacture nails when he and his men attempted to build boats in an effort to return from the North American mainland to Spanish outposts in Cuba in 1528. Hernando de Soto had a group of crossbowmen with him when he crossed the Mississippi, and Francisco Vázquez de Coronado and Estévan Juan Carrillo noted that when they explored the Southwest, they carried a number of crossbows as well.

A crossbow was sometimes made of horn, but was typically steel, and the bowstring was made of hemp or flax. The crossbow would be attached to a

stock, pivoting on an axle of iron or a heavy cord. The arrow, bolt, or quarrel would be placed in a groove on the top of the stock, which would be lined with brass, iron, or horn. Preparing this device to be fired was difficult because the bow would not easily bend. Another tool, frequently called a crannequin, was then developed to allow the bow to be bent back into a cocked position by use of a gear and rack. A simple windlass was also used, as was a simple lever, which was called a "goats foot," due to the appearance of the fork, which fitted over the stock. Once the bow was drawn into firing position, the bolt, arrow, or quarrel would be placed into the groove. The weapon was ready to be fired by pressing on a trigger release, which would, in turn, release the bowstring. Crossbows such as this would be expected to fire effectively and accurately up to 350 yards.

When fired, the power of the crossbow was truly incredible. In modern test firings, it has been found to be fully capable of penetrating wood planks three-quarters of an inch thick at a range of 60 yards. Such a fearsome weapon fully suited the needs of combating men in heavy armor. But for use in the colonies against Native Americans or for hunting, the power of the crossbow was ill suited because of its slow rate of fire (due to the long period of time required to reload) and its considerable weight.

By the time of the colonization of the New World, the use of longbows in Europe had begun to disappear, and there is little evidence to confirm that these were used on the American continent, although they may have been. By the middle of the sixteenth century, the crossbow had declined in use throughout Europe, as well as in the colonies. The latest reference to this weapon was in an inventory conducted by Ponce de Leon in 1596.

Organized artillery regiments and the use of carronades (light, short-barrel pieces suited for naval warfare) were introduced by the British in the early 1700s. Various artillery pieces and other ordnance are depicted in this etching of 1779. (Library of Congress, LC-USZ62-45362)

Firearms

The weapon of choice, ideally, was one that allowed the hunter or attacker to be some distance from the target. The solution to this need was the development of the smoothbore musket in the 15th century. This early projectile firearm became the most important arm of the early explorers and colonists, but a weapon such as this was also valuable to Europeans.

All early firearms were also known as smoothbores, meaning that the barrel or bore was smooth and the shot (projectile) was, typically, a lead ball. These weapons used coarse black gunpowder as a propellant and very fine-quality gunpowder as part of the ignition system. The ignition system of these weapons had a mechanical flint striking against steel (flintlock), which would throw sparks into a small pan filled with gunpowder. This would ignite the gunpowder and thereby allow a flame to enter the barrel through a small port from the pan. The gunpowder in the barrel would then be ignited and would explode, creating a large volume of gas, which would propel the ball out of the barrel. Loading these weapons was through or down the barrel; hence all were labeled as muzzleloaders.

Matchlocks were an important projectile weapon during the early 1600s. These devices worked by an action that would bring a lighted match into direct contact with the priming powder. To confuse matters, matchlocks were frequently and interchangeably named arquebuses, calivers, and muskets. Because of the confusion in terms, it is not easy to determine exactly what type or style of matchlock is referred to in early accounts. It appears that the

term "arquebus" was also applied to a wide variety of firearms, although, at a later date, the term became associated with a wheel lock, as opposed to a matchlock. In very general terms, an arquebus would be lighter than a musket and could be fired without a rest or support.

A "caliver" appears to have been the forerunner of our current term "caliber." It also denoted a firearm that was lighter than a musket and could be fired without a support or rest. The term "musket," however, has almost always meant a heavy military firearm. At first, this would have been a matchlock, which was so heavy that a forked rest was absolutely necessary to keep the barrel steady when firing. This device would frequently weigh around 20 pounds, with a barrel of about 8 to 10 gauge (that is, the diameter of the projectile). This heavy weapon would then require up to 2 ounces of powder per charge, which thereby greatly increased the total weight carried by each individual.

Around 1650, the overall weight of the musket was reduced to about 16 pounds and the caliber made standard at 10 gauge. This then meant that "musket bore" became a standard of measure. It is interesting to note that the standard musket ball was a 12 gauge, substantially smaller in diameter than the musket's caliber. Using a smaller ball would have eased loading, because the barrel would foul after several discharges, reducing the actual bore, but it also increased the musket's unreliability with regard to accuracy.

The actual operating system of the matchlocks was simplicity in itself. There was a forked holder for the match mounted on the outside of the lock, which became known as the serpentine. This was, in turn, attached on the inside of the lock to a lever (sear). This lock would then pivot in the center on the inside of the lock plate. The trigger, which looked like a crossbow trigger, was attached to the end of the lock opposite the serpentine. An upward pressure on the trigger, working through the sear, depressed the serpentine, which held the match in an arc toward the flash pan, which held the priming powder. The match would ignite the powder, which would set off the charge in the barrel by means of a small hole from the pan into the interior of the barrel. There would also be a small spring fastened to the lock that put a force on the sear, keeping the serpentine away from the pan and avoiding accidental discharges. A hinged cover on the pan could be closed when not firing. The match itself was a loosely braided cord soaked in saltpeter so that it would burn at a measured rate, which was about 4 to 5 inches an hour.

Simple though this action was, the challenge of loading this device was indeed daunting. Such a long and difficult task, which was also somewhat hazardous, could be made worse by misfirings, or discharging without intent to fire.

A Virginia sentinel in 1611 would be required to

shoulder his piece, both ends of his match being alight, and his piece charged, and primed, and bullets in his mouth, there to stand with a careful and waking eye, until such time as his Corporal shall relive him.

As with any other necessary device or tool, matchlocks would undergo a long series of changes and alterations, finally developing many of the features of the later flintlock firearms. Some of the earliest examples of matchlocks came to the New World with the very first expeditions, and in these accounts they are usually referred to as arquebuses.

The word "musket" did not appear until the 1540 account of the Coronado expedition. But by the year 1578, muskets clearly were in use in Spanish Florida. For a period of about 150 years, the matchlock saw service throughout the colonies, but it was not the principal projectile weapon for about half of that time. By the last quarter of the seventeenth century, its use had effectively disappeared in the colonial areas.

There are several important reasons for the matchlock's decline. It was slow, it was very heavy, it required the user to carry additional weight in powder, and it was inaccurate. Another disadvantage was the lighted match, which could cause an accidental discharge or could even ignite the additional powder being carried by the shooter. This occurred to Captain John Smith in 1609, when a lighted match set off loose powder in his pocket and caused severe burns.

Although flame and this weapon should not ever be in close proximity, it was absolutely necessary to have a ready nearby source of fire to relight the match, should it go out. In addition, it was extremely difficult to keep the match burning on wet or very windy days. Usually, such weather conditions would render the matchlock totally useless, except as an awkward club. The final major drawback was that, during the hours of darkness, a lighted match could literally be a "dead" giveaway to any observant opponent. The only real advantage, in fact, of the matchlock was that when its shot hit its target, the damage would be awesome.

Around 1520, a much safer and reliable system of ignition, known as the wheel lock, was developed. Only fifty years later, the snaphaunce (an early flintlock, *snaphaunce* is a Dutch term meaning "snapping cock") was created, and, after 1600, other primitive flintlocks began to appear. But it was not until about 1720 that the wheel lock really started to replace the matchlock in the colonies.

The wheel lock operated essentially like a modern cigarette lighter: a spark is created by having a wheel spin against a piece of pyrite (flint). This simplicity in firing was duplicated in the loading and firing. To load, a wheel is wound against a spring. Then, a charge is loaded into the barrel (as in any muzzle loader), the pan is filled with priming powder, and the frizzen, or hammer, is closed. The weapon is now ready to fire by pulling the trigger. When the trigger is pulled, the spring action begins turning the wheel, and a shower of sparks is produced, igniting the priming powder.

Since early accounts seldom provided specific information as to exactly which type of weapon ignition system was being used, we cannot be certain whether a wheel lock or matchlock was in use. To further complicate matters, the term "firelock" was applied equally to both of these weapons, as well as to the musket that replaced them, the flintlock.

The move from matchlock to flintlock was generally similar in all the colonies. By 1624 or 1625, the matchlock was definitely a tool of the past. A census of that period indicated that out of a total of 1,089 firearms, only 47 matchlocks were found. When Thomas Matthew described Bacon's Rebellion of 1676, he noted that his men had flintlocks, since matchlocks were no longer used in the Virginia colony.

In 1673, the Massachusetts General Court ordered its agent, Hezekiah Usher, to purchase 500 "new snaphances or fire lock muskets" in England for its use. Then, in 1677, the Plymouth General Court outlawed the matchlock as an unacceptable weapon. The colony of New Haven determined that only flintlock firearms were acceptable as public arms in 1649. New Haven then enacted a law in 1664–1665, recognizing that only flintlock arms were serviceable weapons. Such actions caused rapid conversions from match- to flint-ignition systems.

There are at least six types of flint-ignition firearms: the snaphaunce, English lock, dog lock, Scandinavian snaplock, miquelot lock, and standard flintlock. Although all of these weapons were used in the various colonies, it is the flintlock, which began reaching the colonies in large numbers by 1660, that is of primary interest.

For over 200 years, the flintlock was the dominant type of firearm; as a result, there were a number of rather minor variations in design and manufacture. To be able to determine the exact type of flintlock under consideration requires real familiarity and the handling of many actual specimens.

The development of the various types of wheel locks and flintlocks aided in the development of several additional types of firearms. These included such weapons as the long fowler, fusil, musketoon, petronel, carbine, blunderbuss, and pistol. Of these, the pistol first appeared sometime after 1520; it was a wheel lock dag, that is, a long, heavy device with straight grips, which was rather popular with sixteenth-century cavalry. This design was also used with flintlock pistols until sometime after the beginning of the seventeenth century, when curved grips came into being.

One of the earliest reports of pistols in the colonies comes from Ralph Lane's report concerning the English colony on Roanoke Island in 1586. The number of references then increases rather quickly, starting with Captain John Smith. He used some form of a French snaphaunce pistol in the well-documented fight with Native Americans in 1607 that resulted in his capture by Powhatan and later meeting Pocahontas.

By 1611 in Virginia, all targeteers, or those who adjusted guns for targeting practice, were required to have either wheel lock or flint pistols, along with their swords and targets. The military census of Virginia in 1624–1625 revealed that there were fifty-five pistols of various types in that colony. In Pilgrim Hall at Plymouth, there is an example of an early dog lock pistol that belonged to John Thompson, who settled there in 1622.

The carbine was a rather popular weapon in seventeenth-century English colonies. As it was shorter and lighter, it was widely used by both infantry and cavalry, as well as by civilian hunters. In order of popularity, it was second only to the musket itself. The listing of "public arms" in Maryland in 1678 shows a total of 177 carbines and 613 muskets.

Of all the early types of firearms, perhaps the most interesting is the blunderbuss. By the seventeenth century, the blunderbuss, an effective short-barreled gun of large caliber, was almost always a flintlock. This weapon was designed to spray projectiles at very close range, much like a shotgun today. This device has been popularized to such an extent that some believe that it was a widely used firearm in the English colonies, but it was seldom used before the eighteenth century. In the 1678 military inventory of Maryland, out of 791 arms listed, there is only one blunderbuss.

Another interesting firearm was the long fowler. Used exactly as the name implies, it was an important hunting gun, as well as a weapon. The extended length and rather heavy breech provided for an extensive range, but that same length meant that the long fowler was very unwieldy. There are several early references to these firearms since the Massachusetts Bay Colony settlers carried with them (in their own words), "6 long fflowlinge peeces wth musket boare, 6 foote long ½" and "6 longe fflowling peeces wth musket boare 5–½ foote longe."

Edward Winslow of Plymouth recommended to those considering relocation to his colony, "Bring every man a musket or fowling piece. Let your piece be long in the barrel." Some of these firearms were as long as 7½ feet in length, which meant that they had to be fired from a stand with supports. Most fowling pieces appeared in the Hudson Valley of New York, where their use would be natural because of the annual migration patterns of ducks and geese in that area.

To summarize, all the colonies used matchlock firearms during the first half of the seventeenth century, rapidly changing to flintlock as they sought the best firearms available. As a result, the colonies were years ahead of Europe in accepting this new type of weapon, which better fitted the actual needs of the people using them.

Since the early colonists' weapon of choice would be one that would allow the hunter or attacker to be some distance from the target, the firearm was the obvious solution. This does not mean that firearms were the only weapons used, however; edged weapons were necessary as well.

Once the distance from the target was removed and the struggle became hand to hand, the firearms of the day were useless, except as clubs. They took too long to recharge (load) and were excessively heavy. Since the use of the bayonet, which converts a firearm into a polearm, did not come into common usage until the American Revolution, the explorers and colonists had to carry separate weapons to fill this need.

A few groups during the earliest of years, including the Spanish lancers, some targeteers, and pikemen, did not use firearms at all. But the reliance on edged weapons gradually disappeared, as they were not practical in typical woodland combat.

Swords and Knives

Of all the edged weapons available during this period, the most common was the sword. Every man, while on military duty, had to carry a sword, even when equipped with a firearm. Therefore, every warrior had to be familiar with its use.

It should not be surprising to find that in inventories of estates, there would be more swords than firearms and that more examples of this weapon would survive to today. As early as 1608, Captain John Smith was able to report that there were more swords available than men to carry them, and, in 1618, the "Committee for Smythes Hundred in Virginia" recommended that forty swords and daggers be provided for the thirty-five men soon to arrive from England.

Unfortunately for us, there was a wide range and variety of swords available, and America's forefathers used the term "swords" in such a generic way as to make it impossible to be accurate in identifying references to specific types. The early Spanish carried the dominant of the two principal types used throughout the sixteenth century: the double-edged cutting sword, which had been developed from earlier ages, and the rapier. It is difficult to distinguish references between the two until the art of fencing developed much later; it was then that the rapier came to be used for thrusting as opposed to cutting. With this change, the rapier blade changed as well, becoming longer, narrower, more rigid, and with only a rather rudimentary edge.

Determining the date of manufacture of these edged weapons is difficult, but there is a general rule that may be applied: If the hand guard is somewhat simple and the pommel is larger with a short grip, it may be an older-style sword.

During the middle of the seventeenth century, a smaller version of the sword was created in France, and, by the eighteenth century, this small sword had become popular throughout all of Europe. This was a light weapon that was practical for civilian use, since it emphasized speed and dexterity, instead of the formal and rather ponderous thrusts and parries of the rapier. Small swords were only used for thrusting, at first with a hexagonal blade, but finally, with the more familiar triangular shape, with all sides being concave. This provided the effect of having three sides or three edges to the blade and increasing strength and rigidity without adding any weight.

One of the earliest proofs of such small swords being used in the colonies is a 1564 painting of Frenchman Jacques Le Moyne engaged in combat with Native Americans in Florida. In the 1597 account of Captain Don Luis de Velasco, who was serving with Don Juan de Oñate's expedition, it was noted that he carried with him "a sword and a gilded dagger with their waist belts." One would suppose that this was a rapier, as he also took with him "one broadsword with shoulder belt."

Samuel de Champlain gives us his own drawing of his famous combat in 1609 with Native Americans; he is plainly wearing a swept-hilted sword, supported by a waist belt. Captain John Mason of Connecticut carried a 32-inch straight, double-edged blade during the Pequot War. His sword is 1¾ inches wide at the hilt and bears a badly worn inscription, recorded as "Veni Vidi Vici." Another famous surviving sword, a cup-hilted rapier, belonged to Captain Miles Standish of the Plymouth Colony.

A different type of sword, rather popular in colonial America, was of a short, single-edged design, which became popularized as a cutlass. This weapon quickly assumed a wide variety of names, including cutlash, cutlax, cuttle axe, and cutlace. As this device quickly became the standard for the foot soldier throughout the period, it became more commonly known as a "hanger." This was because it "hung" on the side of the soldier by a shoulder strap. Numerous references to this weapon may be found throughout all colonial records.

Another rather unique term for a variation of this blade was known as the falchion. This was also a short, single-edged cutting sword but with a heavier blade, often with a clipped point. Because it was not to be used for thrusting or stabbing but for cutting, no point was needed. One of the earliest references to this weapon was in a report by William Simmonds, who said that Captain John Smith carried a falchion with which he fought Paspahegh on Glass House Point in 1609. In 1644, John Winthrop described a falchion as the tool used to execute a Native American.

For the man mounted on the back of a horse, none of these swords would be satisfactory. As a result, one will find numerous references to another type of sword known as a "horseman's sword." Such swords were commonly very long, straight, double-edged, and frequently basket-hilted. The Spanish were especially fond of this design and even adapted the cup hilt into their rapiers.

Swords used during the colonial period were manufactured in cities still known today for their fine-quality steel products: Solingen and Toledo, for example, as well as Valencia and Milan. These blades would be shipped to the various colonies, where the hilts would be designed and fabricated by local artisans. Unfortunately for the master artisan sword makers of these early manufacturing centers, as their fame grew, so grew the forging of their marks and names. So blatant was this forgery that there are examples of blades bearing the marks not only of Solingen, but those of Toledo and Valencia as well.

In the colonies, swords were not the all-around type of cutting tool needed for purposes other than simple cutting or thrusting. As a result, the colony of Connecticut in 1675 directed that "Ten good and serviceable hatchets be provided in each county for the use of the army, and ten soldiers to carry them instead of swords." Those carrying hatchets would become known as "pioneers," cutting the way for the rest of the force following them. Due to the flexibility of the hatchet, it quickly grew in popularity, and the colonists began to abandon their heavier, more awkward swords for this lighter and more adaptable tool. Economics also played a major role, since a sword, imported from Europe, would be a very costly alternative to a device more easily manufactured nearby. The hatchet also had the advantage of dual purpose, since it had numerous domestic applications. Because many colonists were required to furnish and provide their own weapons when they served in the militia, the versatile hatchet found its place in history.

To complement the weapon arrangement of the day, the constant companion of the sword and hatchet was the dagger. Colonial references to daggers abound. Miles Standish and his force totally depended upon the use of daggers when they eliminated troublemakers in a locked room in Wessagusset. Velasco noted his "gilded dagger" on the 1597 expedition, and forty daggers were requested to be a part of the arms order for thirty-five men to be sent to Smythes Hundred in 1678.

Because of the number of rapiers throughout the colonies, it may be assumed that there would have been at least an even number of daggers as well. The two worked together because of the European development of a special style of fencing involving the use of both. When employed in this fashion, the dagger became known as the left-hand dagger, as this was the hand holding it.

The left-hand dagger developed into two types: the poignard and the main gauche. The poignard was also known as a quillon dagger, due to the style of its cross-guard. This cross-guard was of a simple style, usually with curved quillons, pointing back toward the point. Daggers with straight quillons and with wider, more triangular knuckle bows became known as main gauche daggers.

Polearms

The sword, dagger, and hatchet were joined by still another type of edged weapon that saw widespread service throughout the colonies. This weapon was the polearm. Unlike their references to other devices previously discussed, the early colonists were very specific when mentioning these weapons.

The polearms utilized in the colonies were the lance, halberd, partizan, bill, pike, and half-pike. A lance was the primary offensive weapon of the mounted soldier, and it was a special spear designed to be used from horseback. A lance would usually be 10 to 14 feet in length with a steel, leaf-shaped head attached to the shaft by either a socket or a tang driven into the wooden shaft. The shaft would ideally swell to its widest point just before the grip. On occasion, just before the grip, a metal shield, known as a vamplate, would be added to protect the hand. The Spanish introduced the lance into their colonies, and it remained popular there until about 1600, but its use never truly developed in any of the other colonial areas.

A typical weapon noted in almost all colonial records was the halberd, which was a polearm with an axe head balanced with a beak or fluke and topped

off with a spear point. The butt end of the pole would be typically enclosed with an iron or brass cap, known as the ground iron, butt cap, or foot. Used on occasion as a combat weapon, the halberd was typically carried by noncommissioned officers as a symbol of their rank, or as a ceremonial arm. In the Jacques Le Moyne painting of Native Americans in Florida during 1564, a halberd with a concave blade is present. The 1578 inventories of the Spanish forts in Florida also recorded the presence of halberds.

Strachey's Martiall Lawes of 1611 for Virginia indicates that sergeants had to carry halberds when in garrison, but that they should be abandoned for firearms when in the field. The records of the Pequot War (1637–1638) indicate that halberds were actually used in combat, and the settlers of Massachusetts Bay Colony purchased three halberds for their sergeants. In the report of expenses for the costs of King Philip's War, "Pole axes" are noted. And, in 1689, Governor Leisler of New York threatened to run one of the councilors through with a halberd.

The partizan, about 6 or 7 feet in length with the head at one point and one or more branches at the base, was typically a weapon used by officers. Basically, this would describe any short spear used by an officer during the colonial period. In 1628, colonists preparing for the trip to found the Massachusetts Bay Colony purchased "2 partizans, for capten & lieftenant (sic)."

Another type of polearm was the bill, or, as it was sometimes called, the brown bill, due to the browned finish of its blade. It had evolved from the farming tool of the same name. The bill had a hook-shaped blade with a cutting edge on the concave side along with a variety of spikes and projections on the opposite side. Bills were rather common in England, but there is only one report of them in the colonies. The Virginia Company petitioned the King for arms from the Tower of London after the Massacre of 1622. Among the arms requested and received were 1,000 brown bills, of which 50 were diverted to Bermuda, the remaining 950 finding their way to Jamestown in 1623.

The most popular of all polearms in the colonies was the pike. The full pike and half pike are identical except for their respective lengths. A typical full pike would have a shaft ranging from 14 to 16 feet, and the corresponding half pike would be half that. The preferred wood for the shaft was ash, and the head would be either leaf or diamond shaped. There was some variation in the design of the head, but this was not typical. There would also be long, slender metal straps known as langets, which would be tied to the head end of the shaft to prevent the head from being cut off by an axe or sword. Since the opposite end of the pike was designed to be braced in the ground, it was a common practice for that end to be pointed as well. Frequently, a pointed metal cup would be fitted there to add in the bracing.

Almost every colony has left us records of pikes, beginning as early as the report of Alvaro Flores in 1578 on the status of Spanish forts. Captain John Smith reported in 1609 that the colony at Jamestown had more pikes and swords than men to use them. The Massachusetts Bay Colony brought sixty pikes and twenty half pikes with them, almost as many as the muskets they carried. Plymouth Colony required that every town provide one half pike for every four men. The colony of New Netherland, differing from the other colonies, often noted the half pike (but not the full pike), since that was its weapon of choice from 1633 to 1673.

The heavy dependence upon the pike would be a normal extension of European tactics, since the use of pikemen was the bulk of all infantry forces during the sixteenth and the beginning of the seventeenth century. But in the New World colonies, different tactics were required. As the pike was found to be ineffectual against the Native Americans, their use was soon abandoned. In 1675, the General Court of the Massachusetts Bay Colony determined that

Whereas it is found by experience that troopers & pikemen are of little use in the present war wth the Indians ... all pikemen are hereby required ... to furnish themselves wth fire armes (sic).

Connecticut, however, continued to use pikes until the end of the period, and pikes remained in use solely for ceremonial purposes for many years.

The development of weapons in Europe and the colonies began to diverge as demand met the very real needs of the colonists and explorers. The sword was replaced with the hatchet or tomahawk, and the dagger changed into an all-purpose knife, instead of the rather specialized types so popular in Europe. The use of lances was only popular in the Spanish colonies, and the halberd and partisan became useful only as symbols of rank. With a few exceptions such as Connecticut, the pike was not widely used as a weapon in the colonies.

Although many weapons originally came to the colonies from Europe, the colonists were years ahead of Europeans in the development and use of firearms. This was especially true of the rifle, a new type of weapon that better fitted the actual needs of the American people.

West, Benjamin (1738–1820)

Historical painter to king of England George III and president of the Royal Academy, Benjamin West was the “most prominent artist in the English-speaking world” in his day. West was praised by continental European painters such as Jacques-Louis David, the painter of the French Revolution. In fact, David was moved to tears when West’s name was mentioned. An American neoclassical painter who made his career in England, West was the first American-born painter to attain international fame.

West was born into a family of nine children in rural Pennsylvania, near Springfield (now Swarthmore), on October 10, 1738. He was the tenth and last child of John West and Sarah Pearson. Thomas Pearson, his maternal grandfather, had been a friend of William Penn, founder of the colony. The two men had come to Pennsylvania together. West’s father has been variously described as a businessman, a cooper, a tinsmith, a hosier, and an innkeeper. Although West grew up among the Quakers, he was not a member of the Society of Friends.

Apparently West was encouraged by his family to paint at a young age. When he was ten years old, he learned how to mix colors from the local natives. His first white instructor was William Williams, a minor American artist whom West met in 1747. Williams taught him the rudiments of the palette, brushes, and colors.

In 1756, West came to the attention of the Reverend William Smith, the first provost of the College of Philadelphia, which later became the University of Pennsylvania. From Smith, he learned as much of the classics as a painter needed at this time. Although known as a history painter, West began his career by painting portraits. The portraits of the Morris children, dating from about 1752, are his earliest.

The work of Pennsylvania-born neoclassical artist Benjamin West created a sensation throughout Europe when he visited in the 1760s. He later served as “historical painter” to Britain’s King George III and became president of the Royal Academy. (Brown Brothers, Sterling, Pennsylvania)

His earliest historical painting and the only extant one from the colonial period is *The Death of Socrates* (c. 1756), which West painted at the age of 18. This painting was commissioned by inventor and gunsmith William Henry, who had read the story of Socrates’ death to West. The painting has been described as “naïve, awkward and provincial,” but it did demonstrate West’s potential.

West left America in 1760 for economic and professional reasons. He could get much better prices for his paintings in Europe, and there he could view the great works of the masters at first hand. Before leaving America, he became engaged to Elizabeth Shewell, telling her that he would not be away for

more than three years. After touring and painting in Italy for three years, however, West decided to visit England for a short time; apparently he was already contemplating not returning to America. In 1764, he had a successful showing of three paintings at the Society of Artists in London, and this triumph convinced him to remain there. West's fiancée joined him in London, where they were married in September 1764.

During his early years in London, West focused on portraits, and they provided him with a great deal of his income over the next twenty years. Many of these portraits were of Americans who visited London, including William Allen, the mayor of Philadelphia and later chief justice of Pennsylvania, and his daughter, Anne Allen.

West began painting for King George III in 1768, a patron he had for more than thirty years. Between 1768 and 1801, he completed approximately sixty paintings for the king. In 1772, George III appointed West "historical painter to the king," a position that came with an annual stipend of 1,000 pounds. West succeeded Sir Joshua Reynolds as president of the prestigious Royal Academy in 1792, a post he held except for a single year (1803) until his death.

West's most renowned paintings, all completed during his time in London, are *Agrippina Landing at Brundisium with the Ashes of Germanicus* (1768), *The Departure of Regulus from Rome* (1769), *The Death of General Wolfe* (1771), and *William Penn's Treaty with the Indians* (1772). *The Death of General Wolfe* was a controversial painting at the time, because West clothed his figures in contemporary rather than classical dress.

West died in 1820 at the age of 81. In terms of lasting legacy, West became best known as the American who painted *The Death of General Wolfe* and as a neoclassical artist who influenced many generations of American artists.

Wheatley, Phillis (c. 1754–1784)

Phillis Wheatley arrived in colonial Boston as a slave from Africa in 1761. Bought by Susannah Wheatley, the wife of a prosperous Boston tailor, "for a trifle," the young girl soon exhibited an innate intelligence that would make her the toast of the colonies and of London.

Like many slaves in the Northern colonies, she was put to work as a domestic servant. Within a year of her arrival, the little girl had learned to speak English remarkably well. Recognizing her abilities, her owners arranged for her to be educated by tutors and themselves. Soon, young Phillis Wheatley was more educated than many white children in Boston. She studied astronomy, geography, and world history, and she showed a gift for understanding and discussing complicated passages of Scripture. Early on, she was excused from doing her regular household chores, and eventually, the Wheatleys also removed her from the company of other African Americans in the household and the neighborhood.

Not surprisingly, young Phillis Wheatley was quite a conversation piece and a curiosity among colonial society. She quickly became known as a brilliant and graceful conversationalist within her master's Boston circle, and she was usually expected to accompany her owners on their social rounds. Although she might be encouraged to join in parlor conversation, she was nevertheless subjected to segregation, usually taking her meals in the host's kitchen with the servants rather than at table with the white guests.

Likely as a result of her frequent isolation from both white and black companionship, and of the free time she enjoyed because of her exemption from work, Wheatley spent much of her time reading her master's collection of books. She was particularly fond of poetry, and the English poet Alexander Pope was her favorite. Wheatley began writing poems for her own amusement, and, by the age of 13 (doubtless with her owner's assistance), she had her first work published.

Following the death of the popular evangelist, the broadside publication of her poem "On the Death of the Rev. Mr. George Whitefield, 1770" was widely reprinted throughout the colonies and in Whitefield's native England. In 1773, 19-year-old Phillis Wheatley sailed for London at the invitation of the Countess of Huntingdon, the evangelist's patron. In London, she was widely hailed as the "Sable Muse" and was the guest of honor at numerous gatherings of various poets, authors, intellectuals, and government officials. Only Susannah Wheatley's illness back in Boston, which required her favorite slave's hasty return to care for her mistress, interfered with plans for the young poet to be presented at court to King George III.

On her return voyage, the young slave woman carried copies of a volume of her poems published in London, *Poems on Various Subjects, Religious and Moral*. Underwritten by the countess, this first published work by an African American required a preface including a sworn testimony of eighteen leading Bostonians verifying that the verse was indeed the product of Phillis Wheatley's own creative genius.

The poems in this volume were generally derivative of the poetry Wheatley had read and loved. Her topics reveal an awareness of social and political events of the day, and the poems indicate the decidedly white sensibilities that formed her experience. Even the poems that address her own experiences as an African American ("On Being Brought from Africa to America," "To S. M. A Young African Painter, on Seeing His Works") are careful to reflect the prevailing notions of white supremacy of the day.

Following her owners' deaths, Phillis Wheatley was freed. She married a free African American, John Peters, and had three children, all of whom died in childhood. As a free woman, Wheatley was, for the first time, exposed to the necessity of supporting herself. Because she had been coddled by Susannah Wheatley, she found herself unaccustomed to doing the menial work that was available to her.

As her health failed and she felt the burdens of her unaccustomed work, Wheatley attempted to have a new volume of her literary works published. She advertised for subscribers to her "Poems & Letters on various subjects, dedicated to the Right Hon. Benjamin Franklin Esq.," but the proposed work did not attract sufficient interest among investors to underwrite the cost of publication.

Wheatley had only one more poem published after her *Poems on Various Subjects*—a piece she wrote and sent to General George Washington. Interest in her works and life was renewed with the advent of academic work in African American studies and women's studies in the late twentieth century.

Whitefield, George (1714–1770)

George Whitefield was born in 1714 into a family of moderate means. From early childhood, he was adept at public speaking and dramatic performances. He also demonstrated the prodigious memory and keenness of wit that marked his adulthood. By the time Whitefield entered Oxford at the age of 17, he was already proficient in Latin and Greek. It was at Oxford that Whitefield embraced religion with a passion. He joined the Holy Club, a student group led by John and Charles Wesley.

In his mid-20s, Whitefield began preaching an enthusiastic and emotionally charged brand of Christianity anywhere in England that he could gather an audience, advertising himself and his meetings by distributing flyers and handbills. His dramatic performances moved many listeners to renew their spiritual devotion; however, many conservative clergymen in the Church of England viewed the young preacher's emotional appeal with distaste and prevented him from speaking at their churches. Finding his access to Anglican churches limited, Whitefield instead turned to open-air preaching. This approach proved so successful that he soon drew crowds approaching 100,000 souls.

Whitefield soon turned his eyes toward America, where the Wesleys had gone as missionaries in 1735. Although his Oxford compatriots had mixed success in the young Georgia colony, they urged him to follow their example. Whitefield decided to see Georgia with his own eyes and to find out what role the New World might play in his future.

After a brief trip in 1738, Whitefield left England the following year for an extended stay in America. Near Savannah, he founded Bethesda Orphanage, an institution that would not only care for the material needs of parentless children but also inculcate a passion for worship. After laying the foundations of Bethesda, Whitefield spent the next two years traveling from Georgia to Maine, stopping at many points in between.

Wherever Whitefield went, people gathered to listen. Through a mixture of drama and force of will, he impressed on his listeners a desire to experience spiritual renewal. People traveled for days to hear him speak. A 1741 sermon in Boston reportedly drew a crowd of 20,000—a total greater than the city's population. Whitefield's relentless schedule led him to average more than ten gatherings per week, and his presence usually touched off waves of conversions and religious revivals in the surrounding area. His evangelical Calvinism impressed even the most skeptical listeners. According to witnesses, Whitefield's powerful voice alone—free from the histrionics that would characterize later revivals—could make people weep.

Whitefield's popularity helped fuel the print revolution in the American colonies. Newspaper publishers who reprinted his sermons were rewarded with increased circulation. Whitefield further boosted print sales by writing autobiographical pamphlets, which lacked the obscure and learned allusions that

often made similar works inaccessible to the general public.

Whitefield's ministry had its greatest impact in the Northern colonies, with their Puritan background. While his influence was not nearly so strong in Southern provinces, his message did tend to create divisions throughout the British settlements. Whitefield attacked what he saw as the complacency and excessive rationalism of the eighteenth-century Church of England. In England and America, he saw signs of a society afflicted with spiritual decay. He accused Anglican ministers of neglecting their divine mission to convert souls—both white and native—to the Lord's cause.

His criticisms of contemporary religious practice helped create a lasting split among the American clergy. "New Lights" tended to embrace religious fervor as the cornerstone of a full Christian life. "Old Lights," however, feared that the new emotionalism might degenerate into zealotry or derangement, and they strongly defended traditional elements of Anglican worship.

When Whitefield ended his first extended tour of the colonies in 1741 and departed for England, he left behind settlements rejuvenated with holy devotion. Whitefield and other itinerant ministers, such as Gilbert Tennent and James Davenport, helped to maintain a spiritual movement that would soon become known as the Great Awakening.

Whitefield carried his message to America a total of seven times in his life. It was in 1770, on the last of these journeys, that the great missionary passed from the world, having delivered 18,000 sermons that touched the lives of millions of listeners.

Widows and Widowers

Mortality rates for both men and women were high in Europe during the early modern period. Men frequently were killed while working under unsafe conditions. Women often died in childbirth. Both sexes were subject to disease and the lack of adequate or effective medical treatment.

The move to North America added further complications, especially in the Southern colonies where the climate was particularly unhealthy for European settlers. Until the 1680s, only one in three Southern marriages lasted for more than ten years without one or both partners dying. While Northern colonists had fewer climate risks, mortality rates remained high compared to modern times.

Despite the uncertainty of survival and the brevity of so many marriages, letters and journals surviving from the period indicate deep attachment between spouses. A tombstone in Essex, Massachusetts, remembers one husband's "amiable consort," an affectionate reference to a dearly loved wife. Beyond this grief, the death of a spouse had very different legal and financial implications for men and women.

English Colonies

Most married couples divided labor between them, the man responsible for the financial support of the family, the woman attending to domestic tasks and running the household. As all property and possessions belonged to the husband, the household of a man whose wife died remained intact. There was no probate inventory, no assessment of the estate. If she had been married before and had children from that marriage, her belongings would usually go to those children. (In most cases, this was decided as part of a premarital contract.) Otherwise, all property would remain in the widower's possession, whether the deceased wife had brought it into the marriage or not.

If possible, an unmarried daughter, female cousin, or sister would step into the wife's role of overseeing the domestic side of the household. Another option was to hire a housekeeper. In most cases, these were short-term solutions, since the man usually remarried.

If his new wife was previously unmarried, family life usually continued very much as it had before. If his new wife had been widowed, especially if she had minor children from her first marriage, the family became an extended one. Most families of the period had children with various combinations of parents. Children left orphaned could also be adopted into a new family.

The procedures and decisions required of a widow were far more complicated. The first task for most women was to oversee the probate of her husband's estate, assessing his property and possessions, collecting any money owed and ensuring that any debts were paid. Her role was to ensure that his wishes were carried out and his belongings legally disposed. While many men arranged for assistance in the form of trustees or overseers, placing their wives as executors of the estate was a logical choice. Only 11 percent of men dying in Maryland in the seventeenth century did not make their wives

the executors of their estates.

A wife was familiar with how the household had been run and was responsible for any minor children. Most women were also familiar with the process of probate, having seen mothers, sisters, or female friends undertake similar tasks. The job did not, however, guarantee a widow control over her husband's possessions.

The original thirteen colonies were governed by English law, derived from Anglo-Saxon tradition. According to English law, any property or possessions brought by the woman to the marriage automatically became part of her husband's estate. While some marital contracts maintained a separate, legal right to land owned by the wife before marriage, these were rare. In most cases, they were written at the request of a widow remarrying who wished to protect her children's interests.

Following the death of a male spouse, women were entitled to the "widow's dower" or "widow's third," a law passed as a means of providing for women left without financial support. This included the right to use one-third of her husband's real estate at the time of his death, regardless of how much of it she had brought to the marriage. While she could not sell the land, she could rent it out, farm it, or sell anything produced from it. If the real estate consisted of the house her husband had owned, she had the right to a portion of it, usually one or two rooms. Again, she could live there or rent the space out, but she could not sell it. She also was entitled to a third of his personal possessions, following any sales for debt.

If a man died without a will, the widow's third was automatically assigned to her. If a man wished to leave his wife more than her third, it had to be clearly identified in his will. After her death, her share usually reverted to her husband's heirs, usually the couple's children. If they did not have children, it would go to other male members of his family. If the widow remarried, her share became part of her second husband's estate, although, again, she could safeguard her own children's interests in a premarital contract.

After the estate had gone through probate, the widow was able to undertake her new life. If she was deemed the head of a household, she could now be taxed. She could enter into contracts, for herself and for her children, and she could write a will, providing for her children. While remarriage was an option, it did not necessarily happen immediately or at all.

The future circumstances of a widow's life were usually dictated by her financial status. While a poor woman was entitled to a third of her husband's estate, it was a third following the payment of any outstanding debt. If she had adult children, her best hope was that they would be able to maintain her in some way. If she had underage children, the household was usually broken up. If family or friends could not assist her, she and the children became dependent on the town and colony for support. Most communities had rules outlining eligibility for such assistance.

The future of a woman from a wealthier family also may have depended on whether or not her children were of age. If she had an adult son, it was likely that he had inherited the house she and her husband had lived in. While he was required to give her space to live in the house, she had no say in how the household was run.

If a relatively well-off widow's children were underage and it was financially possible, she could continue to run the household herself. When this happened, the family was usually from the merchant class, and the woman also took on running the family business. She would post an announcement in the local paper that she was continuing her husband's work and hope that his usual customers would return.

In 1735, Benjamin Franklin's sister-in-law Ann Franklin began running her husband's printing shop in Newport, Rhode Island. She published the *Newport Mercury*, Benjamin Franklin's almanacs, and various other documents. The wife of a Maryland blacksmith, Jane Burgess, took over her husband's shop in 1773. While such roles gave women very different responsibilities than was common at the time, the usual implication of these actions was that they were safeguarding their children's inheritances until such children were of age.

French and Spanish Colonies

The French and Spanish colonies, including Louisiana, Acadia, New Mexico, and California, followed Roman tradition for deciding law and custom. Under Roman law, a woman had separate claim to any real estate brought to the marriage. During the marriage, the husband could manage the property and spend its income, but it returned to her or her heirs following his death. A widow also was able to keep any personal property brought to the marriage such as clothing, dishes, and tools. She was able to sell or trade these items without her husband's consent or dispose of them as she wished in her own will.

While these rights were greater than those granted to English women, they did not necessarily reflect a greater interest in protecting a French or Spanish woman's ownership of personal property. Often, they were used to protect her family's personal and legal interests. Having invested in her dowry prior to her marriage, her family wanted to maintain control over this investment. These early established legal differences posed challenges as former French and Spanish colonies became part of the United States following the American Revolution.

By the early nineteenth century, medical improvements had led to a drop in mortality rates for both men and women. Most spouses could expect to raise their own children to adulthood. As a result, the concept of the family as a complete, unifying group gained in importance throughout the nineteenth century.

Wilkes, John (1725–1797)

An eighteenth-century English radical, John Wilkes's libel of King George III caused the rise of the "Wilkes and Liberty" campaign, as the radical segments of London's middle and lower class struggled to protect their freedoms from what they saw as growing political tyranny. Wilkes also became a hero to many American patriots. He was frequently toasted at banquets, and his name was mentioned in political speeches.

Wilkes was born on October 17, 1725, to a malt distiller. His marriage to a wealthy landowner, Mary Meade, in 1747 gave Wilkes the economic freedom to carouse with friends—resulting in his divorce in 1757—and later to become involved in political activities, eventually leading to his election as a member of Parliament from Aylesbury.

Coinciding with Wilkes's election was King George III's appointment of the Earl of Bute as prime minister. This upset many members of Parliament, who felt that Bute was not qualified to serve in this position. Wilkes quickly became Bute's most vehement critic; his criticism became even more vehement when, in June 1762, he created *The North Briton*, his own newspaper, to further attack George III and Bute. Wilkes was soon arrested for seditious libel, but his case was dismissed because of his status as a member of Parliament. The episode increased Wilkes's reputation as a protector of English liberties.

In the colonies, silversmith and future patriot Paul Revere celebrated Wilkes's criticism of the king and Bute by creating a punchbowl weighing 45 ounces and holding 45 gills (half-cup servings), after the issue number of *The North Briton* in which the allegedly seditious article appeared. At a banquet, other future patriots, including James Otis, Jr. and John Adams, drank 45 toasts from it. Indeed, throughout the colonies, the number 45 became symbolic of resistance to tyranny.

Back in England, Wilkes found himself in more trouble. After engaging in a duel, for which Parliament declared him not immune, Wilkes fled to France. Debts there forced his return to England in 1768, where he ran for the Middlesex parliamentary seat. He won easily, but before he could take his seat, he was arrested and transferred to the King's Bench Prison to await trial. Wilkes's arrest created protest throughout London, with the crowd most often gathering on St. George's Field near the prison. There were sympathy protests throughout the colonies as well.

A London journalist and member of Parliament, John Wilkes was a leader of political radicalism in eighteenth-century Britain. He stirred controversy with his attacks on King George III and called for reform in the 1760s. (Philip Mould, Historical Portraits Ltd., London, United Kingdom/Bridge-man Art Library)

On May 10, 1768, a well-organized crowd of 15,000 arrived at St. George's Field to await the start of Wilkes's trial. The authorities feared that the crowd might try to rescue Wilkes; therefore, the Riot Act was read, but the crowd refused to disperse. As the situation worsened, the troops opened fire and killed seven protestors, making the St. George's Field Massacre a rallying point for London radicalism.

As the mob took to the streets, Wilkes was found guilty and sentenced to twenty-two months in prison, as well as a 1,000-pound fine. The guilty verdict caused Wilkes to lose his seat in the House of Commons. He was reelected three times by the voters of Middlesex, but each time, Parliament overturned the election results. After his third reelection, Parliament appointed Colonial Henry Luttrell as the Middlesex representative.

The Middlesex supporters of Wilkes formed the Bill of Rights Society to protest his situation, while also developing a radical reform program. Through the Bill of Rights Society, Wilkes' supporters tied their cause to that of the American colonists involved in their own struggle with English tyranny.

In April 1770, Wilkes was released from prison, and, while his parliamentary ban kept him out of the House of Commons, he remained politically active. He became increasingly interested in supporting the cause of freedom of the press. When Parliament tried to prevent newspapers from publishing its proceedings, Wilkes resisted. When two of his printers were arrested for having printed the proceedings, crowds again gathered in support of Wilkes and his cause. This time, the government decided to release the two printers.

In 1774, Wilkes returned to politics, being elected lord mayor of London. He was subsequently elected to represent Middlesex in the House of Commons and continued to work to reform England's political system.

During the American Revolution, Wilkes persisted in his radicalism and pushed for reform; however, his views changed as he grew older. In the 1790 election, the Middlesex voters decided that he was no longer radical enough to suit them, and he lost the election. With this, he retired from politics. Wilkes died in December 1797.

William and Mary, College of

The College of William and Mary was the second college to be founded in North America. Its royal charter, awarded in 1693, laid out two aims: the study of divinity required to train a minister and the general education required to become a gentleman. James Blair, a Scottish cleric, was appointed president and left London with a generous endowment of 2,000 pounds, as well as 20,000 acres of land. He was also entitled to the revenue derived from taxes on tobacco and furs on these lands in order to establish his college somewhere in the royal colony of Virginia.

Blair chose Middle Plantation, a struggling settlement that, when the first college building was completed in 1698, was renamed Williamsburg. Following the destruction of the capitol in Jamestown in 1699, Blair and Governor Francis Nicholson relocated the seat of government to Williamsburg.

Although well-equipped with a royal charter, a sizable endowment, and a campus, the college lay bereft of any students or faculty and operated as little more than a grammar school for boys until 1705. A half-hearted attempt to establish an Indian school was failing, and local gentry continued to send their sons abroad to be educated. It was only in the 1720s, as the second generation was followed by the third, that Virginia's elite began to realize the benefits of local higher education.

By 1729, the college had finally secured sufficient faculty and students to allow the transfer of administrative control from the trustees to the faculty. With his authority now assured, President Blair set to work on the curriculum. After completing their courses in the Grammar School, boys entered the School of Philosophy, where they followed a curriculum heavily reliant on English and Scottish models: rhetoric, logic, and ethics were followed by advanced study in physics, metaphysics, and mathematics. Students might then proceed to the graduate School of Divinity before being confirmed as Anglican ministers.

One innovation in the undergraduate syllabus was the provision that students would not confine themselves solely to the study of classical philosophers. By the time President Blair died in 1743, the works of Locke, Newton, and other modern thinkers were also being taught to a student body that numbered around sixty annually.

This diet of natural law and natural rights clearly had a profound effect on students passing through the college in the mid-eighteenth century, and ultimately this royal endowment produced many gifted patriot-politicians. Thomas Jefferson (class of 1762), for one, looked back on his studies with Professor William Small, the pioneer of the lecture system, as the most formative period in his intellectual life. Moreover, the proximity of the colonial legislature provided a useful laboratory in which to observe and participate in political life. By the time of the Revolution, the House of Burgesses was nearly full of William and Mary men; at the Continental Congress, 16 of the 33 delegates, including the congress's president, had been educated at the college.

As the only American college to have been founded by royal charter, William and Mary benefited from a unique position in colonial politics for much of the eighteenth century. A succession of bishops of London filled the office of chancellor and used this office to bring many Anglican clergy to the college as faculty. The president of the college also served as the head of the church in Virginia, an imperial bond that tied the authority of the college to the fortunes of the Anglican church in the colony and, by extension, to the reputation of the British Crown itself.

Thus, while William and Mary had benefited academically and financially from its imperial associations, growing anti-British sentiment after midcentury quickly put the college's future in jeopardy. In 1775, two of the college's six professors fled to England, while three more left to join the Continental army. Thirty-seven students also joined the army, while many others organized militia companies. In 1777, the remaining faculty wisely appointed their patriot chaplain, the Reverend James Madison (second cousin of the future U.S. president), to the office of president, a move that surely saved the college from a sacking. Instead, the college was briefly closely and occupied by both sides, first as a hospital and then as a barracks.

The loss of its English endowment meant that the college faced dire financial circumstances after the Revolution. In 1779, President Madison took action, closing the costly Grammar and Divinity Schools and replacing them with the more lucrative preprofessional Schools of Law and Medicine, thereby creating the first university in North America. Alongside this structural reorganization came a political reorientation. The nationwide expansion of Phi Beta Kappa, a Greek letter fraternal organization that had begun among William and Mary students in 1776, was emblematic of the college's distinctive turn away from the motherland toward a future tied to Virginia and to the new United States.

William III of Orange (1650–1702) and Mary II (1662–1694)

Born at the Hague, November 4, 1650, William III of Orange was the posthumous son of William II of Orange and his wife, Mary Stuart (daughter of Charles I of England). Educated at Leyden, he was kept out of power until 1670, when the pressure of war with France caused the Dutch to accept him as their captain general and then stadholder, a position that had become hereditary to the Orange family. William quickly showed himself a skillful and dedicated soldier, who resisted invasion by both Louis XIV and his British allies.

In 1677, to seal a treaty with Charles II, William married his niece Mary, the eldest daughter of James II by his first wife Anne Hyde. Mary had been born in St. James's Palace, April 30, 1662, and had been educated as an English Protestant gentlewoman rather than a potential queen. Happy in the Netherlands, William and Mary's world changed in 1688, when the birth of James II's son, potentially a Catholic king, prompted disgruntled English politicians and nobles to invite William to come to England to take the throne.

Although the military and Parliament supported William, he was unwilling to accept the throne as a conquest, nor did he wish to rule as a prince consort by right of his wife. Instead, Parliament invested them jointly as king and queen. They responded with the Declaration of Rights, which limited the power of the monarch and served as a model for the later American Bill of Rights, and an agreement with the Scottish Parliament to allow Scotland to remain Presbyterian and retain its independent government.

With Britain's resources, William III was able to continue his wars against Louis XIV's France, which quickly spilled over into Scotland and Ireland when the French backed a force to restore James II to the throne. William III was in command of the army at the Battle of the Boyne, and he continued the campaign in the Netherlands as head of the League of Augsburg until the Treaty of Ryswick in 1697.

William III's expensive and time-consuming wars allowed much of British government to be taken up by professional politicians and required the development of infrastructure suitable to an emerging world power. In 1694, the Bank of England opened for business, giving the king a centralized financial system superior to any other in Europe. Mary II took little part in government and served uncomfortably as the sovereign when William III went overseas to fight.

Colonial possessions were of great concern to William and Mary. The Revolution of 1688 had sparked great changes in colonial government, including the breakup of the Dominion of New England and the removal of the charter for Maryland from the possession of the Catholic Calvert family. Additionally, the Crown had to put down a pro-Dutch faction in New York led by Jacob Leisler and to reissue the Massachusetts Charter to combine Plymouth and Massachusetts Bay as a single entity. The War of the League of Augsburg spilled over into North America as King William's War, in which French-backed Native Americans raided the Massachusetts frontier and Governor William Phips of Massachusetts seized Acadia.

Mary II, deeply concerned for the spiritual welfare of the colonists, advocated an American Episcopal bishop and endowed the College of William and Mary in Virginia. She died of smallpox on December 28, 1694. William III never remarried or had children.

In 1696, William III implemented the Navigation Act, which installed a bounty system for needed naval stores and staple products and allowed royal officials to issue writs of assistance as the equivalent of search warrants to trap smugglers and tax evaders. William III's government, a group of Whigs known as the Junto, engaged Captain William Kidd to track down the pirates. Kidd's own piracy later became a source of deep embarrassment to the Crown.

William III, never popular in England, died on March 8, 1702, after contracting pneumonia while recovering from a riding accident. Jacobites, supporters of James II and his descendants, often toasted the mole into whose hole the king's horse had fallen. As one of his last political acts, William III had signed into law the Act of Settlement, which passed the throne to his cousin and sister-in-law, Mary II's younger sister Anne.

Williams, Roger (c. 1602–1683)

Roger Williams's views on the separation of church and state and his fair dealings with Native Americans have ensured his place among the most forward-thinking people of his age. Williams based his life upon his religion as he understood it, and his politics and philosophy were subsumed by passionate faith. Biographers, most notably George Bancroft, tend to emphasize the aspects of his beliefs that modern readers find agreeable. But Williams's life was more complex than his legend or these writings let on.

Roger Williams was born in between 1602 and 1606 in Smithfield, England, a bustling commercial area on the northwestern side of London. From an early age, religion was the most important thing in his life. Though the precise date is unknown, Williams experienced a life-changing conversion early in life. Separatist sentiment was strong in and around Smithfield, and it is not surprising that Williams latched on to a particularly strong version of Separatist faith.

As a young man, Williams worked as a stenographer for Sir William Coke, a famous lawyer. His connection to Coke paved his way to study at Cambridge from 1624 to 1628. Following his formal education, Williams became pastor at the manor house of Otes, about ten miles outside of London. In 1629, he married Mary Barnard, and, in 1630, wary of the increasing persecution of Puritans and Separatists, the couple sailed for New England.

From 1631 to 1635, Williams worked as a farmer and pastor, all the while engendering controversy for his radical views. Williams fought relentlessly to keep religious practice pure and free from the influence of the Church of England. He questioned the right of the English king to grant land in America and the wisdom of allowing magistrates to rule on religious matters.

While he was the pastor at Salem, Williams forced a showdown with the Massachusetts Bay Colony authorities. Believing in the absolute autonomy of individual congregations, he refused to submit to directives from the colony's leaders. Williams's headstrong behavior resulted in his banishment from the Massachusetts Bay Colony in 1635. Before he could be shipped back to England, however, he struck out for the edge of the Plymouth colony, eventually arriving at the site of present-day Providence.

Providence, the settlement founded by Williams, attracted about 100 Separatists and other outcasts in its first four years of existence. Best known were Anne Hutchinson and her followers, who also moved to the area following their banishment from the Massachusetts Bay Colony. Rhode Island continued to grow, and, while not all of its residents were of the same mind as Williams, they enjoyed the colony's prime location and tolerance for diverse viewpoints.

In 1643, Williams sailed to England to secure Rhode Island's patent. There, he obtained a patent that included language separating religious and civil authority completely. It also combined Providence, Portsmouth, and Newport under one colonial government.

While in London, Williams wrote and published his most famous work, *The Bloudy Tenent of Persecution*. In this document, Williams advanced the ideas that every person and religious group was entitled to religious liberty as a fact of nature and that governments should play no role in the enforcement of religious laws. He supported his radical views with passages from the Bible.

From 1654 to 1657, Williams served as president of Rhode Island's general assembly. From this post, he was able to deal with factional problems that had plagued Rhode Island since its inception, relying on his skills as a politician.

Banished from Puritan Massachusetts, Roger Williams founded the colony of Rhode Island on the principles of religious tolerance, separation of church and state, and representative democratic government. (Brown Brothers, Sterling, Pennsylvania)

Williams was fascinated by his Narragansett neighbors, and his *Key into the Language of America*, published in 1643, has proven to be extremely useful in reconstructing the native world of Rhode Island in the seventeenth century. The book, intended to serve as a guide for converting the Narragansett to Christianity, is packed with thorough ethnographical observations. Williams was primarily interested in Narragansett culture as a means to conversion, but he also found religious significance for the English in their dealings with native peoples.

When he no longer served Rhode Island in an official capacity, Williams continued to guide the colony from behind the scenes, until deteriorating health forced his retirement from public life in the 1670s. Roger Williams died in early 1683.

Williamsburg

"The establishment of the first city government in Virginia was of primary importance in American political history." These are the words spoken by Governor John G. Pollard in 1932. Colonial Williamsburg played a significant role in the cultural, educational, and architectural history of Virginia.

The town of Williamsburg, Virginia, originally known as Middle Plantation, was founded by John Page, a planter who arrived from England in 1650. Williamsburg was named in honor of King William III. Page was a wealthy and powerful Virginian who convinced Virginia officials to move the capital from Jamestown to Williamsburg after a fire destroyed Jamestown.

The city of Williamsburg, Virginia (pictured around 1740), was founded as Middle Plantation in 1633 and became the permanent capital of the colony in 1699. It remained the political and cultural center of Virginia for the next 80 years. (Library of Congress, LC-USZ62-2104)

Page devoted his life to the promotion of Williamsburg. He donated the land for the most important church in the town, Bruton Parish Church, and he helped to establish the College of William and Mary. Page would serve in several important capacities in Virginia's colonial government: colony officer, high sheriff, and member of the Governor's Council, the upper house.

Williamsburg was created by an act of the General Assembly in 1699. Francis Nicholson, the governor at the time, and his executive council appointed a governing board of directors composed primarily of land-owning gentlemen. These officials were appointed rather than elected during the first 170 years of the town's history.

Governor Nicholson designed the town. He is responsible for making a boulevard out of Duke of Gloucester Street and for the "capitol," in which the House of Burgesses met. In addition, between 1699 and 1722, most of the historic and stately buildings of Williamsburg were built: the first capitol, the courthouse, the theater (1716–1717, the first in America), and, in 1720, the Governor's Residence.

In 1722, King George I granted Williamsburg a royal charter incorporating the town. Williamsburg would now have a local government composed of a mayor, a recorder, six aldermen, and a twelve-member council known as "Common Hall." It was an unelected government and could send one representative to the House of Burgesses.

Colonial Virginia had a population of 23,000 by 1750, or about one-fifth of the entire colonial population. Approximately 3,000 of these inhabitants lived in Williamsburg, a town made up of some 300 homes. Slaves, mostly household servants, made up about half of the town's population. The town occupied an area of about a square mile; its population increased to about 4,000 with the political season, when the lower house, the House of Burgesses, was in session. The British influence, personified by the governor, was evident in the style and fashion favored by the townspeople. Williamsburg had an air of sophistication and a refinement not found elsewhere in the colonies.

The College of William and Mary, the second college to be founded in America, was an important and integral part of colonial life in Williamsburg. (Harvard College, the first, was founded in 1636.) In September 1693, the Virginia Assembly decided to create an educational institution that would educate the state's elite males, who would serve the town as doctors, lawyers, or ministers. In February 1693, therefore, the colonial legislature asked Reverend James Blair to petition King William III and Queen Mary II for a charter for the college. Blair traveled to England and returned with the charter. During the first thirty-five years of its existence, the college operated as "grammar school" for Williamsburg's elite, educating boys from ages 12 to 15.

The College also had a school of divinity, a school of philosophy, and an Indian school. The Indian school educated and "Christianized" Native American boys. The college rarely had more than sixty students and was primarily a training institution for Anglican ministers. British-born Anglican ministers controlled the college and transmitted their values of loyalty to the mother country to the town. The college was unapologetically loyalist, and college and town politics were intrinsically connected.

In 1779, the Reverend James Madison, a cousin of the founding father by the same name, became president of the college. His goal was to reorganize the college by eliminating the grammar school and instruction in divinity. Thomas Jefferson is one of the college's most famous graduates. He arrived at William and Mary in 1760 at the age of 16 and enrolled in the School of Philosophy, where he remained for two years before embarking on the study of law.

During the years preceding the Revolution, Williamsburg was one of the most significant political centers in the colonies. In 1765, from the state capitol, legislator and patriot Patrick Henry delivered his famous speech against the Stamp Act in which he spoke the famous words "Give me liberty or give me death." This pronouncement resulted in the resignation of the local stamp agent. Both British and French forces spent time in Williamsburg during the war.

In 1780, the capital of Virginia was moved to Richmond, and Williamsburg became a small college town. Between 1927 and 1935, under the sponsorship of John D. Rockefeller, the town of Williamsburg was restored to resemble its colonial state and is today a popular living history museum.

Winslow, Josiah (1629–1680)

Born in 1629 to Edward Winslow and his second wife, Susanna White, Josiah Winslow grew up in Marshfield, Massachusetts, a town founded by his father, Governor William Bradford's chief diplomat and negotiator with local Native American tribes.

As a young man, Winslow attended Harvard University, but he did not take a degree, which was usual for those not entering the ministry. Instead, Winslow became a soldier, managing his family's property, while advancing in the Plymouth militia, assuming command of the forces at Marshfield in 1652. A solid citizen and man of property, Winslow married Penelope Pelham, a Bostonian of impeccable family, sometime around 1657.

Continuing his political rise, Winslow attained a Marshfield magistracy, then joined Plymouth's War Council in 1658. The following year, upon the death of Miles Standish, Winslow became overall commander of the Plymouth militia. He also served from 1659 until 1672 as Plymouth's delegate to the United Colonies, which various New England settlements had created for mutual consultation.

Throughout his life, Winslow's interests were primarily military and centered on the colony's immediate neighbors, the Native American tribes with whom his father had carried out diplomatic and trade agreements. In 1662, Winslow, acting as a major in the militia, took part in the controversial apprehension of Wamsutta, the son of Massasoit, leader of the Wampanoag, an Algonquian-speaking tribe of eastern Massachusetts.

Wamsutta had sold land to settlers from outside of Plymouth, a breach of a long-standing land policy that directly affected Winslow, one of several important Plymouth leaders with investments in local land. Wamsutta died of a fever at Winslow's house en route to Plymouth, sparking rumors of coercion and murder, especially among the followers of Wamsutta's brother, King Philip (Metacom).

In 1672, the death of Governor Thomas Prince brought Winslow election to the governorship of Plymouth, the first American-born leader of an English settlement. Still primarily a military man rather than a theocrat, Winslow sponsored the building of public schools and unsuccessfully instructed the Plymouth churches to formulate a toleration policy for Quakers and other dissidents.

Winslow's expertise as a military commander was put to the test in 1675, when King Philip's War began in June with attacks on Plymouth's outlying settlements, including Winslow's home at Marshfield. Requesting aid from the Massachusetts Bay Colony and other New Englanders, Winslow created an army of perhaps 1,000 men and was awarded overall authority as commander in chief of the United Colony Troops.

In December 1675, Winslow led this army to Wicklow, Rhode Island, where he established a base to use in attacking the Narragansett, a people he believed were rendering crucial aid to the Wampanoag. On December 19, he and his men devastated the main Narragansett village, eliminating them as a potential threat to Plymouth. Rather than remain in the captured village, Winslow insisted on an exhausting march back to Wickslow in brutal winter conditions, during which many of the wounded colonial militiamen died. Despite his victory in what would become known as the "Great Swamp Fight," Winslow was heavily criticized for the high casualties and his decision to retreat to Wicklow rather than recover and regroup his army.

As a postwar governor, Winslow had to confront the heavy financial and political fallout of the hostilities. A comfortable rather than prosperous colony, Plymouth now faced heavy and unpopular taxes that endangered its independence within New England. To add to the problem, Winslow found himself justifying the war to King Charles II of England, who was displeased that Plymouth had failed to renew its royal charter following the English Civil War. Winslow did succeed in charming the king's emissary, Edward Randolph, who suggested a united New England under Winslow's governorship.

Winslow died in office on December 18, 1680, at his Marshfield estate. He was succeeded as governor by his deputy, Thomas Hinckley.

Winthrop, John (1588–1649)

John Winthrop was one of the major figures of colonial American life. A devout Puritan and a shrewd politician, Winthrop did much to establish an orderly society based on both justice and mercy in the New World; his ideology and actions led to the establishment of what we venerate as the American tradition.

Early Life

Born the son of a country gentleman in Suffolk, England, in 1588, John Winthrop enjoyed a comfortable life. Following two years of studying law at Trinity College at Cambridge University, Winthrop returned home as the steward and justice of the peace of his father's estate. Although Winthrop's journals describe his youth as "wild and dissolute," by the time of his return home, the 18-year-old was married and had clearly begun to develop a sense of his inherited Puritanism.

Like many Englishmen in the early seventeenth century, Winthrop was increasingly alarmed by the growing sense of the Anglican church's oppression of dissent. By the mid-1620s, ministers who refused to adhere strictly to all Anglican tenets were being silenced in growing numbers. It was clear that religious intolerance was on the rise.

Economic conditions in England were also difficult by the end of the 1620s. Winthrop, who by then had seven children and a wife to support, was also a landlord with responsibility for his tenants and his own servants as well. Later in the decade, his family's previously successful cloth business was sinking under the weight of higher prices and rising taxes; similarly, the profits from his sizable grain acreage were being eroded by the government's heavy-handed financial policies. Further, Winthrop's dismay at the dishonesty he perceived at court was widely known, a fact that—in addition to his open and devout Puritanism—likely led to the loss of his attorney's license, although no official reason for its revocation was given.

Such conditions of growing intolerance and oppression in England led many citizens to consider leaving their homeland for the New World. In 1629, Winthrop was elected the first governor of the newly formed Massachusetts Bay Company.

Settlement in America

In March 1630, Winthrop and some 700 colonists set sail for America. While at sea aboard the *Arabella*, John Winthrop delivered his now-classic sermon, "A Modell of Christian Charity." In this sermon, Winthrop articulated the moral code for a godly society in the New World. His exhortation that the colonists must create a righteous society that would be "a city upon the hill" formed the foundation of an ideal of American exceptionalism that has endured.

The *Arabella's* landing at Salem, Massachusetts, on June 12, 1630, must have presented something of a shock to Winthrop and his companions. While the emigrants recognized they were going to an unsettled land, the degree to which sufficient housing and provisions were in short supply doubtless made some question their decision to leave England, no matter what the repressions there.

Soon Winthrop and other leaders moved the seat of the Puritan settlement to Boston; here, a civil government based upon the royal charter was soon established. Two distinctions in this early government of the Massachusetts Bay Colony are noteworthy: First, a theocracy established the joint rule of both civil and church authorities (as opposed to the later American evolution of a separation of church and state). Second, by autumn of 1630, a system was developed that allowed freemen (citizens), rather than only the company's stockholders, the power to elect the colony's leaders.

Creating New England Society

Winthrop was truly a leader in the creation and establishment of New England society. He served as governor of the Massachusetts Bay Colony for all but a few years between his arrival in 1630 and his death in 1649; Winthrop also wielded considerable influence as a member of the Council of Assistants in those few years when he did not win reelection. Accordingly, his vision of New Englanders as God's chosen people—a vision shared by most of his fellow Puritan settlers—was the driving force behind the colony's new life.

While Winthrop did attempt to strike a balance between the authority of the governor and the interests of the governed, it is important to keep in mind the strong religious component of colonial New England life. Both civil and church leaders were quick to point out passages of Scripture that commanded obedience to those in positions of authority.

As a result, there quickly arose a deep intolerance for those whose ideas threatened the Puritan utopia envisioned by Winthrop and his followers. For example, Anne Hutchinson's Scripture study meetings were initially greeted with approval by Winthrop and the Puritan fathers as a useful way of instructing the women who attended. As word of Hutchinson's gatherings spread and men began to attend with their wives, however, those in authority grew uneasy.

When Hutchinson began to express increasingly liberal ideas in her lectures, expounding upon the sermons of Puritan minister John Cotton, and then began to emphasize the individual's need to rely on his or her own "inner light" for appropriate spiritual guidance in the Christian life, Winthrop stepped in. Not only could this new society not tolerate such heretical ideas, he could not allow the authority of the ruling theocracy to be usurped. Significantly, as a woman speaking in public on such topics, Hutchinson was even more of a threat to the underlying patriarchy as well. The ensuing Antinomian Controversy, which raged from 1636 through 1638, condemned Hutchinson, her family, and many of her followers as heretics and resulted in many of these colonists' persecution and eventual excommunication from the established church, as well as their banishment from the Massachusetts Bay Colony.

It was not only Puritan dissent within the colony that concerned Winthrop. In 1643, the governor demanded the capture of the radical Puritan preacher Samuel Gorton in Rhode Island and ordered him and his followers brought to Boston for trial and sentencing on charges of heresy. By 1646, Presbyterians faced heavy persecution in the Massachusetts Bay Colony as a result of their advocacy of more liberal rules concerning church membership.

It is interesting to note that, by the 1640s, officials in England were loosening many religious strictures and were becoming somewhat more tolerant in matters of dissent. However, the geographical distance of the Massachusetts Bay Colony from England, combined with the founders' and leaders' view of their own role as the traditional "nursing fathers" of Puritanism and orthodoxy, resulted in the colony's isolation from any shift toward more liberal viewpoints on religious matters.

While many of Winthrop's attitudes may be difficult to understand, it must be remembered that he and his fellow leaders were driven by two strong impulses that reinforced each other. Foremost was the vision of a Promised Land in the wilderness. The sense of God's protection, sanction, and commission in the unknown of the new land was coupled with a sincere belief that the colonists—particularly their leaders—would be called to account for their actions in God's behalf at the Judgment Day. Combined with this inclination was a desire to establish not a social and cultural democracy, but rather

a gentrified society. Thus, Winthrop hoped to actualize in the Massachusetts Bay Colony the ideal of a somewhat benevolent oligarchy in which each individual had a role to play within the social hierarchy. While all levels of society, Winthrop believed, would necessarily be interdependent, there was no question in his mind but that each person should accept his or her prescribed place and perform his or her prescribed duties within the hierarchy.

By 1645, with the Massachusetts Bay Colony well established in the new land, Winthrop could comfortably write on the differences between natural and civil liberty, saying that the latter could be “maintained and exercised in a way of subjection to authority.” However, by that time, Winthrop had been defeated in two gubernatorial elections by colonists who found his methods arbitrary and unacceptable. In addition, the rising importance of Boston as a seaport contributed to the decline in popularity of Winthrop's ideas. As commerce and contact with the world outside the Massachusetts Bay Colony grew, so too did the colony's worldview. Such exposure rendered Winthrop's ideology largely obsolete by the end of the decade, and, by the time of the governor's death in 1649, the once-despised notion of dissent was becoming increasingly linked in the popular mind to the concept of progress.

John Winthrop's *Journal* offers scholars interesting information on early Massachusetts history, as understood by a man who helped shape much of it. Yet even without reading the written text left by Winthrop, it is clear that his influence pervades much of what Americans have come to consider their heritage.

Witchcraft and Witch Trials

The men and women who traveled to the New World as settlers brought with them a set of social customs and religious beliefs that played a primary role in the development of the British colonies. Among the religious beliefs that these settlers, particularly the Puritans, espoused was a conviction that supernatural powers operated in the world they lived in. The God they worshiped was part of that supernatural world. Their cosmology also included the devil, other evil spirits, and witches.

The widespread belief in witchcraft was evident in colonial laws and the trials of witches that occurred during the period. The prosecution of suspected witches was common in the course of the seventeenth century; however, the hysteria of the Salem witch trials seems to have largely ended the practice of subjecting accused witches to criminal prosecution.

Beliefs About Witchcraft

The concepts of magic and witchcraft were commonly accepted in Europe and the New World. Physical events were interpreted as signs, either good or bad, according to the prevailing religious beliefs and superstitions. The presence of evil spirits was viewed as a direct result of the conflict between good and evil in the supernatural world. Just as God must battle Satan, so too, those people who were part of God's elect found themselves embroiled in an earthly battle with evil, typically in the form of a witch.

Witchcraft was motivated, in the minds of the colonists, by *maleficium*—that is, those who practiced black magic sought to purposely inflict evil upon the men and women with whom they lived. *Maleficium* might be manifested in any number of ways, from minor afflictions to major devastation. Colonial laws similarly defined witchcraft, implying that witches were in close fellowship with the devil or other “familiar spirits.” One colony declared the crime of witchcraft to be “giving entertainment to Satan.”

The signs of such an association with the devil could, according to the prevailing belief system, be found in any number of ordinary occurrences, including the death of an animal, loss of a crop, spoiling of a batch of beer, or coming down with an illness. These common afflictions became associated with witchcraft when those who were subject to such troubles accused another settler of causing the problem through magic. Disastrous events, such as wars

or widespread drought or famine, could also be attributed to the evil intentions of a witch in the community.

Witchcraft was specifically addressed in colonial laws, and most of these laws were adopted in the mid-seventeenth century. Between the years of 1636 and 1647, Plymouth, Massachusetts, Connecticut, Rhode Island, and New Haven adopted such legislation. All of the New England colonies, as well as Virginia and Maryland, prescribed the death penalty as punishment for those convicted of practicing witchcraft. Massachusetts law not only required the execution of convicted witches but also punished those who consulted witches; the consequences of doing so ranged from banishment to death.

Equally important were the colonial laws that allowed settlers to sue for slander those who accused them of witchcraft. New England records report at least twenty-six such cases, most occurring in Massachusetts.

Typical Witches

Colonists believed that any of their fellow settlers had the potential to be witches. Historians have discovered that men and women accused of witchcraft shared similar characteristics, including commonalities in gender, age, marital status, and family.

Women were most commonly accused of practicing evil magic. In New England, 80 percent of those accused were women. Prior to 1640, no men were accused of witchcraft, and only twenty-two men were subject to such allegations during the colonial period.

The typical witch was not only female but also middle-aged, usually between the ages of 40 and 60. In New England, nearly half of all those accused of witchcraft fell in this age range. Stereotypical witches were also usually married. Of those accused in New England, 79 percent were married and another 10 percent were widowed. Single or divorced women were generally not susceptible to such allegations.

Nearly one in six of the accused women in New England had no children, a status that was not typical of women in colonial society. Many of those who did have children had what were considered small families for the time, with fewer than six children. A number of those who faced witchcraft complaints had borne children who died before reaching adulthood.

Another characteristic of the typical witch was the social position she occupied. Few women of the highest social order were subjected to such allegations. Most accused witches came from the lowest ranks of society. These women also engaged in occupations that made them susceptible to charges of practicing magic. In particular, women who practiced some sort of medicinal work, such as midwifery, often found themselves implicated.

A final common factor among those most likely to be accused of engaging in witchcraft practices was a record of previous accusations of other crimes. Forms of assaultive speech, such as slander, were chief among the disturbances that such women had been accused of. In New England, at least twenty of the women facing prosecution for witchcraft had previously been accused of or convicted for verbal aggression. Theft was another common previous accusation. Other offenses included lying, physical assault, sexual misbehavior, and, in one case, arson.

Accusations of Witchcraft

There were numerous reasons why certain colonists accused others of witchcraft. Some allegations of witchcraft were leveled against others as a result of conflict between the parties. Other times, accusations of witchcraft could be used as a means of blackmail for achieving a specific goal such as ownership of a coveted property. The juries who decided the cases rejected most accusations of witchcraft that stemmed from such personal motivations.

Many times, however, charges of practicing magic stemmed from a fervent belief in the supernatural as the reasonable explanation for events that had occurred. Children were often the accusers of witchcraft, the supposed innocence of youngsters lending weight to the charges.

The accusers who leveled charges of witchcraft often exhibited what they claimed were outward signs of the evil worked upon them by the accused. The evidence they produced varied, depending on the supposed action of the witch. Afflicted individuals might exhibit a range of physical manifestations, including seizures, hysteria, and muteness. They also might report a loss of appetite or experiencing sensations of being cut, bitten, or pinched. Oftentimes, those suffering from the afflictions of a supposed witch were young children, whose parents brought the formal charges; the victims of such affliction were generally female. In cases where witchcraft hysteria overwhelmed populations, such "symptoms" could quickly spread to other sufferers, particularly if the accused witch was nearby.

Witchcraft Trials

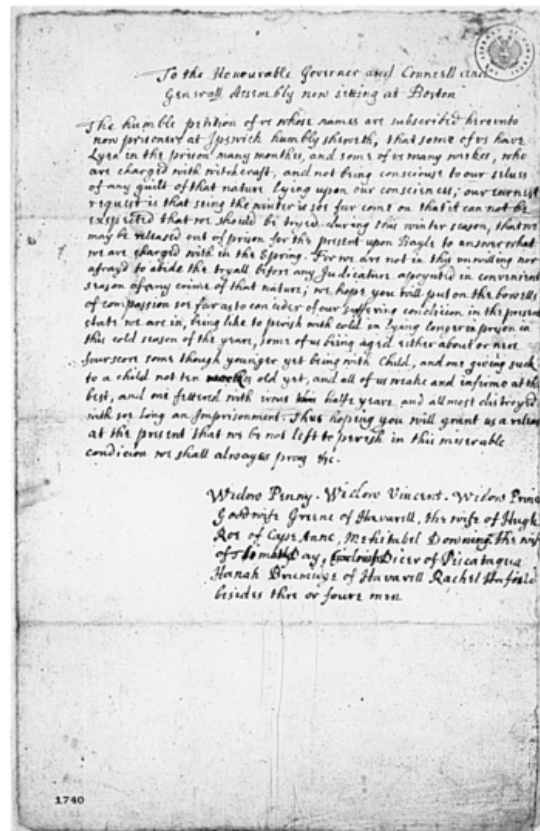

Before a trial began, a suspected witch was often subjected to a series of tests meant to ascertain whether or not he or she was a witch. One such test required a thorough search of a woman's body, looking for physical evidence of fellowship with evil spirits (called familiars) in the form of witch's teats. These were believed to be evidence of the witch's familiars, who were sent out to do her bidding and received sustenance from her body by sucking on the nipple-like mark. Typically, women of standing in the community were gathered to examine the body of a female suspect.

Another test for the presence of a witch was the ancient practice of having the accused, along with several others in a crowd, touch the victim. If the victim was able to distinguish the touch of his or her supposed tormentor, it was believed to be evidence that the latter was a witch.

A third test administered was the water test. The accused witch was bound hand and foot and then thrown into a body of water. It was believed that a guilty person would float, being assisted by the devil; the innocent sank. Other extralegal tests for witches included the requirement that the accused recite a passage of scripture without error. Such a task, it was believed, could not be completed by someone associated with evil.

Prior to indictment for witchcraft, the legal process required the gathering of formal evidence. This was generally obtained through the depositions of witnesses of the events or people associated with the afflicted and the accused. The depositions, in combination with the results of the above tests, were presented as evidence for indictment, which was followed by a formal trial with the verdict to be determined by a jury. The trials allowed for testimony on both sides of the case. Many cases brought before juries resulted in the acquittal of the accused. For those convicted of witchcraft, the punishment was death by hanging.

While the most famous instance of widespread hysteria over witchcraft occurred in Salem, Massachusetts in 1692, accusations and trials of witches began earlier in the century. Prior to the trials at Salem, there were nearly 100 incidents of witchcraft accusations or trials, with about 80 percent occurring after 1648 and resulting in the executions of more than two dozen people. Others were punished for their involvement with magic by banishment and whippings.

A petition by ten women accused of witchcraft in Salem, Massachusetts, appeals for their release on "bayle," lest they "perish with cold." Some are "fettered with irons," and all are "weake and infirme." Hundreds had been arrested. (Library of Congress, LC-MSS-12021-1)

The series of trials for witchcraft that occurred in Salem are the best documented of the colonial era. The episodes began with the accusation of witchcraft by several young girls in Salem, who began experiencing fits that were believed to be the work of witches. After the girls began naming their tormentors, trials began, and six women were subsequently convicted and hanged.

During this time, at least forty-eight other people in the community claimed to be possessed, and accusations flew throughout the small village. The girls and others in the village accused hundreds of residents of practicing magic. Some of the accused confessed to the practice of witchcraft, no doubt hoping to save their lives and property. This decision proved wise, as the authorities determined that those who admitted their evil practices would not be hanged.

Throughout the course of the witchcraft hysteria that spread through much of the colony, nearly 200 people were accused of being witches; almost 75 percent of those accused were women. By the time the trials ended, a total of thirteen women and seven men had been convicted of practicing witchcraft and had been executed, among them George Burroughs, a minister. Giles Corey refused to enter a plea to the charge of bewitching and was pressed to death. Others died while in prison awaiting their trials.

The frenzy of witchcraft accusations eventually reached the highest levels of society, with the governor's wife and the prominent minister of Boston's Old South Church being named as witches. It was accusations of this nature that finally prompted Governor Phips to declare an end to the trials, though these later claims were generally not considered to be serious. The validity of the accusations and trials was addressed by Increase Mather in his essay *Cases of Conscience*, recognizing that the charges of witchcraft were, in many cases, lies. This denunciation of the panic that had gripped the community served to effectively eliminate future witch hunts.

Witchcraft Trials in Other Colonies

Although the widespread agitation that encompassed the colony of Massachusetts generally resulted in the demise of accusations of witchcraft, during this same time period other colonies remained susceptible to similar charges being leveled against its settlers. This was particularly true in Connecticut; however, charges of witchcraft were not new in the colony. In the 1650s, at least two women were executed after being convicted of being witches. In 1662, a supposed coven of witches was tried in Hartford; the result was the execution of four women and the fleeing of many who were associated with the convicted. During the 1692 Salem crises, several women were tried in Connecticut courts, although there were no executions as a result of the trials.

Nearly ninety 90 percent of the witchcraft trials in the seventeenth century were held in one of the Northern colonies. In cases where executions occurred,

95 percent of such punishments were meted out in the Puritan communities of New England. Common beliefs about witchcraft and magic, however, resulted in the accusation of witches in the Southern colonies as well.

In Virginia, most cases dealing with witchcraft were slander cases brought against persons who had leveled accusations of the practice of black magic. In 1655, Thomas Godby's wife, Ann, was brought before the court on charges of slander for having accused other women in the community of witchcraft. The court ruled against the Godbys and fined them 300 pounds of tobacco and the court costs. In Princess Anne County, John and Anne Byrd charged defamation of character against a neighbor who had accused them of afflicting him through their interaction with the devil; the Byrds' charges were dropped.

In other cases, Virginians faced accusations of witchcraft at trials. In 1656, William Harding was sentenced to ten lashes and banishment from the colony after being found guilty of practicing sorcery. Grace Sherwood was accused of being a witch in 1705. Her body was searched for physical evidence, but when none was found, she was subjected to the water test, during which she floated. Sherwood was held over for trial; however, the officials involved in the case seemed uncertain how to proceed, and the case was eventually dropped.

Wolfe, James (1727–1759)

On January 2, 1727, James Wolfe was born into an important British military family at their Kent estate. Along with his younger brother, he was educated with the aim of being commissioned into the army. In 1741, he became a second lieutenant in the 1st Marine Regiment. Wolfe took part in the Ghent campaign as an adjutant, and he was present at the Battle of Dettingen. He impressed the Duke of Cumberland, the commander in chief, sufficiently to be promoted to first lieutenant, then captain of the 4th Foot in 1744. Recalled to Britain in November 1745 because of the Jacobite Rising, he served at the Battle of Falkirk and as aide-de-camp to General Henry Hawley at Culloden in April of 1746.

Wolfe impressed his superior, General Henry Hawley, in helping suppress the Jacobite Rising in 1745. Hawley then further groomed Wolfe by promoting him to staff officer and ordering him to coordinate raids from Fort Augustus against the remaining Jacobites. In the fall of 1746, Wolfe returned to the continental theater as a major and was wounded badly at the Battle of Maastricht.

Despite his stellar record and the patronage of Cumberland, Wolfe had few opportunities once the War of the Austrian Succession ended in 1748. Although he was a solid member of the establishment because of his family connections, Wolfe did not have the financial resources or the aristocratic weight to secure a command. Instead, he ran day-to-day operations for Edward Cornwallis, the absentee colonel of the 20th Foot, who was lieutenant governor of Nova Scotia. In his free time, Wolfe studied classical military treatises and new drill books from Prussia, being particularly fascinated by the new tactic of using mixed skirmishers against columns of troops, which he experimented with in the training of his own regiment.

The chance for action finally occurred in 1757, when he took part in an amphibious assault on Isle d'Aix, Rochefort, France, under Sir John Mordaunt. The operation was a fiasco, and Wolfe both infuriated his superiors and gained the respect of his peers by refusing to criticize Mordaunt at his court-martial. Promoted to rapidly to lieutenant colonel of the 67th Foot, then brigadier general, Wolfe received orders to embark for North America as a

subordinate to General Jeffery Amherst. Wolfe took part in the siege of Louisbourg, commanding an artillery battery responsible for both bombarding the walls of Louisbourg and destroying French ships off the coast. When Louisbourg surrendered in November 1758, Wolfe ignored Amherst's orders and returned to London in order to beg a European command from Ligonier. When refused, he volunteered to lead the siege of Quebec.

The death of General James Wolfe is dramatized in a famous painting by Benjamin West. Wolfe died at the Battle of Quebec in September 1759, as did his adversary, France's General Montcalm. The British victory secured Canada from the French, and Wolfe was lionized as a martyr. (Private Collection/Phillips, Fine Art Auctioneers, New York/Bridgeman Art Library)

Having received this command, Wolfe embarked for Canada as part of a three-pronged attack on the French at Fort Niagara, Fort Ticonderoga, and Crown Point, and his key objective, the fortified city of Quebec. Wolfe had his pick of junior officers and assigned Isaac Barré as his adjutant general and Guy Carleton as his quartermaster. Arriving in May 1759, Wolfe conducted extensive reconnaissance of the area on both sides of the St. Lawrence around Quebec and destroyed French settlements to aid in the siege. By September, the pressure of soon losing naval support, due to the winter freezing of the river, pushed him to attack. On September 13, Wolfe and his men, including militia contingents from New England, crossed the St. Lawrence before dawn and, landing at the Foulon Road, marched on Quebec in thin, two-rank rows for frontage as they crossed open fields. The Marquis de Montcalm, the French commander, ordered his troops out of the city to meet the British on the Plains of Abraham. Wolfe, taking an observation position to the right of the line, was wounded three times, and he died on the field. A deserter from the 60th Foot was later court-martialed and executed for Wolfe's death, but some of the three shots were undoubtedly fired by French snipers. Wolfe died early in the battle, but his subordinates carried the day against the French, and the city of Quebec surrendered on September 18, 1759, securing Canada for the British.

Wolfe was lionized as a martyr and depicted as the savior of British North America, but his real influence lay in studying and disseminating Prussian tactics such as alternate firing and bayonet drill. In 1768, his *Instructions to Young Officers* was printed and thereafter sold briskly throughout the rest of the century. Wolfe's legacy was not a heroic death on the Plains of Abraham but the lasting foundation for British army training and the fierce discipline that delivered victory in the Napoleonic Wars.

Women

The lives of women of European descent in the colonial Americas had much in common with those of women in Europe. They were subordinated within patriarchal institutions and subject to their fathers, husbands, and, when outside those family relationships, the men of church and state, who were also

styled as “fathers.”

In much of Europe, married women could not own property in their own names and were legally represented by their husbands. Often, women's daily lives were taken up with domestic concerns, keeping house or caring for children—in the case of unmarried women, perhaps as servants, mistresses, or even nuns (who frequently ran schools for girls and tended to the domestic needs of male and female religious orders alike). Women's work did vary greatly, however, according to their class and location.

Life in the colonies created opportunities, interactions, and relationships that differed from those found in Europe. Many women were able to participate in politics, commerce, religion, and intellectual life, thus going beyond traditional roles.

European colonization of the Americas had a negative impact on indigenous women and on African women brought to the New World as slaves, but here, too, victimization is not the only story. Tensions between tradition and change, limitations and opportunities, mark the experiences of women in the Americas during the colonial period.

Native American Women

When Christopher Columbus first set foot in the West Indies, what would come to be known as the Americas were inhabited by millions of people from thousands of native cultures, about half of whom, we can assume, were women. At the beginning of the European presence in the Americas, the enterprise of exploration and colonization was almost wholly undertaken by men, although the land and its native inhabitants were frequently characterized as feminine in ways that helped justify conquest and had very real consequences for the women and men who lived here.

During the early years of encounter and conquest, native women sometimes served as translators and go-betweens. This may have reflected their secondary and thus nonthreatening status in both the cultures they bridged. Doña Marina, often known as “La Malinche,” and Pocahontas are the two most famous such women.

Because of the paucity of European women in the colonies during the sixteenth century, sexual relations between European men and native women also played an important role in shaping the power dynamics of conquest and of gender relations for generations to come. Ranging from rape and forced concubinage to marriage and consensual intimacies, these relations ranged from basely exploitative to highly beneficial financially and socially to the women involved.

Likewise, conquest had a mixed effect on native women's social and economic roles. Women were often forced to accommodate themselves to the sexual division of labor imposed by Europeans, which differed from their preconquest roles. This usually involved a loss of traditional prestige and power. For instance, some women who were traditionally responsible for planting and harvesting were pressured to confine their labors to domestic tasks that Europeans deemed more feminine. Others were required to undertake the bulk of tribute labor or were forced into personal service.

As a consequence, women's social and familial roles were disrupted, and the tribal power they had once held was sapped, rendering them as legally disempowered as European women. There are also examples of native women using the colonial legal systems to sue for redress and petition for rights traditionally unavailable to them. For some women, these changes provided new opportunities to participate in trade in urban centers and gain other kinds of cultural power by negotiating the borders between Native American and European cultures.

For the most part, however, conquest and colonization had a devastating impact on Native American women, both through the effects that disease and armed conflicts had on individuals and communities and through transformations in their social roles. By gaining cultural knowledge and participating in shaping New World communities that were rooted in cultural exchange and personal interactions, some native women adapted and thrived, thereby helping to shape colonial society as a whole. And some, like Weetamoo, the widow of Wamsutta and an important sachem in her own right, asserted themselves as tribal and military leaders in resistance to European incursions.

African American Women

African women are known to have been in the Spanish and Portuguese colonies as early as 1535, when a slave name Margarita accompanied conquistadors in an expedition to conquer Chile. They were also present in the British, Dutch, and French colonies at least as early as 1619. Almost all of these women came unwillingly.

Some 30 to 40 percent of the 3.5 million Africans forcibly transported to the Americas throughout the colonial period were women. Most served as slaves or indentured servants, though communities of free blacks also existed. As servants or slaves, black women's work crossed traditional gender boundaries—they worked in house and field alike, belying European notions of women's proper place, while uncovering the white colonists' dehumanizing attitude toward Africans.

Whether a black woman, free or slave, was in an urban or rural area also influenced her experiences of family and community. In cities, enslaved women were more acculturated, since they often inhabited households with few or no other servants and were isolated from larger communities of Africans. Some enslaved women in cities were able to earn money through cooking, sewing, and vending enterprises in which they agreed to pay their masters a set fee, while keeping profits that exceeded that fee. By doing so, such women were sometimes able to purchase their freedom and the freedom of their children and other family members. In areas where farm labor was organized on a task basis, as in South Carolina (enslaved laborers were assigned tasks that needed to be completed but were not required to work particular hours), women also might engage in forms of economic enterprise outside their assigned tasks. In both cases, such opportunities were limited by the power of masters and the bias of laws, forces that often worked against free blacks as well, despite their putative independence.

Enslaved African women were frequently exploited sexually by white owners for pleasure and economic advantage. This was especially true once laws such as the one passed in Virginia in 1662 declared “all children born in this country shall be held bond or free only according to the condition of the mother.”

Enslaved women in the Americas were more likely to experience some kind of family life, especially among female family members, than enslaved men, who were often separated from their parents and children alike. And because of their ties to children and older family members, women were less likely to attempt escape.

In North America, the number of Africans in the colonies remained relatively low until later in the seventeenth century, when they were allowed to marry and become free landowners. During the late seventeenth century and throughout the eighteenth, the number of blacks both born in and brought to the Americas soared, as economic and social practices, along with supporting laws and ideologies, institutionalized slavery.

The experiences of black women in the Americas during the colonial period were more varied than is often recognized. But the institutionalization of slavery in the colonies increased the legal and social restraints placed on both free and enslaved blacks at the same time that the population of black women in the Americas was increasing dramatically.

European-American Women

Thirty Spanish women accompanied Columbus on his third voyage to the Caribbean in 1478. By 1540, European women were present in most Spanish-American cities, but their numbers did not begin to swell until the 1560s. Women from France, England, and the Netherlands did not begin to settle in North America until the seventeenth century.

In New France and New Spain, sexual relations between European men and native and African women created mixed-race populations categorized as Métis or mestizos. However, enduring colonial stability was seen by most Europeans to depend on the presence of European women, who would enable settlements to grow through natural increase, rather than continued immigration or the official recognition of mixed-race populations.

Many of the first European women to arrive in the Americas came as part of attempts to stabilize settlements through the development of European families. Sometimes early male settlers arrived with their wives or had their wives or fiancées follow them across the Atlantic. Single women also came as indentured servants or explicitly as future brides. It was not until the settlement of the Massachusetts Bay Colony that women and families participated in the development of a new colony at its beginnings. New England was the first successful colony the settlement of which was not primarily motivated by dreams of conquest and economic exploitation.

Gender imbalance benefited early female colonists, who could afford to be selective in choosing husbands. Because of high mortality rates, women frequently accrued sizable fortunes through successive husbands, gaining a degree of wealth, social eminence, and political power that would have been less accessible to them in Europe. Nonetheless, as wives and servants, women were legally subordinant to their husbands and masters and still at the mercy of double standards that governed their sexuality and judged their behavior.

The hardships of life in the new settlements forced many women to participate in farming and other forms of physical labor that were largely men's work in Europe, making their traditional household duties more difficult. Also, infant mortality rates were high throughout the colonial period—most women suffered the deaths of children either personally or through losses among family and friends.

As with family roles, legal status, and economic opportunities, there was much continuity between women's religious lives in Europe and in the Americas, but the New World also provided opportunities rarely available before. Religious beliefs and practices provided spiritual sustenance and avenues of community involvement and self-expression for numerous women, but Catholics and Protestants alike tended to reinforce patriarchal authority, particularly by silencing women's public voices on religious matters. There are myriad examples of women facing such silencing in the early colonies. Anne Hutchinson and Sor Juana Inés de la Cruz are just two of many women to be silenced for speaking or writing publicly about religious matters.

The project of converting Native Americans to Christianity and spreading the word of God in the New World, a project that was both heartfelt and useful as a way to justify and raise funds for colonization, allowed many women to skirt the limits placed on women's public speech. Nuns who came to the Americas to establish convents, schools, and hospitals were often motivated by missionary zeal, a zeal they wrote about in letters and reports that drew attention (and funding) to their endeavors. Quaker women—including Mary Fisher, Anne Austin, Elizabeth Hooton, and Joan Vokins—were among the most adventurous of the early women missionaries to the Americas, seeing colonial settlements and not just “heathen” communities as important targets for their preachings. These women also were some of the most prolific writers.

Social experiments founded on religious dissent, such as the Massachusetts Bay Colony, allowed women to express their own dissent, even in the face of silencing from patriarchal forces. Arguably, the participation of Anne Hutchinson and other women in the Antinomian Controversy was enabled by their experience of Puritan challenges to social and political control of religion in England.

The violence of the frontier and other elements of colonial life led to more dramatic expressions of religious belief, such as the captivity narrative of Mary Rowlandson and the testimony of women and girls during the witchcraft trials of the late seventeenth century. Various popular spiritual movements of the seventeenth and eighteenth centuries put “feminine” enthusiasm in the foreground, attracting numerous women.

Restrictions

Women were largely excluded from formal education throughout the colonial period. John Winthrop famously observed of the studious and ailing wife of the governor of Hartford,

if she had attended her household affairs, and such things as belong to women, and not gone out of her way and calling to meddle in such things as are proper for men, whose minds are stronger, etc., she had kept her wits, and might have improved them usefully and honorably in the place God had set her.

Few women had access to more than a rudimentary education, both because they were women and because of the limited educational available to anyone not of the more privileged classes. In Catholic colonies, girls might have access to convent schools, such as the one established by the Ursulines in Quebec in 1639 for both the daughters of French colonists and native girls, or to schools taught by *beatas* in Spanish-ruled countries. Although

women's educational opportunities were limited throughout this period, these expanded during the eighteenth century as literacy increased, print culture changed the intellectual landscape of the colonies, the number of female entrepreneurs opening schools increased, and women's education became linked to colonial self-determination.

In the early years of the United States, the ideology of "republican motherhood" encouraged women's education so that mothers could raise well-educated, patriotic children. Women's roles as teachers of young children and older girls at home, as well as in convent and grammar schools, led to an increased focus on their intellectual development, worldly success, and educational opportunities that helped give rise to later feminist movements.

Just as education for women was limited in the Americas as in Europe, women were less frequently encouraged and recognized as poets, writers, and artists than men throughout the colonial period. Those who were recognized were usually treated as rare exceptions, as the title *Tenth Muse*, given to Anne Bradstreet and Sor Juana Inés de la Cruz, two of the best-known American women poets of the seventeenth century, attests.

Nonetheless, women like Bradstreet were successful in male-dominated literary and intellectual circles during the seventeenth century, and recognition of such women increased throughout the eighteenth century. For evidence of rich artistic cultures flourishing outside the publishing world and other avenues of official recognition, we also can look to forms of artistic expression that often do not register in male-centered histories, such as quilts, diaries, and letters, as well as literary salons and circulating commonplace books.

In exploring the ways in which gender shaped the lives of women in the Americas, issues of family and reproduction are some of the first concerns, as we have seen. Domestic roles and life experiences related to marriage and childbirth were shaped by the rigors of colonial life, patterns in women's immigration from Europe and Africa, and relationships among different races and classes in New World societies and economies. Indeed, the colonies themselves were shaped by these forces—issues of sex and gender did not only affect individuals.

Colonial America also provided new opportunities for women outside their prescribed roles, whether they were of European, African, or Native American descent. Women participated in religious missions, social experiments, educational reforms, and artistic expression, all linked to the growth of European colonies in the New World.

Wright, Susanna (1697–1784)

Susanna Wright, poet and scientist, was born August 4, 1697, in Warrington, England. Her parents, Patience Gibson and John Wright, moved to Chester, Pennsylvania, in 1714. Susanna Wright stayed in England to complete her schooling and then joined her family in America. She continued to study throughout her life, and her letters demonstrate fluency in French and competency in Italian and Latin. Gifted in many fields (including as a water-colorist), she was a leading intellectual figure in colonial Pennsylvania.

Wright's unmarried state was no protection from heavy household responsibilities. When her mother died in 1722, she took responsibility for her father's household and raising her seven younger brothers and sisters, as single adult women were expected to serve their families in such roles. Later, she helped with her brother James's family. In her role as housekeeper and surrogate mother, Wright supervised all the heavy chores of a colonial household, including domestic manufacture of cloth and clothing, care of livestock, and food preparation and preservation.

Her father, John Wright, began traveling to the frontier as a Quaker preacher to the native peoples. In 1724, he stayed with the Native Americans at Shawana Town in the Susquehanna Valley. Two years later, when the natives moved to Conestoga Indian Town, John Wright, Susanna Wright, Robert Barber, and Samuel Blunston purchased about 1,000 acres in the area.

John Wright received a patent to operate a ferry in 1730, and the area became known as Wright's Ferry. The Wrights' house also served as an inn, which Susanna ran. In 1738, Susanna Wright designed Wright's Ferry Mansion for her brother.

In 1745, Wright finally achieved the independence of her own household, when widower Samuel Blunston, a close family friend, willed her a life interest in his nearby property. She lived on that property until her death.

With interests in nature and access to her father's books on medicine, Susanna Wright became a skilled herbalist, who prepared and prescribed medicine for her neighbors. She also regularly corresponded with other leading Pennsylvania scientists, including James Logan and Benjamin Franklin. Her scientific experiments extended to agriculture, including silkworm cultivation. Wright won a 1771 prize offered in Philadelphia for the person cultivating the most silkworms, and Benjamin Franklin presented Queen Charlotte with a piece of Wright's silk, which was then made into a court dress. The Philadelphia Library Company has preserved a piece of her homespun silk.

John Wright was a justice of the peace and a long-time member of the Pennsylvania Assembly. Neighbors turned to Susanna Wright in her father's absence. She drafted wills, deeds, and indentures for neighbors unable to write. Through her scribe's duties, she had become involved in politics and elections in 1742, and she succeeded Samuel Blunston as prothonotary after his death. Greatly respected by her neighbors, she also settled local disputes.

Wright wrote regularly throughout her life but did not keep copies of her own work. As a result, scholars can only find a small sample of her writings. That work shows great skill in blending spiritual and intellectual concerns, and at least two poems reveal a strong voice for equity for women. Her poems were often addressed to women and used ordinary life events to make profound observations.

Wright gained literary fame as a poet by circulating her work in manuscript form. Her correspondents shared her writings with others and, in turn, sent her their own work. Manuscript circulation was an accepted part of the eighteenth-century literary world. Friends might copy poems into journals or keep a copy before sending the work on to others. For example, Wright's poems were used as texts for girls studying at Quaker schools in Philadelphia. She became part of a lively intellectual circle of friends that included a number of other women poets, including Elizabeth Graeme Fergusson, Hannah Griffiths, and Deborah Logan. The largest known group of Wright's poems is in a manuscript commonplace book kept by Milcah Martha Moore, who used the book to create her own selective anthology of materials she read.

Wright's reputation grew. In her later years, many people made the trip to Wright's Ferry to meet her, including Dr. Benjamin Rush. He noted in his journal that he had met "the famous Suzey Wright a lady who has been celebrated Above half a Century for her wit—good Sense & valuable improvements of mind." Susanna Wright died on December 1, 1784, in Pennsylvania.

Yale College

Established in 1701 by a group of ministers to combat the latitudinarianism, or tolerance of various religious doctrines, of Harvard in nearby Massachusetts, Yale was Connecticut's first college. For sixteen years, this "Collegiate School" had no fixed campus and operated out of private homes in Hartford, Saybrook, and New Haven. It was only in 1717, when the colony's General Assembly granted the college the sum of 500 pounds to build its first college house, that New Haven, the colony's largest urban center, was selected as the school's permanent home.

In its early decades, the college benefited enormously from the money-raising efforts of Jeremiah Dummer, Connecticut's agent in London. In 1714, Dummer endowed the college library with 800 books he had personally solicited from their authors. This gift—which contained sought-after works by Locke, Newton, Halley, Steele, Raleigh, Chaucer, Milton, and Bacon—at one stroke transformed the college's library into the finest in New England. Four years later, Dummer persuaded Elihu Yale, a wealthy Londoner who had made his fortune as governor of Madras, to donate 417 books and goods worth 562 pounds. This endowment—the largest single donation from any private group or individual until well into the nineteenth century—secured the patron's posterity when the college renamed itself in his honor later that year.

Although staffed mostly by young Harvard graduates, Yale quickly took New England higher education in a new direction. While the curriculum was built around the traditional subjects being taught at Harvard and in England, Yale soon acquired a reputation in science and divinity. By the 1720s, the new science and philosophy of Newton and Locke was being taught; and by the 1750s, owing to the enthusiasm of President Thomas Clap, Yale became the first college to demand knowledge of arithmetic as a condition of admission. Clap procured scientific instruments for the college, including a frictional electrical machine donated by his friend Benjamin Franklin, and built an orrery to show the movement of the planets.

While never a Calvinist seminary, Yale graduated a large number of ministers, particularly in its first four decades, and frequently fell prey to religious controversy. In 1722, accusations of Arminianism—the brand of antiauthoritarianism that fed Methodism—were leveled at several faculty and tutors, forcing their swift departure from New Haven. Twenty years later, as much of New England embraced the “New Light” radicalism of the Great Awakening, the administration came under fire for its condemnation of Arminian apologists like George Whitefield and James Davenport. Insisting on Calvinist orthodoxy, the college expelled students who refused to apologize for their New Light sympathies or attended unauthorized meetings. Facing religious criticism on all sides, President Clap, a man selected for his conservative Calvinism, soon moved to establish Yale's own college church, the first in America, to insulate his students from the false religions swirling outside its doors. In 1745, he also amended the college charter to establish the college as a perpetual corporation, legally autonomous and protected from outside religious or political influence.

Following the excitement of the Great Awakening, student-administration relations only worsened. Unconnected disciplinary infractions slowly escalated into a series of riots in the 1750s, as the authoritarian Clap sought to keep control of a college population expanding faster than the resources necessary to provide for it. In 1764, students poisoned the food at the underfunded commons to protest the bland, repetitive diet of bread, salted pork, and milk. Poor commons, rising tuition charges, and excessive restrictions on personal liberty fueled rebellions that by the 1760s seemed nearly continuous. In 1766, when two tutors resigned after their windows were smashed and their lives threatened by students angry at maladministration, Clap was finally forced to leave. The college nearly closed while the trustees scrambled to restore order.

Yale College was founded as the Collegiate School in Connecticut in 1701. The first campus building in New Haven, its permanent home, dates to 1717. The institution was later renamed for its first major benefactor, Elihu Yale. (Brown Brothers, Sterling, Pennsylvania)

The appointment of acting President Naphtali Daggett inaugurated a decade of reconciliation during which students and faculty came together in anti-British sentiment. Following the Townshend Duties in 1769, the Yale senior class voted to appear at commencement entirely in homespun and used their graduation speeches to argue against “the Unconstitutional measures of the British Parliament.” In 1775, students formed their own militia company, and, over the next six years, Yale's sons came to form half of the field officers in the Connecticut militia.

By 1775, Yale had long since assumed equal status with “Mother Harvard.” It had graduated more students in seventy-odd years than Harvard had managed in almost twice that time. Yale's graduates—ministers, doctors, and a growing number of lawyers—were assuming positions of power all over the new nation. They also had been influential in founding most of the seven colleges established during the Great Awakening, making Yale's nineteenth-century progressive leadership a model for American higher education for a long time to come.

Yamasee

The Yamasee Indians are most closely associated with a single event in the history of the colonial Southeast—the Yamasee War. Apart from their role in the years leading up to this war and its aftermath, not much research has been done on Yamasee origins and culture. Usually, they exist primarily in historical literature as foils to English colonization.

The Yamasee, like most seventeenth- and eighteenth-century tribes, were multiethnic. That is to say, people speaking different languages and adhering to different cultural practices could consider themselves Yamasee. This obstacle to identification is compounded by the fact that it was usually Europeans, with limited ethnographic skills, who were doing the classifying. From 1650 to 1715, the Yamasee lived near, essentially among, both the Spanish and English in the Southeast. They fought alongside and against both of those colonies. They dispersed as a distinct political unit in the aftermath of the Yamasee War, but in the 1950s, a group previously identified as Altamaha Cherokee began working to reassert their Yamasee identity. Currently, the tribe is not recognized by Georgia, South Carolina, or the U.S. government.

The language and culture of the Yamasee have been the source of much controversy about their identity. Since they drew on populations throughout the Southeast, they spoke their own indigenous languages; however, they also communicated with each other and the outside world using a trading language, or lingua franca. This should hardly be surprising, since recent scholarship about the Creek, Choctaw, and Catawba suggests that these groups were essentially multiethnic as well. The Yamasee first appear in written historical records in 1663, when a Franciscan friar operating north of St. Augustine noted their arrival, though not their area of origin. They seem to have been able to understand the language of the Creek, itself a hodge-podge of Muskogean tongues.

From the 1660s to the 1680s, the Yamasee were loosely associated with Spanish colonization in Florida. They did not participate to the same extent as other groups. The Yamasee avoided joining mission communities. They also resisted Spanish attempts to alter their culture and force them to pay tribute and labor obligations. The fact that the number of people considered to be Yamasees grew rapidly indicates that the group readily accepted refugees from neighboring communities.

In the mid-1680s, the Yamasee emigrated en masse from Spanish Florida to just outside of Charles Town; at the time of their remove, they may have numbered in the thousands. The English colony at Carolina provided trade goods and firearms, which the Spanish friars were more reluctant to do. The English also had little interest in converting the Yamasee and did not hold their non-Christian status against them. The push factors also should not be overlooked: in the 1670s and 1680s, the Spanish made new attempts to draft Yamasee into their labor force and urged participation in mission life.

Over time, the Yamasee became among Carolina's staunchest Native American allies. They participated in military actions alongside the Carolinians in 1702, 1704, and 1710. In 1702, Governor James Moore launched an attack on St. Augustine. Moore's force of Yamasees, Creeks, and Apalachicolas destroyed the town but failed to take the stone fort.

In 1704, having lost his post, Moore and his army of natives struck Apalachee, a more prosperous mission province to the west. The attack resulted in a stunning defeat for the Spanish and mission natives. Several hundred perished, and over a thousand were carried off as slaves.

In 1711, the Tuscarora attacked the fledgling colony of North Carolina, and the Yamasee again aided the South Carolinians. A force of 500 Native Americans, mostly Yamasees, served with John Barnwell and later with James Moore, Jr., in another campaign. The Yamasee again made off with numerous slaves for sale at Charles Town.

The Yamasee War (1715–1717) is sometimes referred to as the earliest pan-Native American uprising in North America. Upset by traders' abuses and encroaching white settlement and livestock grazing, a broad coalition of Native Americans—including Creeks, Yamasees, and members of smaller tribes—killed white traders in their villages and then turned on a terrified English populace. The English threw together an army of mercenaries, servants, slaves, and militiamen to counter the initial attack. Eventually, the Carolinians enlisted the assistance of the Cherokee, a powerful interior nation, and defeated the Creek and the Yamasee. In the aftermath, the Yamasee scattered throughout the Southeast. Many returned to Spanish Florida, whence they continued to harass the English for years.

While Yamasee history may be manipulated to serve a variety of purposes, new archaeological evidence is continually being unearthed. The recovery of more Yamasee artifacts and the creative use of historical documents, combined with the continued assistance of the Altamaha Cherokee, may provide increasing certainty about Yamasee culture in the years to come.

Yamasee War

The Yamasee War was the pivotal conflict in determining whether the North American Southeast would be Native American or English land. It broke out when a pan-Native American coalition attacked traders and outlying white settlements on Good Friday, 1715, and petered out in 1717 when the Cherokee entered the war on the English side, forcing the Yamasee to scatter among Spanish missions and other Southeastern native communities and forcing the Creek to negotiate peace.

As in most conflicts, there is no single explanation for the outbreak of hostilities between the English and their neighbors. The Yamasee had been close allies of the Carolina colony, participating in slaving raids against the Spanish and their allied mission natives in 1702 and 1704. The Yamasee also played a major role in the subjugation of the Tuscarora during the Tuscarora War (1711–1715). The Yamasee had been pushed out of Spanish Florida by renewed forced labor drafts and increasing cultural pressure from the missions, and they were drawn toward Carolina by more plentiful opportunities for trade and the acquisition of firearms.

Traditional interpretations of the war suggest that unscrupulous traders operating out of Carolina angered the Yamasee sufficiently to cause war, but more recent theories point to a wide array of factors, of which trade debts were merely one. The Yamasee had been among the prime movers in the far-reaching Native American slave trade that grew in the Southeast in the late seventeenth and early eighteenth centuries. It was their very effectiveness as slave raiders and providers of deerskins that brought the Yamasee into conflict. They, and other groups who had occupied Port Royal before them, had likely overhunted fragile deer populations and overraided nearby native communities. By 1715, they had essentially outlived their usefulness to the shrewd English colonists.

The Yamasee also inhabited what was considered prime agricultural land, which may seem confusing, considering its swamp-like qualities. Carolina was becoming a rice producer, and Yamasee lands were ideal for the purpose. The colony's government recognized as much when it set apart some land for the Yamasee in an effort to curtail white settlement. The colonial government in South Carolina was not totally in the dark about rising tensions and, in the early eighteenth century, it made a number of moves to halt trading abuses and regularize relations with the Yamasee. However, the colonial government was weakened by factionalism, and, in any event, the damage had already been done. In April 1715, the Yamasee, Creek, Cherokee, and Chickasaw, together with numerous smaller tribes, killed the traders in their villages, including Thomas Nairne, the newly appointed South Carolina Commissioner of Indian Affairs.

In the next phase of the war, there is little evidence to indicate that the Creek, Cherokee, or Chickasaw participated. The Yamasee, with help from smaller native groups, began to attack white plantations, driving the effective line of white control back toward Charles Town. The colonists, fearing that they were facing an alliance of Creek, Cherokee, and Chickasaw (which certainly could have destroyed the colony), threw together an army of indentured servants, mercenaries, militiamen, and slaves. Other colonies, sensing the gravity of the situation, chipped in with munitions, food, supplies, and armed men.

In fact, the Creek, Cherokee, and Chickasaw had no desire to crush what they viewed as a valuable trading partner. They made it clear that they intended peaceful relations with the English. An agreement to end hostilities was made in late 1717.

After this conflict, the Yamasee scattered among many Southeastern tribes. Some stayed in Florida, and from there launched raids against ever-expanding English plantations. The Carolina border was not entirely secure until the settlement of Georgia.

Historians have speculated since the eighteenth century about French or Spanish involvement in the Yamasee War. While both European powers could have benefited from a successful campaign, France's hold over the Lower Mississippi Valley was very tenuous. Spanish Florida was crumbling, and it does not seem likely that the Spanish could have incited the attack. They welcomed refugees and were never sad to see a few English Protestants get killed. Hypothesizing in this manner also takes away from the fact that, in 1715, the Yamasee were perfectly capable of conducting their own affairs by assembling a coalition to fight abuses.

The long-term result of the Yamasee War was to ensure that Carolina would continue to trade with Creek, Chickasaw, and Cherokee, forgoing peaceful relations with smaller tribes, while currying favor with more powerful ones. Although it took some time, the areas around Charles Town also began to produce the rice that would eventually make South Carolina North America's most African and wealthiest colony.

Yeomanry

The yeomanry originally designated a group of small, independent commercial farmers in England, who, during the course of the seventeenth century, ceased to exist as a result of industrialization and enclosure. In colonial America, “yeomanry” referred to a class of small farmers, who owned their own land, grew their own food, and produced goods for the market.

The term is a broad one that encompassed several different kinds of farmers. Many yeomen owned relatively small plots of land, 100 acres or less, while others owned larger tracts. Some yeomen owned slaves, some did not. All yeomen, regardless of their position, relied on the labor of their wives and children to make their farms viable and assumed authority over them.

The yeoman class also exhibited differences in various parts of the country as a result of relations with other social groups. In the North, yeomen defined themselves, in part, by their struggle against large-scale capitalists to maintain their economic security and independence. In the South, yeomen contended for control of the state with planters, although they shared with them an ideal of local self-sufficiency and joined with them to avoid peonage, or economic dependency on large landholders.

Land

The yeomanry formed out of the struggles over land that occurred during the seventeenth century. Many colonists came to the New World seeking land of their own, and they successfully acquired property through warfare with Native Americans or grants from colonial authorities. By the latter half of the eighteenth century, between two-thirds and three-quarters of white, male householders were freeholders who owned land in places as diverse as Connecticut, eastern Massachusetts, Long Island, New York, and Tidewater, Virginia.

Yeoman farmers consolidated their position as free landowners during the Revolutionary period. The concept of independent landholding was dear to yeomen who, when threatened with the loss of land tenure, were known to petition legislatures and to riot. To them, landholding signified security, independence from economic subservience, and freedom from dependence on other men for land or wages.

The Whig gentlemen who led the American Revolution understood that to mobilize yeoman farmers, who constituted a significant portion of the population needed to fight the war for independence from Great Britain, they would have to appeal to their fears of losing their land. Revolutionary leaders spoke to the yeomanry of the English ministers as cunning men, who, in Samuel Adams's words, were threatening to “take away your Barn and my house” and, according to John Adams, intended to tax land and property and “reduce the country to lordships” by remaking yeomen into tenant farmers and wage laborers.

The success of these appeals depended on previous relations between yeoman and gentlemen. Where anti-British Whig gentlemen landowners had protected the property rights of yeomen—for example, in New Jersey, eastern Pennsylvania, and eastern Carolina—yeomen often joined the cause. In places where yeomen perceived gentlemen landowners as enemies who ignored their interests—Vermont and the Carolina backcountry, for instance—they backed the British.

Those yeomen who had supported and fought in the Revolutionary War realized their position of strength and demanded an active role in the formation of public policy in exchange for military service. They argued that their position as property owners made them independent, freethinking men, and therefore guaranteed them political rights. Furthermore, they contended that the new government should be a democracy, consisting of property owners, who could not only express their views through elected representatives but could assert their will through other, more direct means.

Political Ideology

The radical Revolutionary rhetoric of the yeoman farmer provided the foundation for the creation of a powerful and durable political ideology, usually referred to as “Jeffersonian agrarianism.” Following the Revolution, Americans debated the terms of the new political and social order. The Federalists, led by Alexander Hamilton, favored a strong central government and the holding of political power by the landed few. The Republicans, led by Thomas Jefferson, believed in the primacy of local government and a primarily agrarian national economy.

The Republicans were determined that there would be no aristocracy in America. They envisioned an ideal society, a republic based on small, independent producers (i.e., the yeoman farmer). In such a republic, every man would be able to acquire skills and independence, and his independent, industrious lifestyle would provide the basis for fulfilling civic obligations. They believed that the best kind of social order for establishing this kind of polity

was one in which the majority of the country's white, adult males retained their independence as property owners.

This view reflected the belief that only truly free men could be entrusted to choose representatives and to judge their performance. Jefferson further contended that only widespread landholding could create an independent social group capable of preventing the seizure of power and corruption of the republic by wealthy merchants, lawyers, and gentlemen. At one time, Jefferson even drafted legislation that would have given all free men in Virginia 75 acres of land upon marriage.

Economics

Besides serving as an icon for the nation's political ideals, the yeoman farmer also provided the inspiration for the development of economic and moral ideals. As an independent producer, the yeoman represented the basic source of wealth for the nation, providing its inhabitants with agricultural produce, minerals, and other commodities.

The figure of the yeoman farmer also represented morality to many thinkers and writers, who associated a life working the soil with virtue. In their view, the rural atmosphere created a better person, one more honest, industrious, and immune to the temptations of luxury.

The independent, industrious, and upright yeoman farmer became the preeminent symbol and hero of the agrarian eighteenth century. As economic and technological change brought challenges to the agrarian way of life, Americans debated the role of industry and agriculture in society. Within this context, the yeoman farmer as a noble cultivator and free citizen gained currency, and the idea of a republic of virtue populated by noble cultivators acquired mythic proportions. The "yeoman dream" became a foundational ideology that referred to the American ideal of traditional success: personal, moral, financial, and religious achievement open to all, regardless of class or occupation.

The yeoman dream resonated not only in the political arena, but in the economic, social, and cultural realms, and it came to be celebrated by various writers and spokespeople in the eighteenth century and the first half of the nineteenth century. Literary representations of the myth of the yeoman included James K. Paulding's *The Backwoodsman* (1818) and Timothy Flint's *Recollections of the Last Ten Years* (1826), both of which portray agrarian democratic utopias set in the West.

Lydia Maria Francis Child extolled the yeoman dream in her periodical, *Juvenile Miscellany* (1820s–1834), which provided a mixture of fact and fiction and aimed to inculcate good behavior in young readers. Writing under the pen name Peter Parley, the popular children's author Samuel Griswold Goodrich portrayed America as the last refuge of the yeoman dream. Both Child and Parley emphasized that the competence and independence of a yeoman society could be attained by any American, if pursued in a moral fashion.

Farmers' magazines naturally praised the yeoman dream, but labor periodicals also publicized the agrarian ideal of traditional success. Labor journalists adapted the image of the yeoman farmer to create for their readers the image of a competent, independent, and moral yeoman mechanic, who would one day be the master of his own shop. Rural journalists, intellectuals, spokespeople for immigrants, and others also united around the ideal of traditional success, offering their own models, all based on the yeoman.

Zenger, John Peter (1697–1746)

John Peter Zenger was a mildly successful, but constantly in debt, printer in New York. He was little known until he became involved in a struggle between rival city political factions that led to his arrest on a charge of criminal libel. His subsequent trial has become a part of American legend related to freedom of the press.

Zenger was born in the Rhine Valley of Germany in what is now Bavaria in 1697. His family immigrated to New York as part of a group of 3,000 Germans sent by England's Queen Anne in a scheme to produce naval stores for the English navy. As indentured servants, the immigrants were obligated to pledge seven years of service to their masters in return for freedom and a grant of land. The plans went awry, however, when many of the refugees, including Zenger's father, died in the harsh conditions of the transatlantic voyage. His mother, Johanna, was left with three children in a strange land with no means of support.

The young Zenger, age 13, attempted an apprenticeship with a cobbler that never took hold, and, in 1811, he was apprenticed to William Bradford, New York's most prominent printer. After eight years, upon completion of his contract, he married Mary White of Philadelphia and settled in Chestertown, Maryland. The marriage produced a son, John, but Mary died soon after, and Zenger moved back to New York. He married Anna Catherine Mulim on September 11, 1822. In 1825, he went into partnership with William Bradford, his former master, leaving the firm in 1826 to open a shop of his own on Smith Street.

New York politics in the 1720s and 1730s was a volatile affair, dominated by ambitious, even greedy, merchants, traders, bankers, and lawyers, who joined factions to compete for profits and government favors. The arrival of Governor William Cosby in 1632 added fuel to the political fires when he removed Lewis Morris as chief justice during a suit brought by Cosby against Rip Van Dam, who had served as interim governor before Cosby's arrival. Cosby wanted half of Van Dam's salary, but Morris sided with Van Dam's lawyers, James Alexander and William Smith. Cosby promptly removed Morris and appointed James Delancey to replace him on the bench.

Morris allied himself with Alexander and Smith and several other prominent New Yorkers to form the "Popular Party" in vocal opposition to the governor. They needed an outlet for their criticism of Cosby, but the existing newspaper and official paper of record in New York was Bradford's *New York Gazette*, and it was controlled by the governor and his supporters.

Morris and Alexander decided that they would start a newspaper. They approached Zenger, who had previously printed several broadsides for the People's Party. He agreed to print what would become the voice of political opposition, the *New York Weekly Journal*. Alexander became managing editor and chief writer, while his cohorts, Van Dam, Morris and others, provided much of the political content in columns, as well as letters to the editor, most of which soundly criticized Governor Cosby and his appointees, charging arrogance, graft, and corruption.

Zenger, a German immigrant with a limited education and a tradesman's understanding of the English language, probably understood little of the politically oriented screed that he printed. Nevertheless, the *New York Weekly Journal* became the first truly free press in the American colonies. It stood out from the usual fare delivered up by colonial newspapers, which were timid publications that reprinted news and stories from England and published government notices and official records, announcements of the arrivals and departures of merchant ships and their cargoes, and merchant's advertising.

Much of the prevailing understanding of freedom of the press was rooted in the ideas expressed in John Milton's *Areopagitica*. Published in 1644, it defended the idea that government must not enforce prior restraint upon publishers by way of licensing presses. This was Milton's appeal to Parliament to void the Licensing Order of June 16, 1643, requiring authors to submit their works to appointed government censors prior to publishing them.

The other popular view of press freedom was included in the ideas expressed in *Cato's Letters*, a series of essays published anonymously in England by Thomas Gordon and John Trenchard between 1720 and 1723. The essays established a compelling foundation for freedom of the press and speech by condemning both prior restraint, as well as subsequent prosecution of articles that criticized government authority. *Cato's Letters* were perhaps the most widely read and discussed series of publications in the colonies. These and Milton's work were undoubtedly major points of reference during Zenger's arrest and trial.

Alexander, as chief writer for the *New York Weekly Journal*, stated a philosophy of freedom of the press justifying the paper's attacks on the government. He explained that it was the duty of the press to act as a check on government actions and power, both exercised with legal impunity, by providing punishment with the "lash of satire" to those government officials who would not otherwise suffer punishment for their actions.

At first, the administration ignored the *New York Weekly Journal*, but as the rhetoric against Cosby increased, both in volume and sarcastic intensity, the governor sought a remedy. This resulted in a formal charge of seditious libel against Zenger, who, as printer of the newspaper, was legally responsible for the articles. Under common law, seditious libel was the serious criminal act of holding the king or his agents in the government up to public ridicule. Moreover, the truth of the libel could not be used as a defense at trial. The fact of the libel itself was proof of guilt.

Unable to convince a grand jury to indict Zenger, Cosby was able to convince the governor's council to respond to the political attacks. On November 6, 1734, the council ordered that four issues of the *New York Weekly Journal* be confiscated and publicly burned. Eleven days later, on November 17, 1734, Zenger was arrested and detained, pending a formal charge, which finally came down as "information" issued by Attorney General Richard Bradley in January 1735.

A formal charge by prosecutor's information was not unusual in the colonies. Fortunately for Zenger, the information contained the word "false" in its reference to the seditious statements. This would provide his attorney a basis for his defense later at trial.

Zenger was ably defended by Alexander and Smith, but they were soon disbarred in an unrelated dispute with the court. Alexander then retained Andrew Hamilton of Philadelphia, regarded by many as Pennsylvania's most accomplished defense attorney. Hamilton surprised the court at the opening of Zenger's trial, on August 4, 1735, by announcing that he was representing the accused.

The prosecutor's case was a simple explanation of the facts of the criminal libels. The printed pages were the evidence. Hamilton began his defense by admitting that Zenger had, in fact, printed the words, but he stated that Zenger had the right to print the truth. He eloquently argued that the decision of the jury, rather than that of a panel of judges, ought to decide this case. The prosecution reiterated that the admission of facts by Zenger proved his guilt, and argued that the law recognized that if the libels were true, the truth was an aggravation of Zenger's guilt because it brought even greater shame and public ridicule upon the governor. Hamilton countered that Zenger was free to print something as long as it was true.

Following closing arguments and Chief Justice Delancey's instructions that the fact of the libels were sufficient for a guilty finding, the jury retired "for a short time." It returned with a contrary verdict of not guilty. Zenger was released from custody the following day.

His acquittal caused an immediate sensation among the public at home, as well as in England. The case, however, established no legal precedent, as a jury's verdict does not change the law. Furthermore, the jury's decision was a clear case of jury nullification. The facts of the case, as well as established law, pointed to a finding of guilt, yet the jury disregarded both facts and law and found Zenger not guilty. The Zenger trial had little impact on law; however, it had great impact on the political views of American colonists. By and large, the colonists regarded the trial results as an eminently sensible and logical ingredient of basic freedom and a necessary means of holding the powers of government in check.

Within a short time after his trial, Zenger, capitalizing on political friendships, obtained government contracts to publish official notices. When Cosby died in 1736, the Popular Party formed by Alexander and Lewis disbanded, so there was no further need for a newspaper to broadcast their opposing viewpoints. The *New York Weekly Journal* became the newspaper of record for New York in 1737 and became, like most other colonial newspapers, a far cry from the critical voice of opposition that it was in 1734. Zenger died at age 49 in 1746. His wife Anna and son John continued publishing the *New York Weekly Journal* until 1751. Zenger eventually became known as the patron saint of American newspaper publishers.

There were no other major prosecutions of criminal libel brought during the remainder of the colonial period, with the notable exception of the William McDougall trial in 1770–1771, which ended with the death of the Crown's principal witness. Colonial legislatures, however, continued the practice of licensing colonial presses and punishing publishers for violating their contracts; thus, they applied both prior restraint and subsequent punishments to individual publishers for publishing information that reflected badly on legislators. Not until the establishment of speech and press freedom clauses in the first state constitutions and, subsequently, the establishment of the First Amendment guarantee of a free press in the Bill of Rights in 1791, did the concept of freedom of the press become widely recognized in the United States. Moreover, there is ample evidence that those state and national protections were aimed at prior restraint only and not at subsequent prosecutions.

Zuni

Situated just west of the continental divide, the town of Zuni sits on the banks of the Zuni River, a tributary of the Little Colorado. The Zuni's relative isolation from the rest of the Pueblo Indians and their unique colonial experience resulted in the development of a distinctive Zuni culture.

A highly secretive people, the Zuni's social, religious, and political system—with its connections to the kinship and clan systems—has defied interpretation by scholars since the nineteenth century. In the most general terms, Zuni society was matrilineal. With a backbone of religious and ceremonial organizations tied to kinship designations, it revolved around religious leaders, who acted as a unit, rather than as individuals.

European interaction with the Zuni began in violence. In 1539, the Zuni met and killed Esteban, a North African who had been a companion of Álvaro Núñez Cabeza de Vaca's ill-fated expedition. Esteban arrived at Zuni in advance of the expedition, which was headed by the Franciscan Fray (Father) Marcos de Niza. Fearing for his own safety, Marcos returned to Mexico without entering the city.

Despite the hostility of the Zuni, Marcos's reports prompted more Spanish exploration. When Francisco Vázquez de Coronado passed through Zuni on his return trip to Mexico in 1542, he left behind several Mexican Indians, who were still there when Antonio de Espejo visited the area forty years later.

Zuni contact with Europeans remained sporadic throughout the sixteenth century. When Juan de Oñate led an expedition into their territory in 1598, however, he was greeted warmly. Oñate's expedition soon left the Zuni, as Spanish colonization efforts focused on the Rio Grande Valley.

The first mission to the Zuni began in Hawikuh in 1629. By 1632, the church was built, and a new mission was opened in Hanola (present-day Zuni). The Pueblo Revolt expelled the Spanish in 1680, causing the Zuni missions to lose their friars. When Diego de Vargas reestablished Spanish control in 1692, he found that the Zuni had carefully guarded the ritual objects taken from the churches. Their behavior was the only instance of such action in the area.

At the time of the de Vargas expedition, the Zuni had abandoned five of their six towns and returned only to the town of Zuni. To some degree, the complex nature of Zuni society may be due to the consolidation of these previously autonomous towns.

After 1692, the Zuni saw no Spanish presence, as colonial effort again focused on the Rio Arriba. Unlike their neighbors in the Rio Grande Valley, the Zuni were not visited by secular Spaniards until 1700, when three exiles from Santa Fe entered the region with three new priests. The three settlers were

killed in 1703, apparently for aggressive behavior, thus ending the secular presence. These settlers constituted the last secular Spanish settlement in the Zuni area until Spanish-speaking communities were founded in the 1860s, about 30 miles to the east.

The Franciscan friars, however, continued their residence among the Zuni throughout the eighteenth century. Despite the friars' best effort, the Zuni proved a determined people, who protected their religious ceremonies with their lives; they often performed their ceremonies underground or outside of town, always beyond the prying eyes of their local padre. Finding the Zunis too resistant to their efforts, the Franciscans finally abandoned their missions in 1820. With the departure of the Franciscans, the Spanish presence among the Zuni people ended.

Despite the limited Spanish presence among them, the Zuni adapted some aspects of the colonizers' culture. Like other native peoples, the Zuni incorporated the introduction of these European ways into their own culture, myths, and legends. The heritage of nearly three centuries of Spanish contact included a few metal tools, agricultural products such as wheat, livestock such as sheep and goats, and a variety of concepts and practices that the Zuni altered to fit their belief structure, such as a secular government with parallel religious leadership.

Although the Spanish influence was minimal, it was significant. The Zuni constructed a complex and secretive society, which evolved, in part, in response to their contacts with the Spaniards, who had attempted to put an end to Zuni religious practices. The Spaniards had failed to realize that any change in the Zuni religion would amount to the end of the Zuni culture. While the Zuni developed a social system that incorporated elements of the colonizers' society, they still maintained the integrity of their own religious and cultural mores.

Arts, Culture, and Intellectual Life

1624

John Smith publishes *The Generall Historie of Virginia, New-England, and the Summer Isles*. The best known of all of his works, this contains the story of Smith's imprisonment by Powhatan and his subsequent rescue by Pocahontas, one of the most enduring legends in American history.

The period of Smith's literary productivity spans twenty-three years—from the earlier publication of *A True Relation of ... Virginia* (1608), to the publication of *Advertisements for the Unexperienced Planters of New England* (1631). As noted by Norman S. Grabo and Russel B. Nye in *American Thought and Writing, Volume I: The Colonial Period*, Smith's writings "form the first substantial body of literary work done in and about America."

1630

William Bradford begins writing *Of Plymouth Plantation*. Ostensibly a history of the Plymouth Colony, it is also intended to be a record of God's workings in the New World and an interpretation of God's divine plan for His Puritan saints.

Bradford will work on the manuscript until 1650, but he will never complete it. The manuscript will disappear at the time of the American Revolution, during the British occupation of Boston, and not surface again until 1855, when it will be found in the library of the Bishop of London. Bradford's work will be published the following year and returned to America in 1897.

1636

Harvard University is founded as Harvard College in Cambridge, Massachusetts.

1638

Stephen Daye and Elizabeth Glover establish the first printing press in North America in Cambridge, Massachusetts. In the first year of operation, the press produces the colonies' first two imprints. The first, *The Freeman's Oath*, is only one paragraph long; the second is *An Almanac Calculated for New England by Mr. Pierce, Mariner*.

Upon Glover's death in 1643, the press will become the property of Henry Dunster, her second husband and president of Harvard. Dunster will waste no time in allying the press closely with the college, and it will become the foundation for the publishing house known since 1913 as Harvard University Press.

1640

Elizabeth Glover's printing press produces *The Whole Booke of Psalmes Faithfully Translated into English Metre*, also known as *The Bay Psalm Book*. A collaborative translation of the Hebrew psalms of David by some of the most influential Puritans in the Massachusetts Bay Colony, *The Bay Psalm Book* provides an accurate, affordable, plainspoken alternative to the Sternhold-Hopkins Psalter of 1562, the psalm book most commonly used by the Plymouth Colony Pilgrims and the English Puritans.

The Bay Psalm Book is the first book to be both written and printed in North America. It also is one of the three most commonly owned books in seventeenth-century New England—the Bible and *The New England Primer* (1690) being the other two.

1641

In Boston, William Read paints the first colonial portrait. The subject of the portrait is the governor of Massachusetts, Richard Bellingham.

1650

The Tenth Muse Lately Sprung Up in America; or Several Poems Compiled with Great Variety and Wit, etc., by Anne Bradstreet, is taken to England by Bradstreet's brother-in-law, Reverend John Woodbridge, and published without her knowledge or consent. *The Tenth Muse* is the first book of poetry published by anyone, man or woman, living in the colonies of British North America. The poems in this collection are linguistically and rhetorically accomplished; they are, however, for the most part, conventional and derivative, more products of Bradstreet's poetic influences than they are of her individual poetic voice.

A second, revised edition of *The Tenth Muse*, titled *Several Poems Compiled with Great Variety of Wit and Learning, Full of Delight*, will be published in 1678, six years after the author's death. As Pattie Cowell comments in her essay on Bradstreet, which appears in the fourth edition of *The Heath Anthology of American Literature*, edited by Paul Lauter, "this later work ... develops from the conventional public verse of the first edition to more private themes of family, love, nature, sorrow, faith, and resignation."

1662

The Reverend Michael Wigglesworth, minister to the town of Malden, Massachusetts, publishes *The Day of Doom; or, A Poetical Description of the Great and Last Judgment*. Inspired by a dream he had ten days after the death of his father, *The Day of Doom* is an epic poem in which Wigglesworth describes Judgment Day in vivid detail and illustrates the urgent need for repentance, as well as the promise of redemption. The poem is an instant best-seller; the entire press run of the first edition (1,800 copies) is sold out within the year.

As popular and accomplished as it is, *The Day of Doom* is not Wigglesworth's only poetic achievement; indeed, it is not even his only best-seller. His next work, *Meat Out of the Eater or Meditations Concerning the Necessity, End, and Usefulness of Afflictions unto God's Children, etc.* (1669), will fall just shy of equaling *The Day of Doom's* success and popularity.

1665

The first play performed in North America, *The Bare and the Cubb*, by William Darby, is presented in Accomac County, Virginia. The play shocks local residents; one in particular, a man named Edward Martin, files a charge of public wickedness against Darby, Cornelius Watkinson, and Philip Howard, the three men responsible for the play's production. So that their innocence or guilt can be properly determined, the accused are ordered to perform the play, in full costume, before the local magistrate. The magistrate, seeing nothing untoward in the performance, dismisses all charges against the three men and orders their accuser to pay the court costs.

1670

In Boston, John Foster creates the first art print ever produced in colonial America. As David Bjelajac demonstrates in *American Art: A Cultural History*, the print is done in a straightforward, unadorned style that mirrors the reputed preaching style of its subject. The woodcut depicts the Reverend Richard Mather, dressed in the stark black raiment of the scholarly divine, holding a small pair of reading glasses and pointing to a book he holds open in his left hand. The woodcut is created a year after Reverend Mather's death, possibly as a frontispiece to a biography written by his son, Increase Mather.

John Foster will go on to construct Boston's first press in 1675 and to produce, in 1677, *A Map of New England*, the first map ever printed in America.

1682

Edward Taylor, minister to the town of Westfield, Massachusetts, and one of colonial America's greatest poets, begins composing *Preparatory Meditations Before My Approach to the Lord's Supper*. As Alan Shucard explains in *American Poetry: The Puritans Through Walt Whitman*, Taylor composed these meditations on human depravity, God's goodness and mercy, and the hope for God's grace "every other month for 43 years [as a way] to prepare himself spiritually for the next Lord's Supper, or Eucharist."

Although his most remarkable achievement, *Preparatory Meditations* is not Taylor's only contribution to American poetry. In addition to writing *God's Determinations Touching His Elect: and the Elects Combat in Their Conversion, and Coming Up to God in Christ Together with the Comfortable Effects Thereof* (c. 1685), he also will compose love poems, elegies, Biblical paraphrases, meditations, lyrics, and the 20,000-line *Metrical History of Christianity*.

Mary White Rowlandson publishes *The Sovereignty and Goodness of God, Together with the Faithfulness of His Promises Displayed; Being a Narrative of the Captivity and Restauration of Mrs. Mary Rowlandson*. A detailed account of her abduction by, her treatment at the hands of, and her eventual release from a band of Algonquin natives during King Philip's War, the book is one of the earliest best-sellers written in North America and the first one written by a woman. In the first year alone, Rowlandson's *Narrative* goes through four printings. Along with John Smith's story of his capture and imprisonment by

Powhatan and his subsequent rescue by Pocahontas, Rowlandson's *Narrative* is one of the most important contributions to the American genre of the captivity narrative.

1684

An issue of the *London Gazette* is reprinted in Boston, marking the first time a newspaper is produced in America.

1690

The New England Primer is published in Boston. Part reader, part spelling book, part religious/historical text, it combines literacy with moral and religious instruction in an attempt to provide young Puritans with the tools necessary to ensure the continued viability of their individual spiritual lives—and, by extension, the continued viability of the spiritual life of the community—while simultaneously placing that individuality in the context of culturally sanctioned behavior. *The New England Primer* is hugely popular, and it will sell nearly 5 million copies by 1830.

In Boston, Benjamin Harris prints *Publick Occurrences*. This would have been the first monthly news publication printed in colonial America. Unfortunately, Harris fails to acquire the proper licenses, and publication of *Publick Occurrences* is halted after only one issue.

1693

The College of William and Mary is founded.

1695

Dinah Nuthead, upon the death of her husband, William, assumes control of the printing press he had established in St. Mary's, Maryland, ten years earlier. She becomes North America's first female printer. (Although Elizabeth Glover was the first woman to establish a printing press in North America, her son and her late husband's apprentice handled the press's day-to-day operation. Dinah Nuthead was the first woman in North America who actually set the type and ran the press herself.)

1701

Yale University is founded as the Collegiate School of Connecticut.

1702

Cotton Mather publishes *Magnalia Christi Americana; or The Ecclesiastical History of New England from its First Planting*, the most celebrated of his more than 400 published works. The *Magnalia* contains a history of New England, biographies of various colonial authorities and Puritan divines, a history of Harvard College, descriptions of the state of the churches, accounts of providential occurrences, and descriptions of the "Wars of the Lord."

1704

John Campbell, postmaster of Boston, begins publishing the *Boston News-Letter*, North America's first newspaper published on a regular basis. Since his readers are more interested in European news and gossip than they are in what is happening in the colonies, Campbell dedicates the *Boston News-Letter* primarily to goings-on overseas.

1707

Robert Feke, the first great native-born American painter and the first painter to evolve a uniquely American style of painting, is born in Oyster Bay, Long Island. Unlike more traditional artists such as John Smibert, who received formal artistic training in Europe, Feke will rely on instinct, intuition, and natural ability to compose his paintings, not on any formal artistic theory. As a result, his paintings will be endowed with a realism and clarity that is lacking in Smibert's work, and Feke's paintings will become more popular with the colonists, who are, themselves, unschooled in the particulars of art and art history.

In 1741, Feke will paint his masterpiece, *Isaac Royall and His Family*. The painting will bear a striking resemblance to Smibert's *The Bermuda Group—Dean George Berkeley and His Family*, and it will be obvious that Feke used it as a model for his own work.

1708

Henrietta Dering Johnston emigrates with her husband from Ireland to South Carolina. Johnston is the first female painter to work in the North American colonies. She is also the first American pastelist.

1710–1735

A small group of Hudson Valley artists known as the Patroon Painters—so-called because they make their livings painting the portraits of New York's wealthy, upper-class landowners, or "patroons"—ply their talents from New York City to Albany. The Patroon Painters are native-born American artists, who have neither the luxury of formal artistic training nor the benefit of any great masters with whom study is possible. Instead, they rely for inspiration and instruction on mezzotints imported from England; as a result, most of the paintings attributed to the Patroon Painters are little more than local versions of European originals.

1714

The first play printed in North America is published. Written by Robert Hunter, the governor of New York, *Androboros; A Biographical Farce in Three Acts*, is a satire in the tradition of Jonathan Swift. In *Androboros*, Hunter lampoons the machinations of colonial politics, ridicules New York's local government, and mocks his political adversaries.

Some of Hunter's most biting satire is reserved for the play's title character, Androboros, a treacherous rabble-rouser, who ends up falling victim to the very trap by which he intends to ensnare the Keeper. The Keeper is a barely disguised depiction of Governor Hunter himself, while Androboros is a thinly disguised portrait of Francis Nicholson, one of Hunter's most reviled enemies. The play is never produced.

1716

William Levingston, a successful merchant, builds the first American playhouse on the Palace Green in Williamsburg, Virginia. His indentured servants, Charles and Mary Stagg, help him in this venture; in addition to being Levingston's servants, they are also actors and dancing masters.

Plays are performed here until the playhouse eventually falls into a state of neglect and is converted into a town hall in 1745.

1719

William Brooker succeeds James Campbell as postmaster of Boston and begins publishing the *Boston Gazette*, the second regularly published newspaper established in British North America. Almost identical to the *Boston News-Letter* in both style and content, the founding of the *Boston Gazette* creates America's first competitive newspaper market.

1721

The first music textbook printed in North America, *A Very Plain and Easy Introduction to the Whole Art of Singing Psalm Tunes*, is published in Massachusetts by Reverend John Tufts. By 1682, with those who could read music firmly in the minority, the practice of psalm singing in the colonies lacked even a modicum of regularity and had become, in many places, a cacophonous, ear-splitting din. Tufts's *Introduction*, it is hoped, will restore a degree of musical literacy to the colonies; the textbook also is intended to put an end to the musical butchery caused by "lining out." This system of psalm singing is described by Thomas L. Purvis in *Colonial America to 1763* as that by which a precentor "who [is] typically a church elder, [sings] a psalm line by line, with pauses in between each that [allow] the congregation to repeat the stanza in his meter and melody."

After losing the printing contract for William Brooker's *Boston Gazette*, Benjamin Franklin's brother, James, begins publishing *The New England Courant*, the third regularly produced newspaper established in the American colonies. Unlike the stiff and torpid reporting that characterizes the *Boston News-Letter* and the *Boston Gazette*, the *New England Courant* is designed to entertain, amuse, and stimulate readers. Benjamin Franklin, writing under the pseudonym of Silence Dogwood, frequently contributes satirical essays to the *Courant*, and he will briefly assume the paper's editorship, when his brother is jailed on contempt charges in 1722.

1727

Now in Philadelphia, Benjamin Franklin establishes the Junto, a combination intellectual society and mutual improvement club. According to the rules Franklin drafts to govern the society, meetings are to be held every Friday evening, and members are required to arrive at those meetings prepared to discuss and debate the moral, political, and philosophical questions that had been posed at the previous week's meeting and to raise new questions for discussion the following week. Members are also required to write and present an original essay on a topic of their choosing once every three months. Franklin's Junto remains active for forty years, longer than any other colonial American society of its kind.

North America's first circulating library—the Philadelphia Library Company, established by Franklin in 1731—will be a direct result of the Junto. In 1743, the Junto also will become the foundation upon which Franklin will build the American Philosophical Society, North America's first scientific association.

1728

Peter Pelham's portrait of Cotton Mather is the first mezzotint produced in North America.

1729

William Burgis creates *The Boston Lighthouse*, North America's first maritime print. It depicts a British ship anchored near the first colonial lighthouse.

Scottish-born John Smibert, the first professional artist to achieve success in America, opens a studio/art gallery in Boston. A member of the group led by Dean George Berkeley to establish a college in Bermuda, Smibert decides to stay in the colonies after the group receives word that Parliament has cut off the college's funding. It is for *The Bermuda Group—Dean George Berkeley and His Family*, the painting of those involved in the ill-fated project for which Smibert is best known.

One year later, Smibert will hold an art exhibition in his Boston studio that will be the first such exhibit ever held in America. He will retire in 1746, after having completed more than 250 portraits.

1732

Benjamin Franklin first publishes *Poor Richard's Almanack* under the pseudonym Richard Saunders. Richard Saunders is more than just a pseudonym, however; he is a persona. The adages attributed to this fictional henpecked stargazer—such proverbs as "It is hard for an empty sack to stand upright," and "Keep thy shop, and thy shop will keep thee" that Franklin intersperses among the usual weather forecasts and important dates—are what makes

Franklin's almanacs more popular than any others published in the colonies. By Franklin's own account, *Poor Richard's Almanack* will sell an average of 10,000 copies a year over the next twenty-five years.

1735

Flora, or Hob in the Well, the first opera performed in North America, is presented in the courthouse in Charles Town, South Carolina, as is the Thomas Otway tragedy, *The Orphan*. So successful are these performances, a theater will be constructed in 1736 to better accommodate the audiences; unfortunately, the New Theatre in Dock Street lasts only four years, burning down in 1740.

Gustavus Hesselius, a Swedish-born artist who has been living in colonial North America since 1711, paints the portraits of two Lenni Lenape (Delaware) chieftains, Lapowinsa and Tishcohan. As Wayne Craven states in *American Art: History and Culture*, these portraits are "the first lifesize [sic], bustlength [sic] images of Native Americans painted by a white artist in colonial America."

1738

John Singleton Copley, the greatest native-born colonial American painter, is born in Boston. As a portraitist, Copley is unsurpassed. He has the ability to idealize his subject's features without sacrificing the person's individuality, as well as to render a truthful representation of the person without the result being coarse or unpleasant. It is this ability to strike a delicate balance between the ideal and the real that makes him, by 1766, one of the most sought-after portraitists in colonial America.

In 1765, *Boy with a Squirrel*, Copley's portrait of his stepbrother, Henry Pelham, introduces his work to an admiring international audience, when it is entered in the annual exhibition of the Society of Artists in London.

1741

North America's first two magazines appear in Philadelphia. The first, Andrew Bradford's *American Magazine, or A Monthly View of the Political State of the British Colonies*, makes its debut on February 13; Benjamin Franklin's *General Magazine, and Historical Chronicle, For All the British Plantations in America* appears three days later. Both magazines rely heavily on their British predecessors and counterparts for inspiration, and both are primarily concerned with political issues.

At least half of the *American Magazine's* total page count is devoted to news of the proceedings of various colonial assemblies, with articles on such topics as colonial history, foreign politics, money, religion, and the weather accounting for the other half. By contrast, political news comprises only one-third of Franklin's *General Magazine*; the remaining space is devoted to articles on religion and finance, as well as to such things as historical sketches, poetry, dialogues, and current events. The *American Magazine* lasts for only three issues; the *General Magazine* lasts for six.

1745

Dr. Alexander Hamilton (not to be confused with the Alexander Hamilton who served as George Washington's Secretary of the Treasury) founds the Ancient and Honorable Tuesday Club in Annapolis, Maryland. The club functions as a kind of cultural training ground, a place where affluent and would-be affluent members of colonial American society go to learn how to behave like sophisticates. Club members discuss all things of cultural interest, from literature and painting to architecture and musical compositions.

Robert Feke paints a portrait of Brigadier General Samuel Waldo to commemorate the role Waldo played in the New England militia's victory over the French at Louisbourg, Nova Scotia. Feke's portrait of Waldo is one of the first three paintings done in North America explicitly to commemorate the deeds of great men. The other two portraits, both done by John Smibert, are of Sir William Pepperrell and Sir Peter Warren, both of whom, along with Waldo, led the Louisbourg campaign.

1746

Princeton University is founded as the College of New Jersey.

1749

The first professional American theater company begins performing European plays in Philadelphia. Headed by Walter Murray and Thomas Kean, the troupe moves to New York City in 1750, where they perform at the First Nassau Street Theatre until 1751. From New York, the company moves south, performing in Williamsburg and various other towns in Virginia and Maryland. Unable to compete with the theatrical company led by Lewis Hallam, the Murray-Kean troupe dissolves shortly after Hallam's arrival in the colonies in 1752.

Benjamin Franklin publishes *Proposals Relating to the Education of Youth in Pensilvania*. In this pamphlet, he asserts the importance of education to both familial and communal well being, laments that Pennsylvania does not possess a college or academy for the education of its youth, argues for the necessity of establishing such an institution, and suggests a curriculum.

Franklin's *Proposals* will lead to the establishment of the Philadelphia Academy in 1751. In 1755, the Philadelphia Academy will become the College of Philadelphia; in 1791, the school will become known as the University of Pennsylvania.

1754

Columbia University is founded as King's College in New York City.

Jonathan Edwards publishes *A Careful and Strict Enquiry into the Modern Prevailing Notions of that Freedom of the Will, Which is Supposed to be*

Essential to ... Praise and Blame, his masterwork. In *Freedom of the Will*, Edwards argues that the nature of the human will is of the utmost importance, because people are not predisposed to either good or evil deeds, even though they are born already in a fallen state. According to Edwards, human beings do not possess free will but are, nonetheless, free to do that which their wills allow. It is this freedom, and no other, that has been granted to the human race. *Freedom of the Will* is hailed immediately as a major philosophical treatise, and it is adopted as a textbook by several colleges, including Yale, Edwards's alma mater.

1755

Thomas Johnston produces *A Prospective Plan of the Battle Fought Near Lake George on the 8th of September 1755*, the first engraving of a historical event ever produced in America.

1762

The St. Cecilia Society, the first organization in North America devoted entirely to secular music, is formed in Charles Town, South Carolina. The society is composed primarily of amateur performers, though professional musicians are also engaged on a seasonal basis. The society will regularly offer concerts until its dissolution in 1912.

1764

Brown University is founded as the College of Rhode Island.

Two plays dealing explicitly with the circumstances of the Paxton Rebellion are published anonymously. In December 1763, angered by concessions made to Native Americans and by the inability of the colonial authorities to protect them and safeguard their interests, a group of fifty settlers, known as the Paxton Boys, from Pennsylvania's western provinces, had attacked the peaceful native village of Conestoga and slaughtered the inhabitants. The following January, when colonial authorities attempted to arrest those responsible, the Paxton Boys were joined by 550 of their fellow frontiersmen in a march on Philadelphia. Only Benjamin Franklin's skillful negotiations with the leader of the rebels, Lazarus Stewart, averted a murderous disaster.

Both plays about these events, *The Paxton Boys* and *A Dialogue, Containing Some Reflections on the Late Declaration and Remonstrance, of the Back-Inhabitants of the Province of Pennsylvania*, treat the Paxton Rebellion with derision and contempt and encourage American settlers to remain loyal to the British Crown. The rebels, as well as those colonists who are sympathetic to their cause, are portrayed as cowardly and treacherous, while good citizens are shown to be those men and women who are still loyal British subjects. *The Paxton Boys* is the first American play to feature Native Americans as characters.

1766

Rutgers University is founded as Queen's College in New Brunswick, New Jersey.

The Southwark Theatre, North America's first permanent theater, opens in Philadelphia.

Major Robert Rogers publishes *Ponteach, or the Savages of America*, the first American play to feature a Native American as the leading character and the first play written with a uniquely American theme. While Rogers in *Ponteach* (pronounced Pontiac) presents Native Americans as noble, benevolent human beings, whose rebellions against the British are justified, he depicts his fellow colonists as cruel, greedy, amoral thugs. The traders cheat the native peoples and get them drunk, the hunters kill them for amusement, the military is completely indifferent to their plight, and the colonial authorities steal from them. Rogers even portrays members of the clergy as being rapacious and conniving in their dealings with the indigenous peoples of North America.

It is this pro-native/anti-British colonial slant that marks *Ponteach* as a significant ideological shift in American playwriting. By finding fault with the manner in which the indigenous peoples are treated by the British and by suggesting that their rebellion is understandable, perhaps even defensible, Rogers, a former major in the British army, is the first colonial playwright even to imply that any kind of rebellious behavior against the British government might be justified. *Ponteach* is never performed.

1767

David Douglass's American Company presents *The Prince of Parthia* at the Southwark Theatre in Philadelphia. Written by Thomas Godfrey, Jr., *The Prince of Parthia* is the first play written by a native-born American playwright ever to be performed on the American stage by a professional theater company. It is the story of an evil prince (Vardanes) who convinces his father (King Artabanus) to imprison his brother (Arsaces) because he resents his brother's skill on the battlefield and because his brother has won the love of a woman (Evanthe) for whom both he and his father lust. A third brother (Gotarzes) learns of the plot and attempts to free Arsaces; although he is successful, word that Arsaces has been killed reaches Evanthe, and she kills herself. Unable to live without her, Arsaces, too, commits suicide, leaving Gotarzes to pick up the pieces. Hopelessly tedious and dull in the extreme, the play is performed only once.

Thomas Forrest (under the pseudonym Andrew Barton) writes *The Disappointment, or the Force of Credulity*, the first comic opera composed in North America. As George O. Seilhamer explains in *History of the American Theatre: Before the Revolution*, *The Disappointment* satirizes the popular colonial belief that Blackbeard (Edward Teach) hid his pirate booty on the banks of the Delaware River, near Cooper's Point, and that he killed a prisoner and buried him with the loot so that the man's ghost would guard the area and frighten away treasure hunters. Consequently, any report of anything even remotely supernatural happening in the vicinity of Cooper's Point is enough to get the superstitious and the gullible running for two things: their shovels and someone with a knowledge of the black arts, who can help them find the exact spot where the treasure is buried and cast a spell of protection around the area to ward off the angry ghost.

The existence of such a colorful myth, along with the presence of such unbelievably gullible people, is fertile soil, indeed, for the playing of practical jokes. It is one of these jokes, played by Forrest himself on his tailor and a printer named Ambruster, that supplies the play's subject matter. Though the first performance of *The Disappointment* is scheduled to take place at Philadelphia's Southwark Theatre on April 20, the performance is canceled and never rescheduled. In fact, the play is never produced. It does, however, mark the first appearance of an Irish character in an American drama.

1769

Dartmouth College is founded in Hanover, New Hampshire.

1771

Benjamin Franklin begins work on his *Autobiography*. The most important and influential of his many and varied literary compositions, the *Autobiography* is divided into three sections. As David M. Larson notes in his essay on Franklin, which appears in the fourth edition of Paul Lauter's *Heath Anthology of American Literature*, "the first section tells the story of Franklin's youth and young manhood in Boston and Philadelphia, viewing the protagonist, the young Franklin, as though he were a character in a novel.... The second section ... recounts Franklin's youthful attempt to achieve moral perfection [and] the third section ... portrays the adult Franklin's use of the principles of conduct that he discovered in the first section and enumerated in the second [and] focuses on his rise to prosperity, his scientific studies, and ... his work as philanthropist and politician." Franklin will work on his *Autobiography* until 1788, but he will never actually complete it.

1772

Mercy Otis Warren, the most prolific writer of pro-American independence propaganda plays, publishes *The Adulateur: A Tragedy as it is Now Acted in Upper Servia*. It is the first of her three dramas that satirize colonists still loyal to the British Crown and portray British officials as greedy, dishonest hypocrites; *The Defeat* (1773) and *The Group* (1775) are the other two.

Mrs. Warren is particularly fond of lampooning the governor of Massachusetts, Thomas Hutchinson, who is not only perceived to be a treacherous British loyalist, but is also the man the patriots blame for the Boston Massacre and the Boston Tea Party. In both *The Adulateur* and *The Defeat*, Hutchinson is portrayed as a despicable traitor, who will do anything for money and power and who has no love or concern for the common people.

By the time *The Group* is published, Hutchinson has been called back to England, so Warren is forced to find other targets for her vicious wit. As it happens, Hutchinson's brother and father-in-law are still very much on the political scene, and she attacks them with as much vehemence as she did their unfortunate relative. Two weeks after *The Group* is published in Boston, the Revolutionary War begins. As S. E. Wilmer points out in *Theatre, Society and the Nation: Staging American Identities*, it is a war the play both predicts and encourages.

1773

Phillis Wheatley publishes *Poems on Various Subjects, Religious and Moral*, the first book ever published by an African American. Published in London, this collection of thirty-nine poems is Wheatley's second volume of poetry. In 1772, she tried to publish a volume containing twenty-eight poems on such topics as morality, piety, American patriotism, and race (her poem "Thoughts on Being Brought from Africa to America" was to have appeared in that volume), but she failed to secure the number of subscribers necessary for publication. Her third volume of poetry, which will contain thirty-three poems and thirteen letters, will meet a similar fate in 1779. The first American edition of *Poems on Various Subjects, Religious and Moral* will appear in Philadelphia in 1786, two years after Wheatley's death.

Jay Hopler

Economy, Business, and Labor

1497

An Italian sea captain in English service, John Cabot (Giovanni Caboto), discovers cod fisheries off the coast of America. The news spreads rapidly in Europe.

1501

King Henry VII of England grants a monopoly of American trade to some Bristol and Portuguese merchants.

1512

The Spanish government gives a charter to Juan Ponce de León's expedition authorizing the taking of Native American slaves.

1521

A Spanish slave-raiding party lands in present-day South Carolina, kidnapping natives to work in the Caribbean.

1543

The Spanish government ineffectively bans enslavement of Native Americans in its New World possessions.

1562

The English captain John Hawkins lands in West Africa to take on a cargo of slaves destined for the Spanish colonies in America. This is the first English slave-trading voyage. British involvement in the African slave trade will be marginal until the 1640s.

1573

The Spanish Crown issues the "Orders for New Discoveries." These orders establish the legal regime under which New Mexico will be colonized; they envision an economy based on *encomiendas* (grants of land and local rule), as well as exacting tribute from Native Americans.

1576–1578

The English sailor Martin Frobisher makes his first voyage to the Arctic in 1576 in search of the Northwest Passage. He returns with what he believes is gold ore.

In 1577, Frobisher makes a second voyage to the Arctic. In addition to more "gold ore," his return cargo includes enslaved Inuits, who die shortly after arriving in England. The following year, Frobisher sails once more to the Arctic; however, his "treasure" is revealed to be worthless iron pyrite, or fool's gold.

1582

The Spanish government sends African slaves to work in St. Augustine, Florida.

1586

Returned Virginia colonists introduce tobacco smoking to English society. (Previously, only sailors had smoked tobacco.)

1606

The Virginia Company is chartered by James I.

1607–1608

The English colony of Jamestown is founded in 1607. The following year, a glassworks is built at the colony.

1612

John Rolfe introduces the cultivation of mild, "Spanish" tobacco with seeds smuggled from the Caribbean to Jamestown. This tobacco will prove far more valuable as an export than the harsher local variety, and it will become the foundation of the Chesapeake tobacco trade.

1614

A group of Amsterdam merchants, organized as the New Netherland Company, receives a charter from the States-General of the Dutch Republic granting a monopoly for four fur-trading voyages to the recently explored area of the Hudson River. The profitable venture, which includes the establishment of a permanent trading post at Fort Nassau (south of present-day Albany), increases interest in the area among Dutch merchants.

The Spanish king, Philip III, requires, on pain of death, that all Spanish colonial export tobacco be shipped to Seville. The problems this creates for the Spanish tobacco trade help open the door for exports from the Chesapeake.

The earliest exports of tobacco from Virginia are recorded.

The first saltworks in the British American colonies is established in Virginia.

1619

The first slave ship to arrive in British North America lands at Jamestown. The Dutch vessel sells twenty African slaves to the colonists, who treat the slaves similarly to indentured servants.

1620

The first tannery in the British North American colonies is founded at Jamestown.

1621

The Dutch government charters the West India Company to control trade with West Africa and the Americas.

1622

Native American attacks on the Virginia colony destroy early Virginia industries. Virginia's trade will now be based almost entirely on tobacco.

1624

The Virginia Company's charter is revoked.

King James I of England establishes a royal tobacco monopoly.

1626

Eleven slaves arrive in the first importation of slaves into New Netherland.

1628

The New England Company is organized.

1629

To encourage colonization, the Dutch West India Company sells patroonships, combining quasi-feudal rights over large territories with the right to trade fur, fish, and other commodities.

The New England Company sends six shipwrights to Salem to build fishing vessels. This is the beginning of commercial shipbuilding in New England.

1632

In Paris, Father Gabriel Sagard, a missionary of the Recollect order, publishes an account of his journeys among the Huron. To encourage investment in the area by French businessmen, he describes the copper mines of the Lake Superior region, although he does not claim to have seen them himself.

1638

By early October, the first printing business in British America is in operation in Cambridge, Massachusetts.

The first large-scale American textile business is founded at Rowley, Massachusetts.

1643

John Winthrop, Jr., then visiting England, creates a Company of Undertakers of the Iron Works in New England. Winthrop returns to the Massachusetts Bay Colony with financial backing, materials, and a company of skilled workers.

1644

Construction begins on a blast furnace for smelting iron ore in Braintree, Massachusetts. The General Court of Massachusetts issues Winthrop a monopoly on iron manufacture.

1645

The Jesuit missionary Father Lallemant learns of the salt springs of the Onondaga people in what is now upstate New York.

1646

The first American mechanical patent is issued by the Massachusetts Bay Colony to Joseph Jenks. It gives him exclusive rights for fourteen years to his improvements in sawmills and scythes.

1647

The first known export (from Massachusetts to the West Indies) of live horses from the British American colonies occurs.

1650

The Iroquois, whose principal European trading partners are the Dutch, are victorious over the French-allied Huron in the so-called Beaver Wars. This establishes them as the dominant Native American force in the fur trade, forcing French-Canadian fur traders farther west.

1651

The English Parliament's First Navigation Act requires that all goods imported into England be carried in English vessels. The principal target of this legislation is the Netherlands.

1652

The Massachusetts General Court votes to establish a mint in Boston; it also incorporates a company to provide water to the city.

1653

The Royal Navy begins buying masts for its ships in New England.

1660

A new navigation act passed by the British Parliament requires that all goods imported or exported from the colonies must be carried in British or colonial vessels. It also mandates that sailors and merchants be English and requires the colonists to export some goods—such as sugar, tobacco, and wool—only within the British Empire.

The Royal Company of Adventurers into Africa, a British group involved in the slave trade and other African trades, is chartered.

1662

A modification to the Navigation Act requires that merchant vessels be built within the British Empire to avoid paying duties.

1663

Governor William Berkeley of Virginia publishes *Discourse and View of Virginia*, advocating that the colony develop a more diverse economy with less reliance on tobacco.

The Staple Act requires that most products destined for the colonies that are produced in Europe (outside Britain) first pass through England to be loaded onto ships from Britain or the colonies.

The Royal Company of Adventurers into Africa receives a new charter. Unlike the 1660 document, it specifically mentions the slave trade. The company is unsuccessful in breaking into the Dutch-dominated market.

1667

Much of the Virginia tobacco fleet is seized by the Dutch, who are at war with the British.

1670

The Hudson's Bay Company is founded.

1672

The Royal African Company, an English slave-trading group, is established. Unlike previous groups, it is dominated by businessmen rather than courtiers, and it will prove to be more successful.

1673

Still at war with Britain, a Dutch fleet seizes half of the Virginia tobacco fleet and scatters much of the rest. The Dutch also shut down the Newfoundland fishing ground.

The British government imposes duties on goods shipped between colonies.

Jesuit missionaries Louis Jolliet and Jacques Marquette discover coal deposits in the Illinois region.

1675

The Governor and Council of New York charter a joint-stock company, the New York Fishing Company, for developing the regional fishing industry.

1676

At a Quaker meeting in Rhode Island, William Edmundson attacks slavery. His speech is the first known Quaker protest against slavery in America.

1677

In New England, the British colonists' victory in King Philip's War is followed by enslavement of many of the surviving natives.

1680

The Pueblo revolt in New Mexico destroys the *encomienda* system and leads Spanish authorities to decrease their use of forced native labor.

1682

William Penn, governor of the new colony of Pennsylvania, charts a joint-stock company, the Free Society of Traders in Pennsylvania, with substantial endowments of land. Although the society eventually erects factories and mills on some of its land, it proves to be a failure.

1684

The French government orders its Canadian colony to send Iroquois prisoners to France to serve as galley slaves. This is the only known case of a European government demanding Native American slaves for labor in Europe.

1685

The governor of New York licenses Captain Johannes Rosenboom to trade with the western New York Native Americans; this is in defiance of French claims over the area.

1688

The Boston mint is closed by order of the English government.

The first large colonial pottery works is set up at Burlington, New Jersey, by the governor, Daniel Coxe. The effort is short-lived.

1690

William Rittenhouse and William Bradford construct the first paper mill in the colonies at Germantown, Pennsylvania.

This year also marks the approximate beginning of large-scale cultivation of rice for export in South Carolina.

1692

Arnout Viele, a Dutchman in English service, makes the first fur-trading expedition from Albany to Native American settlements in the Ohio Valley.

1693

Jesuits in French North America petition the governor of Canada to halt the trade in enslaved natives, which they claim hinders efforts at conversion. The governor accedes to their request, but the new prohibition is initially ineffective.

1696

The Board of Trade, a department of the British government to oversee trade with the colonies, is founded.

A parliamentary act establishes vice-admiralty courts in America.

The first known slave to be imported directly from Africa arrives in South Carolina.

South Carolina enacts an extensive slave code modeled on Barbadian slave law.

1697

Massachusetts fixes the value of the Spanish dollar at six shillings. Spanish dollars are widely used throughout the colonies as currency.

1698

A parliamentary act ends the Royal African Company's monopoly on the African slave trade.

To combat smuggling, the British government requires that tobacco imports be in hogsheads rather than shipped loose in bulk.

1699

To protect markets for English-made woolen goods, British law forbids the export of raw wool, yarn, or fabric from the colonies to England. The law also forbids the use of a horse, cart, or carriage to move these goods from one colony to another.

1700

The Massachusetts judge Samuel Sewall, involved in a legal case over a slave promised freedom by his master, publishes *The Selling of Joseph*, one of the first American tracts against slavery. Sewall stops short of advocating abolition, instead calling for the end of slave importations from Africa.

The Pennsylvania Money Act values a Spanish dollar at nearly eight shillings, hoping to attract specie.

1702

The first evidence appears of London-style coffeehouses—the Pennsylvania, Carolina, and New England Coffee Houses—devoted to meetings of foreign

traders with North American colonists.

1704

The Board of Trade, accepting the Massachusetts valuation, fixes the value of the Spanish dollar in the colonies at six shillings. This is known as the proclamation rate and is ignored in some of the colonies.

Former South Carolina governor James Moore, with the backing of the South Carolina Assembly, invades Spanish Florida with a private army of Englishmen and Creek Indians, taking thousands of Native American slaves, mostly women and children.

1705

The first copper mine in British America is opened near Simsbury, Connecticut.

The Virginia Slave Code incorporates a number of previous laws relating to slavery and establishes that conversion to Christianity does not free a slave.

Parliament's new bounties on such naval stores as tar, pitch, and turpentine lead to a rapid expansion of this industry in the pine-rich Carolinas. The Carolinas soon surpass New England as the leading producer of naval stores.

1706

The growth of the South Carolina rice industry leads Parliament to add rice to those commodities that colonies are forbidden to export outside of the British Empire.

1707

The Act of Union between England and Scotland opens up Britain's American colonies to Scottish trade and emigration.

1708

Valuation of the Spanish dollar in the colonies at six shillings is confirmed by parliamentary statute.

1710

Work begins on a new, 1,600-foot wharf in Boston's harbor. It will be completed in 1713.

1711

A force of Creeks, Chickasaws, and South Carolinians invades the Choctaw country, capturing and enslaving several hundred Choctaws.

1712

Captain Christopher Hussey of Nantucket locates schools of sperm whales in the North Atlantic, a discovery that begins the deep-sea sperm whale trade.

The French government hands over control of Louisiana to a private trading company headed by the financier Antoine Crozat.

A slave uprising in New York City results in the death of ten white colonists and the burning of many buildings. After the uprising is suppressed, nineteen insurgents are executed.

1713

Following the War of the Spanish Succession, Britain receives the *asiento*, the right to import slaves into Spanish America.

Copper is discovered on the Schuyler estate in New Jersey. One of America's most productive copper mines will be sited there.

1714

The succession of the Hanoverian ruler George I to the British throne leads to hostility between Great Britain and Sweden, which is at war with Hanover. This increases British demand for colonial iron and naval stores, products previously imported from Sweden.

The Land-Bank controversy in Boston begins with the publication of *A Projection for Erecting a Bank of Credit in Boston, New-England. Founded upon Land Security*. Several other pamphlets follow.

1716

An anonymous Boston publication, *Some Considerations Upon the several sorts of Banks*, argues that the solution to the town's economic depression is a public works program and government loans to encourage new industry.

English immigrant Thomas Rutt sets up a bloomery forge (a small forge that produces wrought iron) in the Manatawny region of Pennsylvania. Rutt will go on to be a leader in the establishment of the Eastern Pennsylvania iron industry.

1717

The Company of the West, a group headed by the Scots-French financier John Law, takes over Louisiana.

1718

Indigo cultivation begins in Louisiana.

1719

Colonel Alexander Spotswood sets up a blast furnace (used for smelting iron) near Fredericksburg in Virginia, the beginning of the Virginia iron industry. He encourages the immigration of German iron workers.

The Company of the West changes its name to the Company of the Indies. As rumors of gold and diamonds found in Louisiana circulate in Paris, the price of company stock skyrockets.

1720

Approximate date of the founding of the Principio Company, colonial America's largest ironworks. Located in Maryland, it principally serves the British market. Although most of the investors are English, they include Augustine Washington, George Washington's father. Slaves perform much of the work, at first in unskilled and later in skilled positions.

The campaign for a land bank in Boston revives with the publication of John Colman's *The Distressed State of the Town of Boston Considered*. Edward Wigglesworth responds with *A Letter from One in the Country to his Friend in Boston*, advocating hard money and tight credit.

When no gold or diamonds are found in Louisiana, the collapse of the "Mississippi Bubble" in Company of the Indies stock forces John Law to leave France, relinquishing control of the company.

1721

The Puritan minister John Wise publishes *A Word of Comfort to a Melancholy Country* under a pseudonym, advocating paper money and easy credit as beneficial to the rural population.

Another minister, Thomas Paine, replies in *A Discourse Shewing that the Real First Cause of the Straits and Difficulties of this Province of the Massachusetts Bay is its Extravagance, and not Paper Money, and also what is a Safe Foundation to Raise a Bank of Credit on, and what not*. Paine attacks extravagance and vanity, particularly among the lower classes, as the real source of Massachusetts's economic problems.

1722

The White Pines Act, intended to reserve trees for masts for the Royal Navy, requires a permit to fell white pines with a diameter over 24 inches unless on private land.

1723

Frenchman Philippe Renault establishes a lead mine on the west bank of the Mississippi.

1724

The Carpenters' Company of the City and County of Philadelphia is founded. This association of master carpenters and house builders establishes uniform rates for their work.

The master shipwrights of the Thames petition the British government to restrict colonial shipbuilding. Parliament, influenced by English merchants who use colonial-built ships, refuses to intervene.

Parliament's bounty on naval stores expires. The industry quickly collapses in South Carolina, but it persists in North Carolina.

1729

The Quaker merchant Ralph Sandiford's *Mystery of Iniquity*, one of the earliest antislavery writings, is published.

Publication of Benjamin Franklin's *A Modest Enquiry into the Nature and Necessity of a Paper-Currency*, advocating paper money for Pennsylvania. Franklin is appointed the printer of the currency.

Parliament restores some bounties on naval stores.

1730

Prohibitions on exporting rice outside the British Empire are relaxed. This benefits South Carolina rice planters, who develop markets in Southern Europe.

1731

The Baltimore Company is formed. A Maryland group planning to build ironworks, mostly to supply the British market, it will become one of the largest colonial iron manufacturers.

Failure of the Company of the Indies leads to the French government resuming direct rule of Louisiana.

1732

The British Parliament's Hat Act restricts colonial hat makers by limiting each master hat maker to two apprentices and by banning the export of colonial hats. Passed at the behest of London hatters fearing competition, this act proves to be ineffective.

Upon the petition of a group of investors, the Connecticut Assembly charters the New London Society United for Trade and Commerce, originally as a joint-stock trading company, which issues notes. Shortly afterwards, the society is suppressed by the Connecticut government.

1733

The British Parliament's Molasses Act heavily taxes colonial imports of sugar, molasses, and rum from outside the British Empire. The act's goal is to protect British Caribbean sugar from competition with cheap French colonial sugar, but it is easily circumvented.

1734

The Library of the Carpenters' Company of Philadelphia is founded; it is a repository of works on building design, most printed in England.

1735

Slavery is prohibited in the new British colony of Georgia.

The first American insurance company, the Friendly Society for the Mutual Insurance of Houses Against Fire, is founded in Charles Town, South Carolina. It will collapse after being unable to pay for the damage caused by the great Charles Town fire of 1740.

1737

In Boston, an anonymous author publishes *A Proposal to Supply the Trade with a Medium of Exchange and to Sink the Bills of other Governments*; it advocates a Land Bank.

1738

In Boston, the physician William Douglass publishes *An Essay concerning Silver and Paper Currencies, more especially with regard to the British Colonies in New England*, advocating "hard money."

1739

The German immigrant Caspar Wistar builds a successful colonial glass factory, using German workers, in Alloway, New Jersey.

Eliza Lucas begins to experiment with indigo cultivation at her father's plantation in South Carolina.

In the Stono slave rebellion in South Carolina, about twenty whites are killed before the rebellion is suppressed.

In December, a scheme for a Land Bank to issue notes backed by real estate is put forth in the Massachusetts General Court.

Two French traders, Pierre and Paul Mallet, arrive in Santa Fe, New Mexico. The Spanish colony, exploited by a cartel of Chihuahua merchants who control trade between New Mexico and Mexico, attempts to establish a connection with the French North American trading network. The Spanish Crown will suppress this trade by 1753.

1740

In the aftermath of the Stono Rebellion, South Carolina establishes a comprehensive slave code with an emphasis on controlling the movement of slaves through a system of passes. The South Carolina code will become a model for other colonies.

The first type foundry in colonial North America is established at Germantown, Pennsylvania. It produces type for German-language presses.

The Massachusetts opponents of the Land Bank put forth a scheme for a bank, the Silver Bank, to issue notes backed by silver. Both the Land Bank and Silver Bank begin to issue notes.

In Boston, William Douglass's *A Discourse Concerning the Currencies of the British Plantations in America, Especially with Regard to Their Paper Money* is published anonymously. Douglass compares the different currency schemes of the colonies, condemns the idea of a Land Bank, and recommends the Silver Bank.

An anonymous paper-money advocate responds to Douglass in *An Inquiry into the nature and uses of money; more especially of the bills of Publick Credit, Old Tenor. Together with a proposal of some proper Relief in the present exigence. To which is added a reply to the Essay on Silver and Paper Currencies*.

Another anonymous Boston pamphlet, *A letter from a Country Gentleman at Boston to his friend in the Country*, advocates a Land Bank.

1741

A lengthy trial and investigation into an alleged "slave conspiracy" in New York City leads to the execution of 29 blacks and four whites, with the transportation of many others.

The Massachusetts Land Bank controversy continues with the publication of the anonymous *A letter to—Merchant in London concerning a late Combination in the province of the Massachusetts-Bay in New England to impose or force a private-Currency called Land-Bank-Money*, which brings forth various replies and vindications.

The British Parliament declares both the Land Bank and the Silver Bank illegal. This act extends the 1720 Bubble Act's prohibition of forming joint-stock companies from Britain itself to the colonies.

1744

Benjamin Franklin gives a model Franklin stove to the iron founder Robert Grace; he helps publicize the new stoves when they are built.

In South Carolina, Eliza Lucas harvests her first successful production crop of indigo.

1746

An Address to the Inhabitants of North Carolina on the Want of a Medium in Lieu of Money is published in Williamsburg, Virginia.

1747

A land speculation company, the Ohio Company, is organized in Virginia to claim lands west of the Appalachians.

1749

The British Parliament agrees to subsidize colonial indigo.

1750

The British Parliament passes the Iron Act, encouraging iron imports from America by removing duties on bar and pig iron. To protect British iron businesses, Parliament also forbids colonial enterprises from constructing mills for slitting or rolling iron or making steel. The lifting of the tariff is followed by an increase in American iron exports to Britain, but the prohibitions prove difficult to enforce.

Welsh shoemaker John Adam Dagyr arrives in Lynn, Massachusetts. He will introduce improved techniques for making high-quality shoes and begin Lynn's career as America's shoemaking center.

Around this time, Scottish immigrant Edward Pattison settles in Berlin, Connecticut. He will introduce tinsmithing to the colonies, and Berlin will become the center of colonial tin manufacture.

In Georgia, the ban on slavery is lifted.

1751

Sugar cane is introduced as a new crop in Louisiana.

The Society for Encouraging Industry and Employing the Poor is founded. This Boston group sets up a linen factory to employ poor Boston women and children in spinning, while advertising in Ireland for skilled male weavers. Despite support from Boston's elite, the operation never becomes self-sustaining and collapses by 1759.

The British Parliament removes the tariff from American potash (potassium carbonate), leading to expansion of the industry.

As part of a plan to return the New England colonies to specie currency, Parliament's Currency Act prohibits these colonies from issuing additional bills of credit or passing legal tender laws.

1752

The Sterling ironworks is established in Orange County, New York.

Benjamin Franklin takes the leading role in founding the Philadelphia Contributorship for the Insurance of Houses from Loss by Fire.

1753

The Susquehanna Company, a land speculation company, is formed to press claims to the Wyoming Valley in northern Pennsylvania.

Obadiah Brown of Providence establishes a spermaceti (whale oil) candle works at Tockwotton, Rhode Island.

1754

First mention of a rice-pounding mill in a South Carolina plantation sale.

The Quaker John Woolman denounces slavery in *Some Considerations on the Keeping of Negroes*.

1755

The Schuyler, New Jersey, copper mine, confronted with flooding in its deep shafts, imports from England the first steam engine in America to pump out the water.

1759

Opening of the one of the few lead mines in the British colonies, along the Great Kanawha River in Virginia. Investors include the lieutenant governor of Virginia, Francis Fauquier, and several leading Virginians.

1760

A Philadelphia group of master shoe craftsmen forms the Cordwainers' Fire Company, combining the functions of a trade group and a volunteer fire company.

1761

The United Company of Spermaceti Candles, an association of candle makers in Boston, Providence, Newport, New York, and Philadelphia, is formed to fix the price for spermaceti and allocate the available spermaceti among its members.

1762

In Boston, Thomas Hutchinson's *A Projection for Regulating the Value of Gold and Silver Coins* and Oxenbridge Thatcher's *Considerations on Lowering the Value of Gold Coins within the Province of Massachusetts Bay* are published.

1763

A New York Society of Arts is formed with the goal of fostering an independent American linen industry.

Boston merchants form a Society for Encouraging Trade and Commerce to oppose the renewal of the Molasses Act, due to expire in 1764. The society becomes the central organization of the Boston mercantile community.

An artisans' group, the Ancient and Honorable Mechanical Company of Baltimore, is founded.

1764

Parliament's Currency Act forbids the issuing of bills of credit as money, as well as the reissuing of existing bills. It also establishes a new, superior vice-admiralty court in Nova Scotia with an English judge and jurisdiction over all the British colonies in North America.

Parliament's Revenue Act, usually referred to as the "Sugar Act," replaces the Molasses Act of 1733. The new act lowers the duty on molasses, but heavily taxes sugar, coffee, wine, and other luxury goods in order to support the British Army in America. It also more closely regulates American exports to Britain in general. The Act is more strictly enforced than the Molasses Act, and arouses great resentment among the colonists.

1765

The British Parliament passes the Stamp Act, imposing a tax on printed matter in the colonies.

Efforts to establish hemp in the colonies intensify as Parliament establishes a bounty on it. Edmund Quincy's *Treatise of Hemp Husbandry* is published by command of the Massachusetts Assembly. It contains material on European and American hemp raising, including an account of a large hemp-raising project at Salem, Massachusetts.

Tench Francis's *Considerations on a Paper Currency* is published.

1766

Antonio de Ulloa, the new Spanish governor of Louisiana (which France had ceded to Spain in the Treaty of Paris in 1763), arrives in New Orleans. He will attempt to reorient the economy of the colony from that of the French Empire to the Spanish.

The Philadelphia Quaker schoolteacher Anthony Benezet publishes *Caution and Warning to Great Britain and her Colonies on the Calamitous State of the Enslaved Negroes in the British Dominions*, an influential denunciation of slavery.

Colonial resistance prompts the British Parliament to repeal the Stamp Act.

1767

The British Parliament imposes the Townshend duties on imports to the colonies including lead, paper, glass, and tea.

The Commercial Conduct of the Province of New York Considered, by "A Linen Draper," is published. It advocates the establishment of manufacturing.

1768

Henry William Stiegel founds a glassworks at Manheim, Pennsylvania, planning to manufacture the highest quality glass yet made in America.

The New York Chamber of Commerce, the first such organization in the English-speaking world, is organized and will receive a patent from the Crown in 1770. The chamber turns its attention to regulating the values of the various currencies in circulation in New York.

A revolt in New Orleans forces out the Spanish governor, Antonio de Ulloa. The rebels protest against the policy of orienting Louisiana to the Spanish economy and claim that Ulloa will force them to drink Spanish wine instead of Bourdeaux.

1769

Abel Buell establishes the first American English-language type foundry in Killingworth, Connecticut.

Isaac Doolittle of New Haven is the first American to build a printing press.

Disagreements over the membership fee and other matters in the Carpenters' Company of Philadelphia lead to a split and the creation of a new group, the Friendship Carpenters' Company, with a much lower entrance fee.

A new Spanish governor, Alejandro O'Reilly, reestablishes Spanish control over New Orleans and Louisiana. He forbids commerce with foreign ports and expels many foreign merchants.

1770

The Townshend Duties are repealed, except for the tax on tea.

Alejandro O'Reilly attempts to end the slavery of the Native Americans held by French colonists in Louisiana contrary to Spanish law. Although some are freed, O'Reilly's efforts are mostly unsuccessful.

1771

Master tailors of Philadelphia meet at Carpenters' Hall to form the Taylors' Company of Philadelphia. They plan to fix prices and limit the wages paid to journeymen.

1773

Parliament's Tea Act provides for the shipping of the British East India Company's unsold tea directly to the colonies. This act is protested in the colonies as undercutting American tea importers and reinforcing the tea tax. Tea ships are turned away from major American harbors, and the Boston Tea Party protests the tax on tea.

A chamber of commerce is organized in Charles Town.

1774

Economic failure forces Henry William Stiegel to close his glassworks.

The British Parliament forbids the export to America of tools and machines used in textile production.

Parliament's Boston Port Act (one of the "Intolerable Acts") closes the port of Boston.

The First Continental Congress passes several measures to encourage American manufactures. It also prohibits imports from Britain and promises to discontinue the importation of foreign slaves.

1775

The United Company of Philadelphia for Promoting American Manufactures, which concentrates on textiles, is founded.

Cabel Fox establishes a business to make lampblack for printers' inks in Germantown. The high-quality product eventually becomes known as "Germantown lampblack."

The Continental Congress issues orders to standardize the muskets being manufactured for the Revolutionary War, although manufacturers frequently ignore the specifications.

John Murray, Earl of Dunmore, royal governor of Virginia, offers freedom to slaves willing to fight on the British side in the American Revolution.

1776

The Second Continental Congress passes a resolution against slave importation.

American rebels adopt the Spanish peso as currency.

The Continental army's need for lead to make ammunition leads the Virginia government to take over the Kanawha River mines.

The Scottish professor Adam Smith's *The Wealth of Nations* includes criticism of slavery and British policy towards America.

1777

The British occupation of Philadelphia ends the United Company of Philadelphia for Promoting American Manufactures.

The constitution of Vermont (at the time a district of New York) prohibits slavery.

1778

French entry into the Revolutionary War diverts the Royal Navy from attacks on American shipping, leading to a revival of American international trade.

1780

Pennsylvania passes a law for gradual emancipation of its slave population.

1781

On December 31, Congress incorporates the Bank of North America.

1783

Trade with Great Britain is restored after the Treaty of Paris ends the Revolutionary War.

William E. Burns

Gender Issues

1607

Three vessels from a division of the English Virginia Company make landfall in the Chesapeake Bay, founding Jamestown, the first permanent, surviving English settlement in North America. Of the 108 original members of the expedition, none were women.

Pocahontas, whose real name is Matoaka, is taken and held hostage by the English at Jamestown in retaliation for the capture of Englishmen by her Algonquin tribesmen. John Smith claims that Pocahontas saved his life by intervening with her father, the powerful chief Powhatan, in 1607. While a prisoner, she agrees to marry John Rolfe, perhaps to serve her father's interests by using the marriage to forge an alliance with the English. She becomes a Christian, takes a Biblical name (Rebecca), and travels with Rolfe to England, where she dies as she is preparing to return to America. Her life is an example of one of the critical gender roles both European and Native American women played during the colonial period—that of being given in marriage to seal strategic political, military, and business relationships pursued by male family members.

1620–1621

In an effort to encourage the men of Jamestown to settle down and make them more serious about their profit-generating work, the Virginia Company sends more than 150 women for them to marry. Many of these women are widows or orphans who have little prospect of a secure and happy life without a marriage to a man with property, and they have been recruited because they are healthy and used to hard work. The men of the colony pay the expense of their passage by giving the ships' captains 150 pounds of choice tobacco. For the most part, the women go to work with their husbands on the outlying tobacco farms.

Separatists (Pilgrims) aboard the *Mayflower* found Plymouth Plantation. Of the original 102 passengers, eighteen are women, all married and accompanying their husbands on the voyage. Two of the women give birth either en route or close to the time of landfall, and a third woman has given birth just prior to the voyage and is nursing her child. On the ship the women make clothes and cook, and once they arrive, their first task is to find a way to do the laundry. While the Pilgrim men and some of the crew go to search for a place to build the settlement, the women and children remain on the ship. Of the married women, only four survive the winter, and therefore must assume the cooking and cleaning responsibilities for the entire colony. When the ship *Fortune* arrives in November 1621, these same women will also serve the needs of most of its passengers, as only a few of the new arrivals are women.

1637

The heresy trials of Anne Hutchinson begin. Hutchinson believes she received personal revelations during the 1634 voyage to Massachusetts Bay Colony with her family. Later, with the encouragement of her minister, John Cotton, she leads a regular, large gathering in her home to discuss church doctrine

and the Bible. Her followers begin to contradict the Puritan leadership, even refusing to participate in a war against the Pequot Native Americans, and Hutchinson is brought to trial. Though, on the surface, the trials are about Hutchinson's religious views, they are also about containing her within prescribed gender roles. Cotton withdraws his support, and Hutchinson is judged by Governor Winthrop as "a woman not fit for our society" and "an American Jezebel." She is exiled, even though she is pregnant with her sixteenth child. She, her family, and a group of about sixty followers go to Rhode Island.

1639

The first divorce decree in North America is handed down in Massachusetts.

1641

Massachusetts adopts the "Body of Liberties," part of which declares that husbands should not beat their wives.

1643

Anne Hutchinson, now a 51-year-old widow, moves her fourteen children to an area of Long Island she has purchased from the Dutch, who claim to have bought it from local Native Americans. She and all but one of her children are killed by Algonquin natives the following year.

Goody Armitage is licensed in Massachusetts Bay to own and run an inn, but she is not allowed to serve as its bartender. She is an example of the many kinds of occupations women are beginning to hold, such as barbering for both men and women and running a slaughterhouse.

1648

Margaret Reed Brent asks for the right to vote. She is the first woman in the English colonies to do so. A Catholic, she had emigrated to Maryland from England with her sister and brothers, from whom she acquired 1,000 acres. As a major landowner, Brent serves herself and others as an attorney and frequently appears before the Maryland General Assembly. As he lies dying, Maryland's governor, Leonard Calvert, asks Brent to oversee the selling of his estate to pay the colony's militia. The soldiers had saved the colony by putting down a rebellion but are now becoming mutinous themselves due to the lack of pay. Brent solves the problem through the bold move of selling both the governor's estate and his cattle, for which she gains even greater approval from the General Assembly.

Brent then asks the Assembly for two votes, since she is both a landowner and Lord Baltimore's designated representative, but the Assembly refuses. It was not unusual at the time for women to serve as their own attorneys and to serve as proxy voters for men, usually their husbands, who might have to be absent; likewise, it was normal for male property owners to have a vote. Brent is interesting because she represents all of these categories at once, but she is not given even one vote. She is also an example of the importance of class distinctions, since she does not seek voting rights for all women but rather for herself as a female member of a class that generally already has such privileges. In response to the Assembly's rejection, Brent moves to Virginia in 1650.

1649

The Maryland Toleration Act allows Christians of "any sect" to live and speak according to their convictions. The act uses some of the earliest gender-neutral language, referring to "person or persons" and saying "his or her religion" and "his or her consent."

Massachusetts law considers midwives, physicians, and surgeons to have equal legal standing.

1650

America's first published book of poetry is Anne Dudley Bradstreet's *The Tenth Muse Lately Sprung Up in America*. Unknown to Bradstreet, her work had been taken to London by her brother-in-law in order to get it published. Despite being a mother of eight children, Bradstreet is criticized by other family members for not sticking to needlework, which is considered more in line with her traditional gender role.

1656

Mary Fisher and Ann Austin arrive in Boston. They are part of the first group of Quakers to arrive in America, but Fisher and Austin are promptly banished to the West Indies by the Puritans. Of the fifty-nine in the original Quaker party, twenty-six are women, and all but four of them are unmarried.

Founded in England by George Fox and Margaret Fell as the Religious Society of Friends, the Quakers refuse to tip their hats and speak with deference to their social superiors (including the king) because they argue that God recognizes no social distinctions among people. They support women's separate but equal ministerial status with men and encourage women to preach because they believe God communicates with each person individually by means of an "inner light." They refuse to serve in militia or even pay religious taxes during the English Civil War because they practice nonviolence, and, in 1652, they make the first formal declaration against American slavery.

1660

By 1660 there are 20,000 Quakers in Britain, and many are going out as missionaries. Almost universally despised because of their disavowal of traditional gender, racial, religious, and social hierarchies, Quakers are commonly beaten or put to death. Mary Dyer is hanged in Boston because she insists on practicing Quakerism. One of the few supporters of Anne Hutchinson, she had followed Hutchinson into exile and eventually traveled to England where she became a Quaker. Attracted to the Quakers' radical views on gender roles, Dyer converts and then returns to America to participate in the "Lamb's War" against Puritan civil and religious authority in Massachusetts. Knowing they will almost certainly be killed, such Quakers as Dyer persist in

practicing Quakerism in Massachusetts, repeatedly returning after being deported, until the Puritan leadership feels compelled to execute them to prevent their ideas from spreading. Dyer's execution and that of others will eventually contribute to Parliament's decision to revoke the charter of the Massachusetts Bay Colony in 1684.

1662

Virginia law clarifies the issue of what racial identity should be assigned to children born from the union of English men and black women by declaring the child to be of the same race as its mother.

1675

The year-long war known as King Philip's War begins in June of this year. King Philip is a Wampanoag Indian, whose real name is Metacom and whose father is none other than Massasoit, the Native American who helped the Pilgrim settlers to survive the first cruel winter. Among the Native American leadership is a woman named Wetamoo, who deeply hates the English because she believes they poisoned her husband (Massasoit's son) some ten years earlier. She has replaced her husband as the sachem of the Pocasset band of the Wampanoag, but only about two dozen of her 300 warriors survive the war, and she falls during an escape attempt and drowns. Her head is put on public display at Taunton, Massachusetts. Metacom is also beheaded; his head is displayed at Plymouth, and his family is sold into slavery and sent to the West Indies. Interestingly, the most complete account of Wetamoo's life is by Mary Rowlandson, who had been captured and given to Wetamoo.

1676

Nathaniel Bacon leads a rebellion of backwoods Virginia farmers, along with their women, servants, and slaves. Frustrated in their efforts to attain land and provide for their families, Bacon's "army" defeats Governor Berkeley's militia and burns down Jamestown. Bacon's sudden death from illness, however, contributes to the eventual defeat of this rebellion. Wealthier men set about passing laws that sharply restrict the ability of the landless, women, servants, and slaves to challenge propertied authority, even making gossip a crime. This may have been because spreading rumors was one of the colonial woman's primary means of having a political impact.

Bacon's Rebellion might be seen as a conflict made of different ideas about gender. An eastern Virginia man had to have property, wealth, and the obedience of his social inferiors, all of which he secured through laws. The western Virginia man respected few authorities outside of his own family, whose honor he protected through independent action and violence when necessary.

Kateri Tekakwitha flees the Mohawk tribe where she has been growing up. Her Algonquin-Christian mother had been captured by the Mohawk and taken for a wife. Orphaned by a 1660 smallpox epidemic that left Tekakwitha horribly scarred and partially blind, she later responds to Jesuit missionaries and is baptized a Catholic. Her Mohawk tribesmen are so disapproving that they stone her, and she is nearly killed. She escapes by herself in a canoe by night, eventually arriving at Sault St. Louis on the St. Lawrence River. There, a village of Christian Native Americans takes her in. Tekakwitha becomes known as the "Lily of the Mohawks," a saint to whom local Native Americans pray for miracles, even after her death at the age of 24. She is nominated for beatification in the 1930s.

1682

The Quakers found Pennsylvania. Women and men are considered nearly equal in the Society's hierarchy, and that hierarchy itself is intended to be limited. Women are ordained as ministers and allowed to preach, and Quaker women are involved in leadership and decision-making on issues that relate to other Quaker women, including marriages. The Quakers may be the only sect of the day that holds these views. Many nineteenth-century American reformers will have some kind of Quaker heritage.

1690

Some thirty Boston women receive a license to cut lumber and manufacture fertilizer.

1692

In January, the Salem witchcraft trials begin. Tituba, a Caribbean-African slave girl, tells witchcraft stories to a group of English girls in Salem, Massachusetts, at or near the home of her master, Reverend Samuel Parris. Parris's daughter, Betsy, and her friends then begin acting strangely. When it is suggested they have been "bewitched," the girls begin naming several local people, especially women and including Tituba, as witches. A number of arrests are made and trials begin. Tituba confesses and is sold for an amount equal to the cost of keeping her in prison. Others are eventually set free, but six others, including Bridget Bishop and Rebecca Nurse, are hanged in the summer. Nurse is a 71-year-old mother of eight who had been at odds with the community and has some sort of birthmark. Bishop is in her late 50s or early 60s; married three times and widowed twice, she has no children.

Of the 141 people eventually charged, several die in jail and a total of twenty others (thirteen women and seven men) are executed by September. More trials continue until the spring of 1693, when the governor forces them to stop. A significant number of the accused are old, eccentric, infirm, or have disputes with other members of the community over property and class issues. This illustrates the importance both of gender and class in the kinds of social judgments that could be made about someone in colonial Massachusetts.

1693

The College of William and Mary is founded. It is the second college in North America and is open only to men, despite being named in part for Mary II, Queen of England.

1695

After her husband's death, Dinah Nuthead continues his printing business in St. Mary's and Annapolis, Maryland. Licensed by the General Assembly and approved by the governor, she is the first of several female printers in the English colonies in North America, although she herself never learns to read or write. No item turned out by her press has yet been located, and it is not known for how long she continued to print. She may have been unable to locate a journeyman printer who could help her continue the business.

1697

In March, Hannah Dustin, Mary Neff, and a young boy escape from their Native American captors by butchering nearly a dozen natives who are asleep with their family. Neff is a midwife and Dustin is a mother of twelve. They have been force-marched nearly 100 miles and, in a practice common to both white settlers and the native peoples, the natives killed Dustin's baby daughter by smashing her skull against a tree. The Massachusetts General Assembly gives the three escapees a reward in pounds sterling for the scalps they present.

1700

Records indicate that, especially in the Southern colonies, it is not at all uncommon for women to be pregnant before they are married. Most affected, however, are indentured servant women, who are generally forbidden to marry under the terms of their contracts. Some 20 percent of these seventeenth-century women will have children without being married.

The French construct a fort at Detroit. Because French settlements of this type consist of male soldiers, trappers, and priests, there is often a high degree of cohabitation between the French and Native Americans. This facilitates the French "going native," as opposed to the English settlements' ability to preserve English culture and language through the cohesiveness of the English family. That is, traditional gender roles may be stretched by frontier pressures, but they are still preserved by the family structure in English settlements.

1704

Sarah Kemble Knight makes a six-month business trip from Boston to New York. She goes on horseback and travels alone in the winter, although she is a widow and a mother. Her account of her travels, *The Journal of Madame Knight*, will be published in 1825. Knight looks after her husband's estate and becomes a wealthy shopkeeper, which indicates she is an astute businessperson as well as a clever writer of the picaresque genre. Colonial women of this time quite commonly work side by side with their husbands and manage "male" affairs when the men are away or dead.

1709

Henrietta Johnston becomes America's first female commercial artist when she begins drawing portraits for wealthy Charles Town, South Carolina, residents. Perhaps born in France as Henrietta de Beaulieu, her innovative pastel techniques and the high quality of her work allow her to support her family, something her second husband cannot fully accomplish with his ill health and low pay at St. Philip's Anglican Church. Her skills will become even more important after Reverend Johnston's drowning in 1716, and she is among the first artists in the world to use pastels.

1711

The British expand the slave trade in the city of New York by opening a slave market on Wall Street. Conditions are so deplorable that an African woman protests by murdering her master and his family. She is burned at the stake.

The famous Madame Montour interprets for an Albany meeting of Iroquois with the governor of New York. Born of mixed French and Native American heritage, Montour is rumored to be the captured daughter of Canada's French governor. She has been raised as an Iroquois and has married the powerful Oneida chief Carandowana ("Big Tree"). Gifted with languages and skilled in negotiating, Montour will be energetically courted by both the French and the English through the 1740s. Through her efforts, the Iroquois become more closely allied with the English and cancel their plans to mount a war against the settlers of North Carolina.

1716

Midwives in the colony of New York receive official licenses.

1726

An English court rules that William Penn's second wife, Hannah Callowhill Penn, can keep her husband's remaining lands and title to Pennsylvania, which she desires to will to her children. The suit, which has dragged on since Penn's death in 1718, is brought by the oldest son of Penn's first wife and would result in transfer of the lands and title to someone living in England. Members of the Penn family will continue to govern Pennsylvania until the Revolution, but Hannah will die within a week of the decision. This is perhaps one of the most significant examples of the kinds of gender-based property disputes common throughout colonial America.

1727

The first convent in North America is founded by Ursuline nuns in New Orleans, a settlement founded by the French in 1718. Though the Ursulines are based in Italy, they will serve the French colony by opening a hospital, a school, and an orphanage. They also look after the so-called casket girls, who have been sent from France to marry Frenchmen in colonial Louisiana. "Casket" is an English corruption of the French *cassettes*, which refers to the large hope chests that the girls bring with them. Filled with home-starting necessities and serving as dowry, the chests improve the girls' bargaining position in marriage arrangements, while their marriages will ensure the most enduring French cultural presence in the whole Mississippi Valley.

1730

Deborah Read Rogers arranges a common-law marriage with Benjamin Franklin. Read's husband is missing and presumed remarried and or dead in the West Indies, but without proof, she cannot legally marry another man.

1738

In one of the most stunning examples of how the pressures of colonial life can reveal the full range of the gender role women can fill, Eliza Lucas Pinckney, at age 16, assumes control of her family's plantation near Charles Town, South Carolina. Her father is recalled to the island of Antigua in the West Indies for military service during one of Britain's wars with Spain and France. When he is made governor there, Eliza is left to care for her younger sister and their sickly mother. By the time she marries a widowed judge, Charles Pinckney, in 1744, she has taught her sister and two of their black slaves how to read and write and has single-handedly revolutionized the agricultural industry of South Carolina by developing a hybrid variety of the indigo plant. The war has greatly increased the demand for the blue dye made from indigo, whereas it has stifled the colony's primary export, rice. Pinckney's letters and journals describe daily life and gender relations in great detail. Her sons will become generals and heroes of the Revolutionary War: Charles, a framer of the Constitution, and Thomas, the ambassador to Spain and Britain who negotiates the critical 1795 Treaty of San Lorenzo ("Pinckney's Treaty"). Eliza Lucas Pinckney may be the first European agriculturalist, male or female, in North America.

1749

John Cleland's novel *Fanny Hill* includes lesbian sex, but suggests it as a way that women might prepare for heterosexual intercourse in marriage. Other books, such as *The Ladies' Dispensatory* (1740), offer sexual advice, usually cautioning that lesbianism, like masturbation, could lead to health problems or even death. Although male homosexuality is well documented and severely punished for its perceived betrayal of the male gender role, female homosexuality is not considered to be such a threat and is rarely documented.

1757

An example of the gender differences between Native Americans and Europeans is a meeting between the Cherokee chief Attacullaculla and male officials from South Carolina. The chief criticizes the Carolinians, arguing that all men are born of women, so women should be allowed into the important councils. As with many Native American societies, Cherokee ancestry is traced through the female, not the male line, and property belongs to mothers and daughters instead of the men. Young married couples join the woman's family, not the man's, and women commonly hold leadership positions as shamans.

1764

In the court case *Davey v. Tyner*, the colonial Pennsylvania Supreme Court supports the existing "joint deed system of conveyance" by which a married woman's property is somewhat protected. A wife must give formal verbal consent to a justice of the peace before her property can be sold.

1765

Mary Jemison marries the Seneca chief Hiakatoo. Jemison was born on a ship bound for America. When she was 15 years old, her family was killed by Native Americans in Pennsylvania. This is her second marriage to a Native American, and she has chosen not to live as a white woman. Her skill with languages and her attractiveness to the Seneca (who call her Deh-he-wa-mis, or "Pretty One") bring her an exalted position as a negotiator in the Lake Erie region. She bears a dozen children and dies on her own large estate in 1797 at the very old—for the colonial period—age of 90.

William Blackstone's *Commentaries on the Laws of England* builds upon the earlier work of Edward Coke (1620s) and Matthew Hale (1670s) in validating the application of English common law to emerging legal issues. Common law depends on precedent, that is, the decisions made by past judges and juries. New cases are compared to the older ones, and, unless the details can be shown to be significantly different, the old ruling applies to the new case. Thus, common law seems to strengthen traditional views and slow the pace of cultural change. One aspect of Blackstone's *Commentaries* is his extended definition of the term "coverture," or property laws for women, to include other forms of female identity. An example is whether women can testify against their husbands if, in the eyes of coverture law, they are not two separate people but one married entity. Blackstone's ideas will set the terms of debate on gender issues for the next two centuries.

1772–1775

Mercy Otis Warren publishes her trilogy of plays anonymously between 1772 and 1775. *The Adulateur*, *The Defeat*, and *The Group* are all satires of British rule that use feminine imagery to describe the innocence of the American colonies, but male imagery to show British buffoonery. Her later history of the Revolution will "speak volumes" for the quality of the female mind.

1773

Phillis Wheatley leaves Boston for London, where her book of poetry will be published under the title *Poems on Various Subjects, Religious and Moral*. Since her arrival in Boston as a slave from Gambia in 1761, Wheatley has been warmly received and often not treated as a slave because of her charming personality and widely popular poetry. Even before her book is published, she has been recognized as the first African American poet. However, her fortunes decline, and she is largely forgotten after her master and mistress die, leaving her in poverty.

1774

"Mother Ann" Lee is freed from prison in England and emigrates with her husband and a few other male disciples to New York. As a member of a Quaker

splinter group known as the “Society of Believers” or “Shaking Quakers,” she is imprisoned for preaching on the feminine qualities of God. She has a vision in which she sees herself as the feminine Second Coming of Christ. She and her disciples found a communal, pacifist, utopian community on a farm in New York, where they are persecuted during the Revolution as loyalists.

Fifty-one North Carolina women sign the “Edenton Resolution,” wherein they declare they will neither drink tea nor wear clothing made in England until England repeals the Intolerable Acts. This is an example of two important ways in which women aid the revolutionary cause—they organize support and they police the colonials’ boycotts of English goods.

From September 5 through October 26, the Daughters of Liberty in Philadelphia open their families’ homes to the delegates to the First Continental Congress. Abigail Adams’s correspondence with her husband John will offer one of the most studied examples of gender relationships within the family of an American founding father and future president.

1776

In March, the first month of assembly for the Second Continental Congress that year, Abigail Adams writes these famous words to her husband as he deliberates on the system of laws for the new country being born in revolution: “Remember the Ladies, and be more generous and favourable to them than your ancestors. Do not put such unlimited power into the hands of the Husbands. Remember, all men would be tyrants if they could.... Emancipating all nations, you insist upon retaining absolute power over Wives.... If particular care and attention is not paid to the Ladies, we are determined to foment a Rebellion, and will not hold ourselves bound by any Laws in which we have no voice or Representation.”

1778

On June 28, “Molly Pitcher” (Mary Ludwig Hays McCauley) earns her nickname by carrying water to her soldier husband and other Continental soldiers of his company who are suffering from the heat at the Battle of Monmouth, New Jersey. When her husband is wounded or collapses from the heat, she mans an artillery piece of the 7th Company of Pennsylvania Artillery until the battle’s end. Before the war and her marriage, she had been a domestic servant. She receives a pension from the Pennsylvania legislature in 1822, and her story becomes even more widely known.

1779

Margaret Cochran Corbin receives the first soldier’s pension ever granted to a woman, as the Continental Congress recognizes her for her bravery and sacrifice during the ongoing Revolutionary War. As so many other women have done, Margaret accompanied her husband when he enlisted in the Continental army. During the Battle of Harlem Heights, New York in 1776, after her husband was killed, she assumed his post, firing an artillery piece until she was nearly killed by cannon fire. Receiving severe wounds to her face and upper body, Corbin lost the use of one arm but she will be considered a regular soldier in the Continental army until her discharge in 1783 at the end of the war.

Her example of heroism is also symbolic of the gender role filled by women throughout the colonial period. During this period, women undergo extreme difficulties in order to support their husbands’ endeavors and assume many male-role responsibilities (though not all of their rights) when their husbands are removed from the scene.

1780

The Ladies Association of Philadelphia is organized by Esther De Berdt Reed, the First Lady of Pennsylvania. The Ladies Association quickly becomes the largest revolutionary-era volunteer women’s organization, spreading from New Jersey to South Carolina and taking in more than \$7,000 in gold, mostly by going door to door. The women provide crucial assistance to George Washington’s soldiers, much of which is sent by way of Martha Washington.

1782

Deborah Sampson Gannett becomes the first American woman to enlist on her own in the Continental army. Dressed like a man and resembling the many adolescent boys who have been recruited, she takes the name Robert Shurtleffe (although various sources state his name as Shurtleff, Shurtleffe, and Shurtleffe) and sees action in several battles until she is wounded at Tarrytown, New York. When she is taken to the hospital, her ruse is uncovered, and George Washington himself discharges her in 1783. After the war, she receives a pension and travels as a lecturer, telling exaggerated stories of her military exploits.

Ryan L. Ruckel

Military and Diplomatic Affairs

1453

The Turks capture Constantinople, destroying the last vestiges of the Byzantine Empire. The loss of that city will leave Eastern Europe and much of the

Mediterranean vulnerable to Turkish attack.
